6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6

Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	86.34672142
Active commuting	8.161170281
Social	—
2-parent households	29.38534582

Voting	73.38637239
Neighborhood	—
Alcohol availability	87.1423072
Park access	51.00731426
Retail density	9.110740408
Supermarket access	10.57359168
Tree canopy	85.29449506
Housing	—
Homeownership	77.15898884
Housing habitability	49.54446298
Low-inc homeowner severe housing cost burden	35.91684845
Low-inc renter severe housing cost burden	3.708456307
Uncrowded housing	96.93314513
Health Outcomes	—
Insured adults	30.92518927
Arthritis	0.0
Asthma ER Admissions	46.4
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	16.7
Cognitively Disabled	5.2
Physically Disabled	5.0
Heart Attack ER Admissions	10.8

Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0
Pedestrian Injuries	59.1
Physical Health Not Good	0.0
Stroke	0.0
Health Risk Behaviors	—
Binge Drinking	0.0
Current Smoker	0.0
No Leisure Time for Physical Activity	0.0
Climate Change Exposures	—
Wildfire Risk	87.1
SLR Inundation Area	0.0
Children	65.5
Elderly	25.8
English Speaking	82.2
Foreign-born	0.7
Outdoor Workers	31.4
Climate Change Adaptive Capacity	—
Impervious Surface Cover	94.7
Traffic Density	3.7
Traffic Access	23.0
Other Indices	—
Hardship	62.9
Other Decision Support	—
2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Based on Client Provided data and construction schedule
Construction: Off-Road Equipment	Client Provided construction equipment list When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications
Construction: Trips and VMT	Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.

Operations: Vehicle Data	No trips data available
Operations: Architectural Coatings	SCAQMD Rule 1113
Construction: Dust From Material Movement	Export expected per Project data
Construction: Architectural Coatings	SCAQMD Rule 1113
Operations: Energy Use	Electricity adjusted based on client provided data
Operations: Water and Waste Water	Taken from 2022 Lake Analysis report

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15309-Lake Pipeline (Mitigated)
Construction Start Date	5/1/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	1.80
Location	34.269428, -116.815824
County	San Bernardino-South Coast
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5156
EDFZ	10
Electric Utility	Bear Valley Electric Service
Gas Utility	Southwest Gas Corp.
App Version	2022.1.1.18

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

User Defined Linear	3.78	Mile	2.06	0.00	—	—	—	—
Other Non-Asphalt Surfaces	1.00	Acre	1.00	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications

Construction: Trips and VMT	13 haul trucks and 2 worker trucks accounted for in Linear, Grading & Excavation Phase in addition to default CalEEMod hauling trucks. Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.

Linear, Drainage, Utilities, & Sub-Grade	Vendor	0.00	10.2	HHDT,MHDT
Linear, Drainage, Utilities, & Sub-Grade	Hauling	0.00	20.0	HHDT
Linear, Drainage, Utilities, & Sub-Grade	Onsite truck	—	—	HHDT

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Linear, Grading & Excavation	—	7,020	0.65	0.00	—
Linear, Drainage, Utilities, & Sub-Grade	—	—	0.65	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
User Defined Linear	0.65	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	29.4	565	0.03	< 0.005
2026	29.4	482	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	39.3	annual days of extreme heat
Extreme Precipitation	4.40	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	31.0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	86.34672142
Active commuting	8.161170281

Social	—

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer's specifications
Construction: Trips and VMT	13 haul trucks and 2 worker trucks accounted for in Linear, Grading & Excavation Phase.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1

Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	86.34672142
Active commuting	8.161170281
Social	—
2-parent households	29.38534582
Voting	73.38637239

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided schedule
Construction: Off-Road Equipment	Client provided equipment list
Construction: Trips and VMT	Client provided total worker trips and hauling trips which equals 8,000 round trips.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

Land Use	TOG	ROG	NOx	CO	SO2	PM10E	PM10D	PM10T	PM2.5E	PM2.5D	PM2.5T	BCO2	NBCO2	CO2T	CH4	N2O	R	CO2e

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.1	annual days of extreme heat
Extreme Precipitation	8.60	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	32.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A

Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	98.7
AQ-PM	4.43
AQ-DPM	1.14
Drinking Water	70.5
Lead Risk Housing	65.1
Pesticides	4.55
Toxic Releases	18.1
Traffic	3.04
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	1.80
Impaired Water Bodies	90.1
Solid Waste	75.7
Sensitive Population	—
Asthma	26.6
Cardio-vascular	44.6
Low Birth Weights	67.2
Socioeconomic Factor Indicators	—
Education	9.73
Housing	12.8
Linguistic	0.26
Poverty	55.9

Unemployment	35.0

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	53.62504812
Employed	15.8475555
Median HI	38.16245348
Education	—
Bachelor's or higher	57.65430515
High school enrollment	0.372128834
Preschool enrollment	1.873476197
Transportation	—
Auto Access	44.50147568
Active commuting	57.28217631
Social	—

Alcohol availability	85.88476838
Park access	61.54240985
Retail density	2.078788656
Supermarket access	11.39484152
Tree canopy	94.22558707
Housing	—
Homeownership	62.4534839

Housing habitability	66.86770178
Low-inc homeowner severe housing cost burden	47.83780316
Low-inc renter severe housing cost burden	50.78916977
Uncrowded housing	77.4541255
Health Outcomes	—
Insured adults	70.78147055
Arthritis	0.0
Asthma ER Admissions	68.5
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	87.1
Cognitively Disabled	32.0
Physically Disabled	7.5
Heart Attack ER Admissions	26.6
Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0
Pedestrian Injuries	97.6
Physical Health Not Good	0.0
Stroke	0.0
Health Risk Behaviors	—
Binge Drinking	0.0
Current Smoker	0.0

No Leisure Time for Physical Activity	0.0
Climate Change Exposures	—
Wildfire Risk	72.7
SLR Inundation Area	0.0
Children	75.0
Elderly	8.4
English Speaking	75.9
Foreign-born	3.5
Outdoor Workers	55.8
Climate Change Adaptive Capacity	—
Impervious Surface Cover	98.3
Traffic Density	2.9
Traffic Access	23.0
Other Indices	—
Hardship	33.2
Other Decision Support	—
2016 Voting	97.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	24.0
Healthy Places Index Score for Project Location (b)	21.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Characteristics: Project Details	Rural Big Bear
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client provided schedule When using construction equipment greater than 150 horsepower (>150 hp), the Construction Contractor shall ensure that off-road diesel construction equipment complies with the Environmental Protection Agency (EPA)/California Air Resources Board (CARB) Tier 4 emissions standards or equivalent and shall ensure that all construction equipment is tuned and maintained in accordance with the manufacturer’s specifications
Construction: Trips and VMT	Client provided pump station trips

1. Introduction

The Big Bear Area Regional Wastewater Agency (BBARWA), Big Bear City Community Services District (BBCCSD), Big Bear Lake Department of Water and Power (BBLDWP), and Big Bear Municipal Water District (BBMWD), henceforth referred to jointly as the Project Proponents, are proposing to implement the Replenish Big Bear Program. The Project includes upgrades and additions to BBARWA's wastewater treatment plant (WWTP) to produce purified water through full advanced treatment to protect the receiving waters and their beneficial uses. The goal of the Project is to produce full advanced treated water that would be retained within the Big Bear Valley watershed to be used to increase the sustainability of local water supplies. BBARWA will be the lead agency for compliance with the California Environmental Quality Act (CEQA) on behalf of this Project. The Project would involve both state and federal grant funds. Therefore, this Biological Resources Assessment and Jurisdictional Waters Assessment report was prepared in accordance with the standards required by the National Environmental Policy Act (NEPA) and CEQA review processes.

On behalf of Tom Dodson and Associates (TDA), Jacobs Engineering Group, Inc. (Jacobs) has prepared this Biological Resources Assessment (BRA) report for the proposed Replenish Big Bear Program (Project). The BRA fieldwork was conducted by Jacobs's biologist Daniel Smith in June and July of 2022, as well as July of 2023. The purpose of the BRA survey was to address potential effects of the Project on designated Critical Habitats and/or any species currently listed or formally proposed for listing as endangered or threatened under the federal Endangered Species Act (ESA) and/or the California Endangered Species Act (CESA), as well as any species otherwise designated as sensitive by the California Department of Fish and Wildlife (CDFW [formerly California Department of Fish and Game]) and/or the California Native Plant Society (CNPS).

The Project Area was assessed for special status species known to occur locally. Attention was focused on those state and/or federally listed as threatened or endangered species and California Fully Protected species that have been documented in the vicinity of the Project Area, whose habitat requirements are present within or adjacent to the Project Area. Results of the habitat assessment are intended to provide sufficient baseline information to the Project Proponents and, if required, to City, County, or other local government planning officials and federal and state regulatory agencies, including the U.S. Forest Service (Forest Service), U.S. Fish and Wildlife Service (USFWS) and CDFW, respectively, to determine if the Project is likely to affect any special status biological resources and to identify mitigation measures to offset those effects.

In addition to the BRA field survey, Jacobs assessed the Project Area for the presence of state and/or federal jurisdictional waters potentially subject to regulation by the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA), Regional Water Quality Control Board (RWQCB) under Section 401 of the CWA and Porter-Cologne Water Quality Control Act, and CDFW under Section 1600 of the California Fish and Game Code (FGC), respectively.

1.1 Project Location

The overall Project Area consists of the Big Bear Valley, which is situated in the San Bernardino Mountains of San Bernardino County, California (Figures 1-3, Pages 4-6). The proposed Project is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake are in the middle of this Basin. The Project will span just east of Big Bear Lake to the WWTP at Baldwin Lake and then south to Shay Pond, and southeast of Big Bear Lake to the Ski Resort Pond and Sand Canyon Recharge Area. The Project is located within several U. S. Geological Survey (USGS) 7.5 Minute Series Quadrangle maps, including the following: *Big Bear City, Big Bear Lake, Moonridge*. The central point for the proposed Project is the BBARWA WWTP, for which the geographic coordinates of the proposed Project are latitude: 34.268906, longitude: -116.815575. The BBARWA WWTP is in Section 7 of Township 2 North, Range 2 East, San Bernardino Base Meridian (SBBM).

Replenish Big Bear Project

1.2 Project Description

BBARWA owns and operates a 4.89 million gallon per day (MGD) capacity WWTP located just south of Baldwin Lake on the east side of the Big Bear Valley. In 2021, the WWTP treated approximately 1.85 MGD of municipal wastewater collected from BBCCSD, the City of Big Bear Lake, and County of San Bernardino Service Area (CSA) 53 in Fawnskin. The existing treatment process includes the following:

- Preliminary treatment consisting of a mechanical coarse screen and an aerated grit chamber.
- Secondary treatment consisting of extended aeration oxidation ditches and secondary clarifiers.
- Solids handling through a dewatering belt filter press.

Treated effluent is temporarily stored on-site prior to discharge to Lucerne Valley. Dewatered solids are hauled off-site. The influent flows to BBARWA's WWTP are comprised of three components:

- Flow from full-time residential homes.
- Flows due to tourism, commercial activities, and part-time residential homes.
- Flows from Infiltration and Inflow (I/I) due to precipitation.

These components create a seasonal variation in the wastewater flows treated at the plant. BBARWA's 2010 Sewer Master Plan (2010 SMP) estimated that the full-time residential rate is 38 percent (%) of the overall customer population within the area. The tourism season is largely concentrated in the months of December through April due the local ski resorts; additionally, the months of June and July also see a slight rise in tourism due to Lake recreation activities. The average daily flow is presently approximately 2.0 MGD and the maximum month flow is 5.4 MGD.

BBARWA's WWTP is located on a 93.5-acre property. The WWTP process components occupy 11.2 acres, and the remaining 82.3 acres include storage ponds and evaporation ponds. Influent flows are conveyed through three BBARWA operated sewer mains and lift stations to the plant. The WWTP currently provides preliminary and secondary treatment.

Treated secondary effluent is discharged to a 480-acre site in Lucerne Valley (LV Site) – about 20 miles north of the Big Bear Valley – for irrigation of fodder and fiber crops that are used as feed for livestock. Use of recycled water for crop irrigation at the LV Site began in 1980 and 100% of the WWTP effluent is currently discharged to the LV Site. Discharge to the LV Site must meet the Colorado River Basin RWQCB Waste Discharge Requirement (WDR), which has an effluent limit for TDS of 550 mg/L over a 12-month period.

1.2.1 Project Purpose and Objectives

Natural precipitation is the only source of recharge and water supply to the Big Bear Valley. Drought conditions and a long-term decline in precipitation trends have led the local water management agencies to investigate opportunities for supplemental water supplies, which are extremely limited due to its isolated location at the top of the Santa Ana River watershed (Figures 1-3, Pages 4-6). As such, the Replenish Big Bear Program has been designed to retain local water in the Valley to increase the sustainability of water supplies. To this end, the Project Proponents intend to implement the Replenish Big Bear Program, which would include the following uses and benefits:

- Purified water would be discharged to Shay Pond to sustain habitat for the state and federally listed as endangered unarmored threespine stickleback fish (*Gasterosteus aculeatus williamsoni*), which is currently sustained using potable groundwater.

- Purified water would be discharged to the Stanfield Marsh Wildlife and Waterfowl Preserve (Stanfield Marsh), providing a consistent water source to sustain habitat and increase education opportunities for the community and visitors.

- Purified water would flow through Stanfield Marsh and provide new inflow to Big Bear Lake to increase inflows and Lake level, enhance recreational opportunities and aquatic habitat, and support water quality improvements.

- When needed, purified water stored in Big Bear Lake would be pumped to Sand Canyon to recharge the groundwater basin to strengthen the sustainability of the groundwater basin.

- Purified water stored in Big Bear Lake could also be used for golf course irrigation and dust control by the Big Bear Mountain Resorts (Resorts) in the summer.

- During wet periods, excess purified water stored in Big Bear Lake could be stored locally as snow, providing flexibility to further enhance winter recreation, reduce spills from Big Bear Lake, augment spring runoff, and increase groundwater recharge. This activity is not currently planned to be implemented as part of the Program, but the Program provides the flexibility to adapt if more extreme hydrologic conditions occur in the future.

- Additional inflow may enable BBMWD to modify their current Big Bear Lake management strategy to minimize spills and optimize releases to enable additional water to be captured downstream for recharge of the San Bernardino Basin, rather than discharged to the ocean.

For redundancy purposes, BBARWA is also seeking to maintain its current discharge location in Lucerne Valley, where undisinfected secondary effluent is currently conveyed to irrigate crops used for livestock feed.

1.2.1.1 Stanfield Marsh and Big Bear Lake

Stanfield Marsh is a 145-acre wildlife preserve that is home to rare and diverse species of birds, fish, amphibians, and mammals. Stanfield marsh is situated immediately east (upstream) of Big Bear Lake and is hydrologically connected to the Lake through a set of culverts under Stanfield Cutoff. Currently, rainfall and snowmelt are the only sources of water for Stanfield Marsh, so the water level varies from season to season and throughout longer hydrologic cycles. During wet periods, Stanfield Marsh is a thriving wildlife preserve. During extended drought conditions, the water level recedes dramatically, sometimes drying up completely, and the wildlife become scarce. In the last 15 years, Stanfield Marsh has been less than half full nearly 40 percent of the time. Full advanced treated water would provide a new, drought proof source of inflow to stabilize the water levels and sustain habitat in Stanfield Marsh even during dry periods. Additionally, overflow from Stanfield Marsh would provide new inflow into the Big Bear Lake and increase Lake levels relative to no Project conditions. The proposed outlets into the Lake at Stanfield Marsh would occur at one of two points just west of the Big Bear Airport (Figure 4, Page 10).

Big Bear Lake is managed by BBMWD, which has rights to the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Bear Valley Mutual (BVM). BVM maintains a storage right and ownership of all water inflow into the Lake. BVM has the right to request Lake releases commensurate with what may be reasonably necessary to meet the requirements of BVM's stockholders, not exceeding 65,000 acre-

feet (AF) in any ten (10) year period. BBMWD can maintain a higher water level in the lake by delivering water to BVM from an alternate source of water. This alternate source of water (In-Lieu Water) comes mainly from the State Water Project through a contract executed in 1996 with San Bernardino Valley Municipal Water District (Valley District).

BBMWD's current Lake Release Policy was adopted in 2006 provides guidance on how BVM demands will be met depending on the Lake level.

- When the Lake is in the top 4 feet, Mutual's demands will be met with Lake releases.
- When the Lake is between 4 and 6 feet below full, Lake releases will be made in the months of November through April and In-Lieu Water will be obtained from May to October.
- When the Lake is more than 6 feet below full, In-Lieu Water will be obtained.

Snowmaking Withdrawals

BBMWD currently has a contract with the Big Bear Mountain Resorts, allowing the withdrawal of an allocated amount of water from the Lake to use for snowmaking purposes. Currently, Big Bear Mountain Resort is authorized to withdraw a maximum of 11,000 AF of water from the Lake over a 10-year rolling period, not exceeding 1,300 AF in any single year. It is calculated that about half of the water withdrawn from the lake for this purpose is returned as runoff.

Fish Protection Releases

In 1995, the State Water Resources Control Board (SWRCB) issued Order No. 95-4, which requires BBMWD and Mutual to release water from the Lake for fishery protection in Bear Creek. Sufficient water must be released from the Lake to maintain specific flow standards, which vary by month and by hydrologic year type (normal, above normal, or below normal precipitation).

FIGURE 4

Stanfield Marsh Discharge Outlets
Replenish Big Bear Project

1.2.1.2 Unarmored Threespine Stickleback Habitat

One of the projected uses of the recycled water generated by the Replenish Big Bear Program would be to provide a continuous water supply to Shay Pond to enhance and maintain habitat for the state and federally listed as endangered unarmored threespine stickleback fish (UTS). The UTS is listed as endangered under both the federal ESA and CESA, as well as a CDFW Fully Protected species. There is a long history of study and group effort regarding the UTS population in the Shay Creek area. The main stakeholders include the USFWS, CDFW, the San Bernardino National Forest (SBNF), BBCCSD, BBLDWP, and BBARWA. The Shay Creek Working Group, which includes representatives from the USFWS, CDFW, SBNF, BBCCSD, BBLDWP, and BBARWA, was formed during the process of preparing the USFWS' 2002 Biological Opinion (BO) for the area. The requirements of the 2002 BO state that BBCCSD will continue to provide water to Shay Pond to maintain a minimum 20-gallon per minute (gpm) outflow from Shay Pond. To meet this outflow requirement, BBCCSD discharges 50 gpm of potable water into the pond. Based on the average volumes of discharges between 2012 and 2020, BBCCSD discharges approximately 50 acre-feet per year (AFY) of potable water into Shay Pond to maintain the UTS population.

The 2002 BO also states that, should a suitable alternative supply of water be found to be appropriate for the stickleback in the future, BBCCSD may use an 'in-lieu' water supply, which could include the use of tertiary-treated water. The proposed Project would provide an in-lieu water supply (i.e., full advanced treated water, which exceeds tertiary treated water) for Shay Pond to meet the requirements of the 2002 BO, which would enable BBCCSD to recover this potable supply to serve their customers. The proposed Project would replace potable water currently discharged to the pond with tertiary-treated water to maintain the water flow through the pond. The objective is to maintain a minimum pond water level that will support suitable habitat conditions for UTS. Up to 80 AFY of purified water would be sent to Shay Pond, and any remaining purified water will be sent to the Stanfield Marsh, which is tributary to Big Bear Lake.

1.2.1.3 Groundwater Recharge at Sand Canyon

The Sand Canyon groundwater recharge project involves extracting Project water stored in Big Bear Lake to a temporary storage pond using existing infrastructure owned by a local resort. The Project water would then be pumped and conveyed to the Sand Canyon recharge area using a new pump station and pipeline, as shown in Figures 5-6, Pages 13-14. The objective of the Sand Canyon recharge project is to recharge the groundwater basin. The following are operation strategies for the Sand Canyon recharge project:

- Recharge will occur within the defined Sand Canyon recharge area.
- Recharge will not occur during periods where natural surface flows occur in the channel.
- Recharge will occur over a 6-month dry weather period (April-October).
- Flows will be reduced or stopped if Project water does not fully percolate within the defined recharged area.

BBLDWP would monitor the discharge and percolation performance as needed to comply with permit requirements for the Sand Canyon recharge operation.

The hatched area along the Sand Canyon channel depicted on Figure 6, Page 14, is where surface water can percolate and still meet the travel time required to the nearest downstream well. The Project water stored in the Lake would have approximately 2,900 linear feet to percolate into the groundwater basin. The Project water is expected to fully percolate before reaching the end of the recharge area. If the Project water does not fully percolate within the defined recharge area, the surface application discharge rate will be reduced using a variable

frequency drive (VFD) on the Sand Canyon Booster Station until the water does percolate within the defined recharge area.

No channel modifications to the channel bottom are anticipated.

When water is needed for recharge in Sand Canyon, it is assumed that the existing Lake pump station owned by Big Bear Mountain Resort (Ski Resort) could be used to transfer water through an existing pipeline into the existing storage pond located at Bear Mountain Ski Resort. These facilities are used primarily for snowmaking in the winter and are expected to be available for the proposed recharge operation, which would only occur from April through October when the resorts are not making snow.

No new infrastructure is needed to extract the Sand Canyon recharge water from the groundwater basin. The Sand Canyon recharge water would become potable groundwater and would be extracted using BBLDWP's existing potable wells located downstream of the recharge area. The wells are located at least six months of travel time from the recharge area, as required by groundwater recharge regulations.

Once pumped out by BBLDWP, the water would be distributed to BBLDWP customers through the existing water distribution system. A portion (approximately 1/3) of the water will be delivered to BBCCSD using existing interconnections between BBCCSD and BBLDWP that are intended for transferring water between the two agencies.

Sand Canyon Recharge Analysis
Replenish Big Bear Project

1.2.1.4 Other Uses

During wet periods, excess water could be stored as snow at the Resorts using their existing snowmaking infrastructure. This would reduce spills from the Lake, keep more of the water in the Valley, and enhance winter recreation by providing additional snowmaking water to the Resorts beyond their current allotment from the Lake. When the snow melts in the spring, runoff would be augmented, which is expected to increase natural groundwater recharge and may improve fish spawning habitat in streams tributary to the Lake.

A new proposed use under the proposed Program is to pump purified water stored in Big Bear Lake from the Bear Mountain intake pump (also owned by the Ski Resort) for landscape irrigation of the Bear Mountain Golf Course located at 43092 Goldmine Drive, Big Bear Lake, CA 92315. Golf course irrigation would keep additional water in the Valley, and the existing snowmaking facilities could also be used to deliver irrigation water to the Bear Mountain Golf Course in the summer, if desired.

Purified water stored in Big Bear Lake could also be used to provide dust control for a bike park at the Snow Summit Ski Resort. Each spring, the Snow Summit Ski resort is transformed into a bike park. Purified water stored in the Lake could be used from April to October for this purpose. It is estimated that about 120 AFY of purified water stored in the Lake could be utilized in support of this use under the proposed Program.

Additional inflows into Big Bear Lake will also provide BBMWD with more flexibility in managing Lake releases, while still maintaining high Lake levels. During wet periods, additional flood control releases are anticipated to flow down the Santa Ana River to the Seven Oaks Dam, which is upstream of the San Bernardino Groundwater Basin area. BBMWD intends to coordinate with San Bernardino Valley Municipal Water District (Valley District) to optimize the volume of releases from Big Bear Lake that can be captured for recharge of the Bunker Hill Basin, rather than flow past to the ocean.

1.2.2 Project Components

The Replenish Big Bear Program would consist of the following six general Project components:

1) Conveyance Pipelines
2) Ancillary Facilities including Monitoring Wells and Pump Stations
3) Evaporation Pond(s)
4) BBARWA WWTP Upgrades
5) Sand Canyon Outlet
6) Solar Energy Facilities

1.2.2.1 Project Component 1: Conveyance Pipelines

The Replenish Big Bear Program could ultimately install a total of about 6.59 miles or 34,810 LF of various types of pipelines, depending on which proposed alignments are selected. Potential alignments include the following:

- Installation of a pipeline to Big Bear Lake (Stanfield Marsh) utilizing one of three proposed alternatives from the WWTP to Stanfield Marsh in the maximum amount of approximately 19,940 LF sized at 12 inches in diameter (Figure 7, Page 17).

- Installation of approximately 710 LF of 4-inch pipeline to reach Shay Pond (UTS Habitat) from either an existing pipeline or a new 6-inch replacement pipeline that would be about 5,600 LF (Figures 8a-8b, Pages 18-19).

- Installation of approximately 7,210 LF of 8-inch pipeline that would convey stored water from an existing snowmaking storage pond to a discharge outlet into Sand Canyon (Figure 5, Page 13).

- Installation of approximately 1,350 LF of 8- to 10-inch brine pipeline from the WWTP pellet reactor to the solar evaporation ponds, all within the BBARWA WWTP property (Figure 9, Page 20).

The WWTP to Big Bear Lake (Stanfield Marsh) conveyance pipeline alternatives depicted on Figure 7, Page 17 as "East Neighborhoods Alternative," West Neighborhoods Alternative," and "Meadow Lane Alternative" would be constructed entirely within existing road right-of-way (ROW). For the pipelines in roadways, the total construction width would be up to 15 feet wide, including area for the trench, spoils pile, and pavement repair area. It should be noted that although the "North Airport Corridor Alternative" was included in this assessment, the Project Proponent is not likely to implement this alternative due to potential conflicts with airport operations.

The approximately 710-foot-long Shay Pond conveyance pipeline is expected to connect to an existing pipeline from the BBARWA WWTP. This new line would be constructed entirely within an existing unpaved road (Cascade Street). Figures 8a-8b on Pages 18-19 show a possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline as well. The Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. However, the replacement pipeline alternative ("Possible Replacement Pipeline Alignment") could be implemented should the existing pipeline be required to be replaced.

The Sand Canyon conveyance pipeline (Figure 5, Page 13) would mostly be constructed in existing road right-of-way, except for approximately 350 feet that would be constructed between two houses, which would require an easement.

FIGURE 9

BBARWA WWTP
Replenish Big Bear Project

1.2.2.2 Project Component 2: Ancillary Facilities including Monitoring Wells and Pump Stations

The Replenish Big Bear Program anticipates the installation of up to four new monitoring wells:

- Installation of one or more monitoring wells at the evaporation pond on the WWTP Site to monitor groundwater quality, as required by the future discharge permit.

- Installation of two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.

The depths of a new wells are anticipated to range between 250 and 750 feet below ground surface, or as directed by the hydrogeologist. The average area of disturbance required to drill and construct each new well is anticipated to be half an acre or less. Drilling of up to four new wells during a given year, with flexibility to construct the four wells over a period of two or more years, will require the delivery and set up of the drilling rig at each site. It is anticipated these wells may be drilled concurrently, or at different times and the drilling equipment will be transported to and from the sites on separate occasions.

Additionally, the Project would require the installation of three pump stations to convey the water or brine generated by the proposed BBARWA WWTP Upgrades:

- Installation of a 50-gpm brine pump station.

- Installation of an anticipated 1,500 to 1,600 gpm pump station at the BBARWA WWTP to pump purified water to Shay Pond and Stanfield Marsh.

- Installation of a new 600 gpm pump station at the snowmaking pond to convey water to Sand Canyon (Figure 5, Page 13).

It is forecasted that, at each site, no more than 0.5 acre will be actively graded on a given day for site preparation of each pump station. Construction of the pump stations would involve site preparation and grading, construction of structural foundations, installation of piping and electrical equipment, pump, and motor installation, and final sitework, as well as the delivery of equipment and materials.

1.2.2.3 Project Component 3: Evaporation Ponds

The Replenish Big Bear Program would include the development of up to 57 acres of solar evaporation ponds, depending on the total system recovery rate achieved, at BBARWA's WWTP site to accommodate 22,000 gpd to 55,000 gpd of brine concentrate (Figure 9, Page 20). Each new pond is anticipated to be 8 to 10 feet deep with berms built up from the existing grade to create pond areas. Single basin dimensions would range from about 400 to 800 feet long and 400 to 800 feet wide, or about 3.75 to 7.5 acres to provide 6 to 10 ponds to accommodate the brine discharged from the treatment process. The berms would be built up so that the top of the berms would be level with the existing grade of the WWTP. This would provide protection from flooding in that area without requiring excavation much below the existing grade in that area.

The evaporation ponds would be constructed using large construction equipment; earthen berms would be installed; and the basins would be lined with an impermeable liner to prevent percolation of the brine into the underlying soil. Construction of the new evaporation ponds will require the delivery and installation of equipment and materials. It is not known whether each site will require import or export of soil, as the new evaporation ponds will require some excavation of the existing area to provide fill dirt for the earthen berms to create the pond areas. Given the size of the proposed 6 to 10 ponds (400 feet to 800 feet wide by 400 feet to 800 feet long

by 10 feet in depth), it is anticipated that a cut amount from 1 to 2-feet of the existing grade will provide enough fill dirt to create the earthen berms of the ponds. Periodically, the residual solids (primarily consisting of salts left after evaporation) would be collected and disposed of at an appropriately licensed disposal facility.

1.2.2.4 Project Component 4: BBARWA WWTP Upgrades

The Replenish Big Bear Program will require significant upgrades to the treatment process at the WWTP to meet stringent discharge requirements for the Big Bear Lake discharge and the Sand Canyon recharge portion. The existing BBARWA WWTP would be upgraded to produce full advanced treated water to serve the objectives outlined in the previous subsections (Figure 9, Page 20). These upgrades would treat wastewater to full advanced treatment at a capacity of 2.2 MGD, or approximately 2,210 AFY. Upgrades that would occur within the BBARWA WWTP are as follows:

- Upgrade the existing oxidation ditches to biological nutrient removal process.
- Tertiary filtration and nutrient removal via denitrification filters.
- Ultrafiltration (UF) and reverse osmosis (RO) membrane filtration.
- Brine pellet reactor for brine minimization.
- Ultraviolet disinfection and advanced oxidation process (UV/AOP).

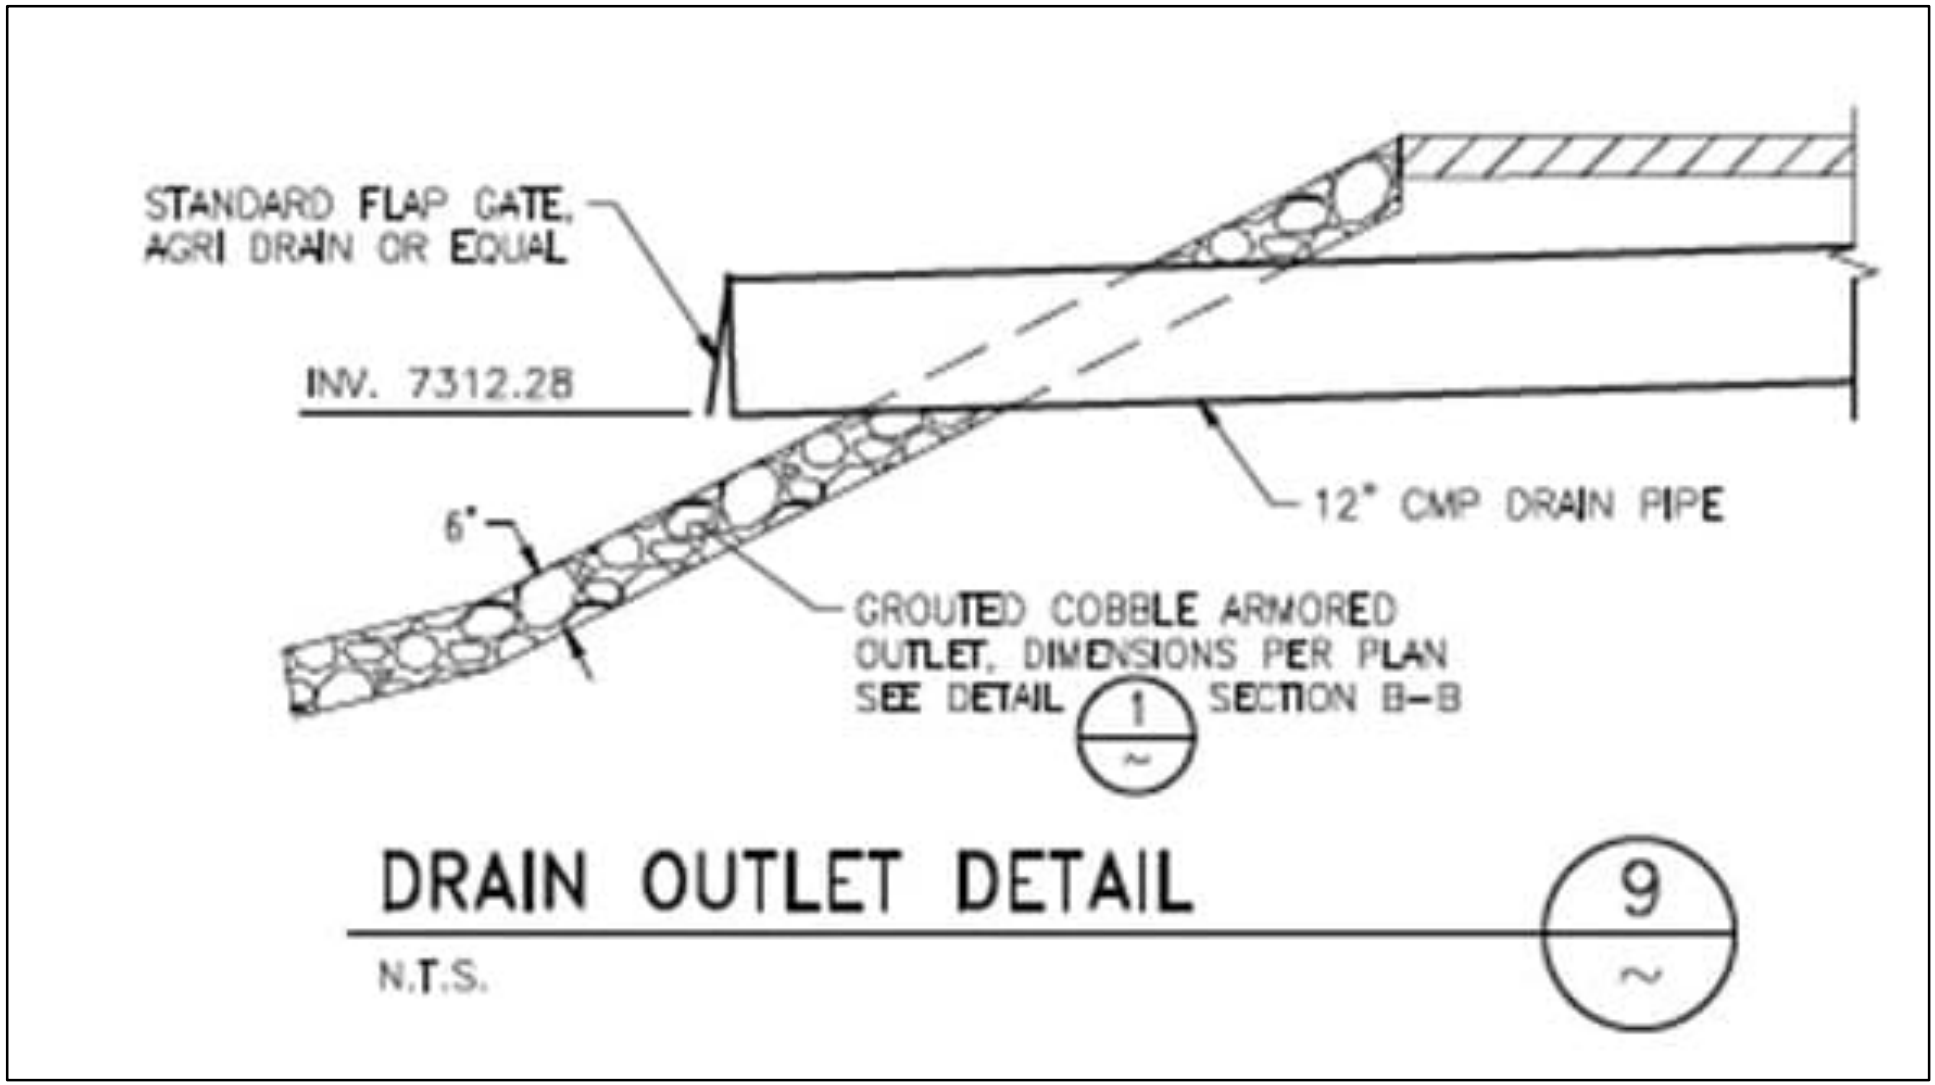
The construction activities to install upgrades at the BBARWA WWTP consists of the following range of activities: demolition of existing concrete basins, grading activities to prepare site for new construction, construction of concrete foundations and supports, installation of piping, equipment, and instrumentation, connection to existing electrical equipment and onsite utility water system construction of building foundations and building structures, and installation of treatment equipment. Civil and site work for the proposed BBARWA WWTP Upgrades would include demolition, grading, drainage, and site improvements. The area around new structures and processes would be backfilled to match existing finished surfaces. All disturbed areas would be paved, covered with crushed stone, or landscaped with ground cover. Areas that require routine vehicle access would be bituminous concrete roadways, consisting of a 12-inch gravel base course, a 2.5-inch bituminous concrete binder course and a 1.5-inch bituminous concrete top course. Areas that require routine pedestrian access would have concrete sidewalks. The sidewalk would consist of 4 inches of reinforced concrete on an 8-inch gravel base course. Painted steel bollards (approximately 4 inches in diameter and 42 inches high) would be provided as needed to protect equipment or structures that are near roadways.

1.2.2.5 Project Component 5: Sand Canyon Outlet

The discharge outlet to Sand Canyon would consist of a pipe outlet at the top of the channel bank that discharges down the side slope of the channel into the channel bottom. The channel slope will be protected from erosion using rip rap or similar erosion control methods, similar to the detail on Figure 10, Page 23.

1.2.2.6 Project Component 6: Solar Energy Facilities

The Project would include the installation of approximately 2.9 acres of new solar facilities (solar panels) within and adjacent the existing BBARWA WWTP (shown in green on Figure 9, Page 20). These new solar facilities would be constructed in previously disturbed areas and would likely require minimal grading and site preparation. Additionally, rooftop solar would be installed on the existing BBARWA Operations and Control building and Administration building.



SOURCE: BBARWA

FIGURE 10

Sand Canyon Discharge Detail
Replenish Big Bear Project

1.3 Environmental Setting

The Project Area is situated east/southeast of Big Bear Lake, in the Big Bear Valley area of the San Bernardino Mountains. The Big Bear Valley area is subject to both seasonal and annual variations in temperature and precipitation. Average annual maximum temperatures peak at 80.8 degrees Fahrenheit (° F) in July and fall to an average annual minimum temperature of 20.3° F in January. Average annual precipitation is greatest from November through April and reaches a peak in January (4.49 inches). Precipitation is lowest in the month of June (0.14 inches). Annual total precipitation averages 21.84 inches and annual total snowfall averages 62.6 inches.

The topography of the proposed Project footprint is flat, being mostly within existing paved roadways, WWTP facilities, and disturbed/graded areas. Much of the proposed Project is within and around Big Bear City, which has an elevation of approximately 6,770 feet above mean sea level (amsl). However, the Sand Canyon Recharge Facilities are within the unincorporated community of Moonridge, which is south of Big Bear City. The Moonridge residential area is a mountain community built on moderate to steep slopes. The elevation of the proposed Sand Canyon Recharge components of the Project ranges from approximately 7,275 feet amsl at the Sand Canyon discharge outlet, to 7,350 feet amsl at the highest point of the proposed conveyance pipeline.

Hydrologically, the Project Area is situated within the Bear Valley and Baldwin Hydrologic Sub-Areas (HSA 801.71 and 801.73). The Bear Valley HSA comprises a 34,333-acre drainage area, within the larger Santa Ana Watershed (HUC 18070203). The Baldwin HSA comprises a 22,789-acre drainage, also within the Santa Ana Watershed. The Santa Ana River is the major hydrogeomorphic feature within the Santa Ana Watershed. One of several tributaries to the Santa Ana River is Bear Creek, which outflows from Big Bear Lake from the Bear Valley Dam located at the westernmost (downstream) end of Big Bear Lake. Big Bear Lake is one of the head waters of the Santa Ana River Watershed.

Soils within the Project Area are comprised of the following:

- *Aquents-Grunney complex, 0 to 4 percent slopes*: Aquents family soils consist of sandy loam and stratified coarse sand, to sand, to sandy loam, to loam horizons comprised of mixed alluvium. This soil type is poorly drained and has been identified as a hydric soil. Grunney family soils consist of muck, mucky loam, and stratified loamy sand, to sandy loam, to silt loam horizons comprised of mixed alluvium. This soil type is also poorly drained and has been identified as a hydric soil. Aquents-Grunney complex, 0 to 4 percent slopes soils are present within the Baldwin Lake and Shay Pond portions of the proposed Project.

- *Moonridge-Shayroad-Caribou creek complex, 0 to 4 percent slopes*: Moonridge family soils consist of loam comprised of alluvium derived from granitoid. This soil type is well drained and has not been identified as a hydric soil. Shayroad family soils consist of sandy loam comprised of alluvium derived from granitoid. This soil type is also well drained and has not been identified as a hydric soil. Caribou creek family soils consist of loam and clay loam horizons comprised of mixed alluvium. Like Moonridge and Shayroad families, Caribou creek soils are well drained and do not have a hydric soil rating. Moonridge-Shayroad-Caribou creek complex, 0 to 4 percent slopes soils are present within the Baldwin Lake portion of the proposed Project.

- *Moonridge-Caribou creek-Urban land complex, 0 to 4 percent slopes*: See preceding description. This soil type is present within the Big Bear Lake (Stanfield Marsh) conveyance pipeline alternatives, except for the "Baldwin Lake Alternative" (Figure 7, Page 17).

- *Garloaf-Caribou creek-Urban land complex, 15 to 30 percent slopes*: See preceding description for Caribou creek family soils. Garloaf family soils consist of very cobbly loam and very cobbly clay loam

horizons comprised of alluvium derived from granitoid. This soil type is well drained and has not been identified as a hydric soil. Garloaf-Caribou creek-Urban land complex, 15 to 30 percent slopes soils are present within the Sand Canyon groundwater recharge portion of the Project, in Moonridge area.

- *Aquents-Riverwash complex, 0 to 4 percent slopes*: See top description for Aquents family soils. This soil type is present within the Sand Canyon groundwater recharge portion of the Project, in Moonridge area.

Please refer to Appendix E for a soil map of the Project Area and surrounding vicinity.

The Big Bear Valley area is comprised of small mountain communities in the SBNF that consist of a mix of residential and commercial development surrounded by undeveloped montane conifer forest (Figures 1-3, Pages 4-6). Existing land use surrounding the proposed Project footprint consists of residential neighborhoods, WWTP facilities, municipal airport, lake (Stanfield Marsh and Baldwin Lake), and open space. Adjacent undeveloped National Forest land supports a mix of montane conifer forests, shrublands, and montane meadow, and ruderal plant communities.

2. Assessment Methodology

2.1 Biological Resources Assessment

Data regarding biological resources in the Project Area were obtained through literature review and field investigation. Prior to performing the surveys, available databases, and documentation relevant to the Project Area were reviewed for documented occurrences of special status species in the Project vicinity (within approximately 3 miles). The USFWS threatened and endangered species occurrence data overlay, USFWS Information for Planning and Consultation System (IPaC), and the most recent versions of the California Natural Diversity Database (CNDDB; *Rarefind 5*) and California Native Plant Society Electronic Inventory (CNPSEI) databases were searched for special status species data in the *Big Bear Lake, Big Bear City, Fawnskin* and *Moonridge* USGS 7.5-Minute Series Quadrangles (Appendix F). These databases contain records of reported occurrences of state and federally listed species or otherwise sensitive species and habitats that may occur within the vicinity of the proposed Project footprint (within approximately 3 miles). Other available technical information on the biological resources of the area was also reviewed including previous surveys and recent findings.

2.1.1 Biological Resources Assessment Field Survey

Jacobs's biologist Daniel Smith conducted a biological resources assessment of the Project Area in June and July of 2022 and made a follow-up survey visit in July of 2023. Much of the Project is expected to be restricted to existing paved roadways and developed WWTP site. However, several Project components would impact areas that have not previously been developed including:

- The "Baldwin Lake Alternative" of the Stanfield Marsh conveyance pipeline from the BBARWA WWTP.
- The "North Airport Corridor Alternative" of the Stanfield Marsh conveyance pipeline from the BBARWA WWTP.
- Approximately 350 LF of the Sand Canyon conveyance pipeline from the existing Ski Resort storage pond.
- The Sand Canyon discharge outlet.
- The Shay Pond discharge outlet.
- The new solar evaporation ponds at the BBARWA WWTP.
- Approximately 2.9 acres of new solar facilities within and adjacent the WWTP.

Therefore, the reconnaissance-level field survey consisted of a pedestrian survey that encompassed 100% visual coverage of the undeveloped aspects of the Project, as well as the road shoulder along the proposed conveyance pipeline alignments, within the developed neighborhoods. No adjacent private properties were accessed during the survey. The purpose of the survey was to assess the Project Area for its potential to support special status species. Wildlife species were detected during field surveys by sight, calls, tracks, scat, and/or other sign. In addition to species observed, expected wildlife usage of the Project Area was determined based on known habitat preferences of regional wildlife species and knowledge of their relative distribution in the area. The focus of the faunal species survey was to identify potential habitat within and adjacent the proposed Project footprint for special status wildlife that may occur in the Project vicinity.

Floristic Botanical Field Survey

A floristic botanical field survey was also conducted by Jacobs's biologist Daniel Smith in June and July of 2022, a follow-up survey in July of 2023. In accordance with the CDFW's March 20, 2018, *Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Sensitive Natural Communities*, the survey was conducted during the appropriate time of year, when the target species were both evident and identifiable. The target species consisted of those state and/or federally listed plant species that have been documented in the Project vicinity (within approximately 3 miles), whose environmental requirements may be present within the Project Area. Target species included:

- Ash-gray paintbrush (*Castilleja cinerea*)
- Big Bear Valley sandwort (*Eremogone ursina*)
- Southern mountain buckwheat (*Eriogonum kennedyi* var. *austromontanum*)
- Cushenbury buckwheat (*Eriogonum ovalifolium* var. *vineum*)
- San Bernardino Mountains bladderpod (*Physaria kingii* ssp. *bernardina*)
- San Bernardino blue grass (*Poa atropurpurea*)
- Bird-foot checkerbloom (*Sidalcea pedata*)
- California dandelion (*Taraxacum californicum*)
- Slender-petaled thelypodium (*Thelypodium stenopetalum*)

Prior to conducting the survey, Mr. Smith visited multiple reference sites within the Big Bear Valley area, where the target species are known to occur, to determine whether the target species were identifiable at the time of the survey and to obtain a visual image of the target species, associated habitat, and associated natural communities. The reference sites that were visited prior to survey included previously documented occurrences within the Big Bear Valley area, near the Aspen Glen Picnic Area (Big Bear Valley sandwort); the Eagle Point Rare Plant Preserve (ash-gray paintbrush, southern mountain buckwheat, bird-foot checkerbloom, California dandelion, and slender-petaled thelypodium); North Baldwin Meadow (San Bernardino blue grass); SBNF land northwest of the North Shore Drive/Division Drive intersection (Cushenbury buckwheat); and SBNF land in the vicinity of Holcomb Valley/Caribou Creek (San Bernardino Mountains bladderpod). All target species were evident and identifiable at the reference sites prior to the 2022 and 2023 survey visits. During the surveys, 100% visual coverage of the of the undeveloped aspects of the Project, as well as the road shoulder along the proposed conveyance pipeline alignments, was achieved by walking the proposed Project footprint and road shoulders, within and adjacent where Project related ground disturbance is expected to occur.

2.1.2 Survey Limitations

No private properties were accessed without landowner permission. No focused faunal surveys were conducted, and no small mammal trapping was performed. Approximately 350 LF of the Sand Canyon conveyance pipeline (Figure 5, Page 13) would be constructed between two houses, which would require an easement. Permission from the property owners of these two private residences was not obtained at the time of survey. Therefore, this section of the San Canyon conveyance pipeline alignment was not surveyed. Additionally, the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline (Figures 8a-8b, Pages 18-19) was not surveyed because the Project Proponent does not currently anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. Additional surveys should be conducted prior to implementation of Project activities within either of these two potential alignments, to assess potential Project related impacts to special status species and habitats that may occur in these areas.

2.2 Jurisdictional Waters Assessment

In June of 2022, Mr. Smith also evaluated the Project Area for the presence of riverine/riparian/wetland habitat and jurisdictional waters, i.e., Waters of the U.S. (WOTUS), as regulated by the USACE and RWQCB, and/or jurisdictional streambed and associated riparian habitat as regulated by the CDFW. Prior to the field visits, aerial photographs of the Project Area were viewed and compared with the surrounding USGS 7.5-Minute Topographic Quadrangle maps to identify drainage features within the survey area as indicated from topographic changes, blue-line features, or visible drainage patterns. The USFWS National Wetland Inventory and Environmental Protection Agency (EPA) Water Program "My Waters" Google Earth Pro data layer were also reviewed to determine whether any hydrologic features and wetland areas had been documented within the vicinity of the site. Similarly, the United States Department of Agriculture (USDA) – Natural Resources Conservation Service (NRCS) Web Soil Survey was reviewed for soil types found within the Project Area to identify the soil series in the area and to check these soils to determine whether they are regionally identified as hydric soils. Upstream and downstream connectivity of surface waters (if present) were reviewed on Google Earth Pro aerial photographs and topographic maps to determine jurisdictional status. The lateral extent of potential USACE jurisdiction was measured at the Ordinary High Watermark (OHWM) in accordance with regulations set forth in 33CFR part 328 and the USACE guidance documents listed below:

- *USACE Wetlands Research Program Technical Report Y-87-1 (on-line edition), Wetlands Delineation Manual, Environmental Laboratory, 1987 (Wetland Delineation Manual).*
- *USACE Minimum Standards for Acceptance of Preliminary Wetlands Delineations, November 30, 2001 (Minimum Standards).*
- *USACE Jurisdictional Determination Form Instructional Guidebook, May 30, 2007 (JD Form Guidebook).*
- *USACE Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region (Version 2.0), May 2010.*
- *USACE A Guide to Ordinary High-Water Mark (OHWM) Delineation for Non-Perennial Streams in the Western Mountains, Valleys, and Coast Region of the United States, August 2014 (Delineation Manual).*

To be considered a *jurisdictional wetland* under the federal CWA, Section 404, an area must possess three (3) wetland characteristics: hydrophytic *vegetation*, hydric *soils*, and wetland *hydrology*.

- *Hydrophytic vegetation*: Hydrophytic vegetation is plant life that grows, and is typically adapted for life, in permanently or periodically saturated soils. The hydrophytic vegetation criterion is met if more than 50 % of the dominant plant species from all strata (tree, shrub, and herb layers) is considered hydrophytic. Hydrophytic species are those included on the 2018 National Wetland Plant Lists for the Arid West Region (USACE 2018). Each species on the lists is rated with a wetland indicator category, as shown in Table 1 (below). To be considered hydrophytic, the species must have *wetland indicator status*, i.e., be rated as OBL, FACW or FAC.

Table 1. Wetland Indicator Vegetation Categories

Category	Probability
Obligate Wetland (OBL)	Almost always occur in wetlands (estimated probability >99%)
Facultative Wetland (FACW)	Usually occur in wetlands (estimated probability 67 to 99%)
Facultative (FAC)	Equally likely to occur in wetlands and non-wetlands (estimated probability 34 to 66%)
Facultative Upland (FACU)	Usually occur in non-wetlands (estimated probability 67 to 99%)
Obligate Upland (UPL)	Almost always occur in non-wetlands (estimated probability >99%)

- *Hydric Soil*: Soil maps from the USDA-NRCS Web Soil Survey (USDA 2021) were reviewed for soil types found within the Project Area. Hydric soils are saturated or inundated long enough during the growing season to develop anaerobic conditions that favor growth and regeneration of hydrophytic vegetation. There are several indirect indicators that may signify the presence of hydric soils including hydrogen sulfide generation, the presence of iron and manganese concretions, certain soil colors, gleying, and the presence of mottling. Generally, hydric soils are dark in color or may be gleyed (bluish, greenish, or grayish), resulting from soil development under anoxic (without oxygen) conditions. Bright mottles within an otherwise dark soil matrix indicate periodic saturation with intervening periods of soil aeration. Hydric indicators are particularly difficult to observe in sandy soils, which are often recently deposited soils of flood plains (entisols) and usually lack sufficient fines (clay and silt) and organic material to allow use of soil color as a reliable indicator of hydric conditions. Hydric soil indicators in sandy soils include accumulations of organic matter in the surface horizon, vertical streaking of subsurface horizons by organic matter, and organic pans.

  The hydric soil criterion is satisfied at a location if soils in the area can be inferred or observed to have a high groundwater table, if there is evidence of prolonged soil saturation, or if there are any indicators suggesting a long-term reducing environment in the upper part of the soil profile. Reducing conditions are most easily assessed using soil color. Soil colors were evaluated using the Munsell Soil Color Charts (Munsell 2000). Soil pits are dug (when necessary) to an approximate depth of 16-20 inches to evaluate soil profiles for indications of anaerobic and redoximorphic (hydric) conditions in the subsurface.

- *Wetland Hydrology*: The wetland hydrology criterion is satisfied at a location based upon conclusions inferred from field observations that indicate an area has a high probability of being inundated or saturated (flooded, ponded, or tidally influenced) long enough during the growing season to develop anaerobic conditions in the surface soil environment, especially the root zone (USACE 1987 and USACE 2008).

Evaluation of CDFW jurisdiction followed guidance in the FGC. Specifically, CDFW jurisdiction would occur where a stream has a definite course with a distinguishable bed and bank showing evidence of where waters rise to their highest level and to the extent of associated riparian vegetation.

3. Results

3.1 Existing Biological and Physical Conditions

The proposed Project footprint is within both urban and natural/semi-natural environments. The East Neighborhoods, Meadow Lane, and West Neighborhoods conveyance pipeline alternatives and associated discharge outlets, as well as the Sand Canyon recharge conveyance pipeline and associated discharge outlet, Sand Canyon monitoring wells, and new 600 gpm pump station at the existing Ski Resort snowmaking pond are all situated in a residential development setting (Figure 5, Page 14; Figure 7, Page 18). These conveyance pipeline alignments are entirely within existing disturbed/developed areas including paved roadways. The North Airport Corridor conveyance pipeline alternative is within a public airport setting, surrounded by residential development (Figure 7, Page 18). The remaining monitoring wells, pump stations, and WWTP upgrades are situated within existing developed WWTP facilities (Figure 9, Page 21). The proposed solar energy facilities would be constructed on existing rooftops and adjacent previously disturbed/graded areas around the BBARWA WWTP (Figure 9, Page 21).

The Baldwin Lake conveyance pipeline alternative follows an existing unpaved trail alignment (West Baldwin Lake Trail) within montane meadow, shrubland, and temporarily to seasonally flooded lacustrine habitats (Figure 7, Page 18). The Shay Pond conveyance pipeline would be constructed within an existing unpaved road (Cascade Street) surrounded by rural residential development and montane meadow habitat (Figure 8b, Page 19). The proposed evaporation ponds would be constructed on BBARWA WWTP property, within a previously disturbed/graded section of Baldwin Lake consisting of temporarily to seasonally flooded lacustrine habitat (Figure 9, Page 21).

Disturbances in the Project Area consist mostly of vehicular traffic and pedestrian use associated with the existing roads and residential developments, as well as existing utility infrastructure (i.e., the BBARWA WWTP) and associated WWTP operations. Other disturbances include feral livestock grazing in the vicinity of Shay Pond, domestic livestock grazing on the BBARWA WWTP property, disturbances associated with ongoing airport maintenance and operations at the Big Bear City Airport, vegetation removal/weed abatement, and illegal dumping.

3.1.1 Habitat

Habitats present within and/or adjacent the Project Area include:

- *Pinus jeffreyi* Forest & Woodland Alliance (Jeffrey pine forest and woodland)
- *Juniperus grandis* Woodland Alliance (mountain juniper woodland)
- *Artemisia tridentata* Shrubland Alliance (big sagebrush)
- *Schoenoplectus acutus* Herbaceous Alliance (hardstem bulrush marsh)
- wet montane meadow habitat
- temporarily to seasonally flooded lake (Baldwin Lake)

Sand Canyon Recharge

The undeveloped SBNF adjacent the Sand Canyon recharge conveyance pipeline and associated discharge outlet, Sand Canyon monitoring wells, and new 600 gpm pump station at the existing Ski Resort snowmaking pond supports mixed Jeffrey pine forest and woodland and mountain juniper woodland habitats. The Jeffrey pine forest and woodland habitat is characterized by an open to continuous tree canopy, with a sparse to intermittent shrub layer and varied herbaceous layer (Sawyer et al. 2009). The mountain juniper woodland habitat is characterized by an open to intermittent tree canopy, with a sparse to intermittent shrub layer and sparse or

grassy herbaceous layer (Sawyer et al. 2009). Dominant or otherwise conspicuous species in these plant communities include Jeffrey pine (*Pinus jeffreyi*), Sierra juniper (*Juniperus grandis*), California black oak (*Quercus kelloggii*), white fir (*Abies concolor*), manzanita (*Arctostaphylos* spp.), common sagebrush (*Artemisia tridentata*), and desert mountain mahogany (*Cercocarpus ledifolius*).

Shay Pond

The habitat surrounding the Shay Pond conveyance pipeline alignment (Cascade Street) and discharge outlet consists of a mosaic of ruderal vegetation, big sagebrush, and wet montane meadow habitat. The big sagebrush habitat within this area is characterized by an open canopy, with a sparse to intermittent shrub layer dominated by common sagebrush (*Artemisia tridentata*) and an intermittent grassy herbaceous layer (Sawyer et al. 2009). The wet montane meadow habitat in this area is dominated by sedge (*Carex* spp.), rush (*Juncus* spp.), and beardless wild rye (*Elymus triticoides*). Non-native and ruderal vegetation within this area consists mostly of brome grasses (*Bromus* spp.), Russian thistle (*Salsola tragus*), and tumble mustard (*Sisymbrium altissimum*).

Baldwin Lake

The habitat surrounding the Baldwin Lake conveyance pipeline alternative consists of temporarily to seasonally flooded lake at the eastern end of the proposed alignment, transitioning to wet montane meadow habitat toward the middle of the alignment, and big sagebrush habitat near the western end of the alignment. Dominant species within these plant communities include fox tail barley (*Hordeum jubatum*), summer cypress (*Kochia scoparia*), prickly lettuce (*Lactuca serriola*), *Carex* spp., *Juncus* spp., beardless wild rye, and common sagebrush, respectively.

The proposed solar evaporation ponds would be constructed within a previously disturbed/graded section of Baldwin Lake consisting of temporarily to seasonally flooded lacustrine habitat. Plant communities in this area consist of hardstem bulrush marsh dominated by tule (*Schoenoplectus acutus*), wet montane meadow habitat dominated by *Carex* spp. and *Juncus* spp., and ruderal vegetation dominated by goosefoot (*Chenopodium chenopodioides*), fox tail barley, summer cypress, and prickly lettuce.

The proposed solar energy facilities would be constructed on existing rooftops and adjacent previously disturbed/graded areas around the BBARWA WWTP consisting of bare ground and ruderal vegetation dominated by *Bromus* spp., Coastal heron's bill (*Erodium cicutarium*), summer cypress, prickly lettuce, and tumble mustard.

Please refer to Appendix C for a complete list of all plant species observed on site during surveys.

3.1.2 Wildlife

The proposed Project footprint is mostly within existing residential and commercial developments and the only species expected to occur within these areas are those adapted to an urban environment. During the survey, special attention was focused on those Project components that are within or immediately adjacent undeveloped areas, where special status species are more likely to occur, including the Baldwin Lake conveyance pipeline alternative, the proposed evaporation ponds and solar energy facilities sites, the Shay Pond conveyance pipeline and discharge outlet site, and the Sand Canyon discharge outlet site.

Amphibians and Reptiles

The only amphibian species observed or otherwise detected within the Project Area during the reconnaissance level survey was the California toad (*Anaxyrus boreas halophilus*). Reptile species observed within the Project Area during survey included Skilton's skink (*Plestiodon skiltonianus skiltonianus*) and southern sagebrush lizard

(*Sceloporus graciosus vandenburgianus*). Other common herp species expected to occur within the Project Area include southern Pacific rattlesnake (*Crotalus oreganus helleri*), San Diego alligator lizard (*Elgaria multicarinata webbii*), San Diego gophersnake (*Pituophis catenifer annectens*), Great Basin fence lizard (*Sceloporus occidentalis longipes*), and mountain gartersnake (*Thamnophis elegans elegans*).

Birds

Birds were the most observed wildlife group during survey and species observed or otherwise detected in the Project Area during the reconnaissance level survey included:

- Red-winged Blackbird (*Agelaius phoeniceus*)
- Mallard (*Anas platyrhynchos*)
- Bufflehead (*Bucephala albeola*)
- Killdeer (*Charadrius vociferus*)
- Northern Flicker (*Colaptes auratus*)
- Common Raven (*Corvus corax*)
- Steller's Jay (*Cyanocitta stelleri*)
- Horned Lark (*Eremophila alpestris*)
- Brewer's Blackbird (*Euphagus cyanocephalus*)
- American Coot (*Fulica americana*)
- House Finch (*Haemorhous mexicanus*)
- Dark-eyed Junco (*Junco hyemalis*)
- American Wigeon (*Mareca americana*)
- Acorn Woodpecker (*Melanerpes formicivorus*)
- Brown-headed Cowbird (*Molothrus ater*)
- Ruddy Duck (*Oxyura jamaicensis*)
- Savannah Sparrow (*Passerculus sandwichensis*)
- Cliff Swallow (*Petrochelidon pyrrhonota*)
- Eared Grebe (*Podiceps nigricollis*)
- Pied-billed Grebe (*Podilymbus Podiceps*)
- Mountain Chickadee (*Poecile gambeli*)
- Western Bluebird (*Sialia mexicana*)
- Pygmy Nuthatch (*Sitta pygmaea*)
- Violet-green Swallow (*Tachycineta thalassina*)
- American Robin (*Turdus migratorius*)

Mammals

Mammal species observed or otherwise detected within the Project Area during the reconnaissance level survey included coyote (*Canis latrans*), California ground squirrel (*Otospermophilus beecheyi*), western gray squirrel (*Sciurus griseus*), Botta's pocket gopher (*Thomomys bottae*). Other common mammal species expected to occur within the Project Area include bobcat (Lynx rufus), Merriam's chipmunk (*Neotamias merriami*), mule deer (*Odocoileus hemionus*), raccoon (*Procyon lotor*), and American black bear (*Ursus americanus*). Additionally, numerous feral donkeys (*Equus asinus*) were observed during survey in the vicinity of Shay Pond and several domestic cattle were observed on Baldwin Lake at the BBARWA WWTP.

3.2 Special Status Species and Habitats

According to the CNDDB, 102 special status species (73 plant species, 29 animal species) and two sensitive habitats have been documented in the *Big Bear Lake, Big Bear City, Fawnskin* and *Moonridge* USGS 7.5-Minute Series Quadrangles. This list of special status species and habitats includes any state and/or federally listed threatened or endangered species, California Fully Protected species, CDFW designated Species of Special Concern (SSC), and otherwise Special Animals. "Special Animals" is a general term that refers to all the taxa the CNDDB is interested in tracking, regardless of their legal or protection status. This list is also referred to as the list of "species at risk" or "special status species." The CDFW considers the taxa on this list to be those of greatest conservation need.

The USFWS IPaC search identified three additional special status species as potentially occurring in the regional vicinity of the proposed Project. Of the 105 special status species identified by the CNDDB and IPaC queries, 21 are state and/or federally listed or proposed for listing as threatened or endangered species. Table 2 (below) provides a list of all state and/or federally listed or proposed threatened and endangered species identified by the CNDDB and IPaC queries, where they are found (locally, adjacent to the proposed Project footprint, or within the proposed Project footprint), if suitable habitat for that species exists within the Project Area and whether the Project may affect that species.

Table 2. Listed Species Documented in the Project Vicinity

Common Name	Scientific Name	Status	Found Locally	Found Adjacent	Found Within	Suitable Habitat	Project Affect
Plants:							
Cushenbury oxytheca	*Acanthoscyphus parishii* var. *goodmaniana*	FE	No	No	No	None	No effect
Cushenbury milk-vetch	*Astragalus albens*	FE	No	No	No	None	No effect
ash-gray paintbrush	*Castilleja cinerea*	FT	Yes	Yes	No	Yes	No effect
Big Bear Valley sandwort	*Eremogone ursina*	FT	Yes	No	No	None	No effect
Parish's daisy	*Erigeron parishii*	FT	No	No	No	None	No effect
southern mountain buckwheat	*Eriogonum kennedyi* var. *austromontanum*	FT	Yes	No	No	None	No effect
Cushenbury buckwheat	*Eriogonum ovalifolium* var. *vineum*	FE	Yes	No	No	None	No effect
San Bernardino Mountains bladderpod	*Physaria kingii* ssp. *bernardina*	FE	No	No	No	None	No effect

Common Name	Scientific Name	Status	Found Locally	Found Adjacent	Found Within	Suitable Habitat	Project Affect
San Bernardino blue grass	*Poa atropurpurea*	FE	Yes	Yes	No	Yes	No effect
bird-foot checkerbloom	*Sidalcea pedata*	FE/SE	Yes	Yes	Yes	Yes	May affect, and is likely to adversely affect
California dandelion	*Taraxacum californicum*	FE	Yes	Yes	No	Yes	No effect
slender-petaled thelypodium	*Thelypodium stenopetalum*	FE/SE	Yes	Yes	No	Yes	No effect
Insects:							
quino checkerspot butterfly	*Euphydryas editha quino*	FE	No	No	No	None	No effect
Amphibians:							
southern mountain yellow-legged frog	*Rana muscosa*	FE/SE	No	No	No	None	No effect
Fish:							
unarmored threespine stickleback	*Gasterosteus aculeatus williamsoni*	FE/SE	Yes	Yes	No	Adjacent	May affect, but not likely to adversely affect
steelhead - southern California DPS	*Oncorhynchus mykiss irideus* pop. 10	FE	No	No	No	None	No effect
Birds:							
southwestern willow flycatcher	*Empidonax traillii extimus*	FE/SE	No	No	No	None	No effect
bald eagle	*Haliaeetus leucocephalus*	FD/SE	Yes	Yes	No	Adjacent	May affect, but not likely to adversely affect
California spotted owl	*Strix occidentalis occidentalis*	FPE	No	No	No	None	No effect
Reptiles:							
southern rubber boa	*Charina umbratica*	ST	Yes	No	No	Yes	May affect, but not likely to adversely affect
Mojave desert tortoise	*Gopherus agassizii*	FT/ST	No	No	No	None	No effect

Notes:
FE = Federally Endangered
FT = Federally Threatened
SE = State Endangered
ST = State Threatened

FD = Federally Delisted
FPE = Federally Proposed Endangered

The aquatic habitats required by southern mountain yellow-legged frog are absent from the Project Area and this species is considered extirpated from the Big Bear Valley (USFWS 2019). Likewise, the Project Area is outside the current range of the southern California steelhead (NMFS 2023). Additionally, the habitats required by southwestern willow flycatcher (i.e., riparian) and Mojave desert tortoise (i.e., desert scrub/desert woodland) are absent from the Project Area and these species have not been documented in the Project vicinity (within approximately 3 miles). Therefore, no further discussion of these species is warranted.

Although not a state or federally listed species, the San Bernardino flying squirrel (*Glaucomys sabrinus californicus*) is a CDFW SSC and is considered a particularly sensitive species within the region. Furthermore, this species has been documented in the Project vicinity (within approximately 3 miles). Therefore, San Bernardino flying squirrel will be included in the discussion below, along with the state and/or federally listed species that have been documented in the Project vicinity.

An analysis of the likelihood for occurrence of all CNDDB special status species documented in the *Big Bear Lake, Big Bear City, Fawnskin,* and *Moonridge* quads is provided in Appendix A. This analysis considers species' range as well as documentation within the vicinity of the Project Area and includes the habitat requirements for each species and the potential for their occurrence on site, based on required habitat elements and range relative to the current site conditions. A complete list of all special status species identified by the IPaC, CNDDB, and CNPSEI databases as potentially occurring in the Project vicinity is provided in Appendix F.

3.2.1 Special Status Species

The only state and/or federally listed threatened or endangered species observed in the Project Area during survey was the state and federally listed as endangered bird-foot checkerbloom (see discussion below). However, there is habitat within the Project Area that is suitable to support several other listed species that have been documented in the Project vicinity.

3.2.1.1 Special Status Plants

Cushenbury Milk-vetch – Endangered (Federal)

The federally listed as endangered Cushenbury milk-vetch is a silvery-white (pubescent), short-lived perennial herb in the pea family (Fabaceae). The stems form loose, prostrate mats, up 30 centimeters (11.8 inches) wide. The leaves are pinnately compound with 5 to 9 leaflets. The spreading or reflexed inflorescences (flower clusters) support 5 to 14 pink-purple bilateral flowers that develop crescent shaped fruit pods (Wojciechowski Spellenberg 2012). This species is typically found in rocky, carbonate substrates along washes and slopes within pinyon woodland, pinyon-juniper woodland, Joshua tree woodland, and blackbush scrub habitats on the northern (desert) slopes of the San Bernardino Mountains at elevations between 1,185 and 1,950 meters (3,888 to 6,397 feet). Cushenbury milk-vetch is typically found on soils derived directly from decomposing limestone rock (USFWS 2009a). This species typically blooms from March through June (Calflora 2023).

> *Findings*: According to the CNDDB, the nearest documented Cushenbury milk-vetch occurrence (2021) is approximately 2.4 miles northeast of the BBARWA WWTP site. This occurrence is located along a ridge between Nelson ridge and Arrastre Creek, on soils derived from carbonate and quartz monzonite in open pinyon woodland habitat (CNDDB 2023). There are no documented Cushenbury milk-vetch occurrences in the Big Bear Valley.

The USFWS lists the primary constituent elements (PCEs) for Cushenbury milk-vetch designated Critical Habitat as:

1. soils derived primarily from the upper and middle members of the Bird Spring Formation and Undivided Cambrian parent materials that occur on dry flats and slopes or along rocky washes with limestone outwash/deposits at elevations between 1,171 and 2,013 meters (3,864 and 6,604 feet).

2. soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).

3. associated plant communities that have areas with an open canopy cover and little accumulation of organic material (e.g., leaf litter) on the surface of the soil.

The associated plant communities (PCE 3) and carbonate or limestone substrates (PCE 1) Cushenbury milk-vetch requires do not occur within the proposed Project footprint. Furthermore, most of the proposed Project footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Additionally, the Project Area is outside the known elevation range for this species, which has not been documented in the Big Bear Valley. Therefore, Cushenbury milk-vetch is presumed absent from the proposed Project footprint and the Project will not affect this species.

Ash-gray Paintbrush – Threatened (Federal)

The federally listed as threatened ash-gray paintbrush is a hemiparasitic, perennial herb in the broomrape family (Orobanchaceae), with several ascending to decumbent (trailing) grayish stems sprouting from the root crown. The stems are 1 to 2 decimeters (4 to 8 inches) tall (Munz 1974, p. 795). Ash-gray paintbrush is distinguished from other species of *Castilleja* within its range by its perennial nature, ashy-puberulent (covered with short hairs) stems and leaves, yellowish or reddish flowers, with calyx lobes of equal length (Wetherwax et al. 2012, p. 957). Host plants include *Eriogonum kennedyi* var. *austromontanum*, *Eriogonum kennedyi* var. *kennedyi*, *Eriogonum wrightii* var. *subscaposum*, *Artemisia tridentata* ssp. *tridentata*, *Artemisia nova*, and other *Artemisia* taxa (USFWS 2013a). However, because this species also possesses photosynthetic green leaves that can produce sugars, it is termed hemiparasitic and does not require a host plant species for its survival (USFWS 2013a). This species typically occupies the meadow/forest ecotone (transitional area of vegetation between two different plant communities) of the San Bernardino Mountains at elevations between 1,800 and 3,300 meters (5,905 to 10,827 feet.) and has been recorded in the following ecological communities: pebble plains, dry and wet forest meadows, mixed conifer forests, open pine forests, and pinyon-juniper woodlands (USFWS 2013a). However, the primary habitat for this species is pebble plains, supporting one or more of the host plant species for ash-gray paintbrush (USFWS 2013a). This species typically blooms from June through August (Calflora 2023).

Findings: According to the CNDDB, the nearest documented ash-gray paintbrush occurrences are adjacent the southeast corner of the BBARWA WWTP (1999) and approximately 400 feet north of the Baldwin Lake conveyance pipeline alternative (2016), within big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable habitat for this species within the proposed Project footprint near the western end of the Baldwin Lake conveyance pipeline alternative and potential hostplant species (*Artemisia* spp.) are present in this area as well. However, ash-gray paintbrush was not observed within the proposed Project footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, ash-gray paintbrush is considered absent from the proposed Project footprint at the time of survey and the Project will not affect this species.

Suitable Habitat Locations in Program Area:

- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

Big Bear Valley Sandwort – Threatened (Federal)

The federally listed as threatened Big Bear Valley sandwort is a low, tufted perennial herb in the pink family (Caryophyllaceae). Individual plants are green, with stems from 10 to 18 centimeters (3.9 to 7.1 inches) long. The leaves are opposite and 0.5 to 1 centimeter (0.2 to 0.39 inches) long. The flowers are white, five-petaled, and arranged in open cymes (clusters). The petals are 0.2 to 0.45 centimeters (0.1 to 0.18 inches) long (USFWS 2015a). This species is typically found in pebble plain habitat in the northeastern San Bernardino Mountains of southwest San Bernardino County at elevations between 1,950 and 2,100 meters (6,393 to 6,885 feet.) (USFWS 2015a). Pebble plains are a rare plant community that occur in treeless, open patches within pine forests and pinyon-juniper woodlands that are comprised of clay soil mixed with quartzite pebbles and gravel that are continually pushed to the surface through frost action (USFS 2002, pp. 12, 15). Big Bear Valley sandwort is typically found within pebble plain habitat and is one of three indicator plant species, along with *Eriogonum kennedyi* var. *austromontanum*, and *Ivesia argyrocoma* var. *argyrocoma* defining a pebble plain (USFWS 2015a). This species typically blooms from May through August (Calflora 2023).

Findings: According to the CNDDB, the nearest documented Big Bear Valley sandwort occurrences are approximately 0.3 mile west (2021) and 0.5 mile north (1981) of the proposed Shay Pond conveyance pipeline alignment, within the Sawmill Pebble Plain Complex. However, there is no pebble plain or pebble plain-like habitat suitable for Big Bear Valley sandwort within the proposed Project footprint and this species was not detected during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, Big Bear Valley sandwort is considered absent from the proposed Project footprint at the time of survey and the Project will not affect this species.

Parish's Daisy – Threatened (Federal)

The federally listed as endangered Parish's daisy is a small perennial herb (subshrub) in the aster family (Asteraceae). The vertically oriented stems are few-branched near the mid-stem, silvery-hairy, especially distally, and grow to 10 to 35 centimeters (3.9 13.8 inches) in height (Keil and Nesom 2012). The cauline leaves (sometimes absent by flowering) are linear and silvery-strigose. The composite flowers typically include 30 to 50 pink or white ray flowers (Keil and Nesom 2012). Parish's daisy typically occurs on rocky slopes, active washes, and outwash plains, in pinyon woodland, pinyon-juniper woodland, and blackbush scrub habitats along the northern (desert) slopes of the San Bernardino Mountains and Little San Bernardino Mountains at elevations between 1,050 and 2,245 meters (3,445 to 7,365 feet). This species is typically found on soils derived directly from decomposing limestone or dolomite (USFWS 2009b). Parish's daisy typically blooms from May through August (Calflora 2023).

Findings: According to the CNDDB, the nearest documented Parish's daisy occurrence (1988) is approximately 1.8 miles northeast of the BBARWA WWTP site. This occurrence is located within a drainage along Nelson ridge, on soils derived from dolomite on carbonaceous rock in open pinyon and Joshua tree dominated woodland habitat (CNDDB 2023). There are no documented Parish's daisy occurrences in the Big Bear Valley.

The USFWS lists the primary constituent elements (PCEs) for Parish's daisy designated Critical Habitat as:

1. soils derived primarily from upstream or upslope limestone, dolomite, or quartz monzonite parent materials that occur on dry, rocky hillsides, shallow drainages, or outwash plains at elevations between 1,171 and 1,950 meters (3,842 and 6,400 feet).

2. soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).

3. associated plant communities that have areas with an open canopy cover.

The associated plant communities (PCE 3) and limestone, dolomite, or quartz monzonite substrates (PCE 1) Parish's daisy requires do not occur within the proposed Project footprint. Furthermore, most of the proposed Project footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Additionally, this species has not been documented in the Big Bear Valley. Therefore, Parish's daisy is presumed absent from the proposed Project footprint and the Project will not affect this species.

Southern Mountain Buckwheat – Threatened (Federal)

The federally listed as threatened southern mountain buckwheat is a woody-based, cushion-like, perennial plant in the buckwheat family (Polygonaceae). Individual plants are 8 to 15 centimeters (3.1 to 5.9 inches) tall, with stems forming loose, leafy mats, 14 to 36 centimeters (5.5 to 14.1 inches) wide. The leaves are oblanceolate (broadest above the middle and tapering toward the base) and 0.5 to 1 centimeter (0.2 to 0.4 inches) long, with dense white hair. The inflorescences (flower clusters) are 8 to 15 centimeters (3.2 to 5.9 inches) high, bearing head-like inflorescences. The perianth is white to rose and composed of inner and outer lobes that are similar in appearance (USFWS 2015b). This species is typically found in pebble plain habitat in the northeastern San Bernardino Mountains of southwest San Bernardino County at elevations between 2,000 and 2,200 meters (6,557 to 7,213 feet.) (USFWS 2015b). Southern mountain buckwheat is typically found within pebble plain habitat and is one of three indicator plant species, along with *Eremogone ursina*, and *Ivesia argyrocoma* var. *argyrocoma* defining a pebble plain (USFWS 2015b). This species typically blooms from June through September (Calflora 2023).

Findings: According to the CNDDB, the nearest documented southern mountain buckwheat occurrences are approximately 0.3 mile west (2021) and 0.5 mile north (1981) of the proposed Shay Pond conveyance pipeline alignment, within the Sawmill Pebble Plain Complex. However, there is no pebble plain or pebble plain-like habitat suitable for southern mountain buckwheat within the proposed Project footprint and this species was not detected during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, southern mountain buckwheat is considered absent from the proposed Project footprint at the time of survey and the Project will not affect this species.

Cushenbury Buckwheat – Endangered (Federal)

The federally listed as endangered Cushenbury buckwheat is a low, densely matted perennial in the buckwheat family (Polygonaceae) that reaches approximately 10 centimeters (4 inches) in height and forms a mat up to 51 centimeters (20 inches) in diameter (USFWS 2009c). This species is typically found within pinyon woodland, pinyon-juniper woodland, Joshua tree woodland, and blackbush scrub habitats on limestone or other carbonate soils at elevations between 1,400 and 2,400 meters (4,600 and 7,900 feet) in the San Bernardino Mountains (USFWS 2009c). This species typically blooms from May to August (Calflora 2023).

Findings: According to the CNDDB, the nearest documented Cushenbury buckwheat occurrence (2021) is approximately 0.5 mile northwest of the Stanfield Marsh conveyance pipeline discharge outlet (Option 1) site, north of Stanfield Marsh, on limestone marble and dolomitic limestone soils (CNDDB 2023).

The USFWS lists the primary constituent elements (PCEs) for Cushenbury buckwheat designated Critical Habitat as:

1. Soils derived primarily from the upper and middle members of the Bird Spring Formation and Bonanza King Formation parent materials that occur on hillsides at elevations between 4,600 to 7,900 feet (1,400 to 2,400 meters).

2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).

3. Associated plant communities that have areas with an open canopy cover (generally less than 15 % cover) and little accumulation of organic material (e.g., leaf litter) on the surface of the soil (USFWS 1994).

The associated plant communities (PCE 3) and carbonate or limestone substrates (PCE 1) Cushenbury buckwheat requires do not occur within the proposed Project footprint. Furthermore, most of the proposed Project footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Therefore, Cushenbury buckwheat is presumed absent from the proposed Project footprint and the Project will not affect this species.

San Bernardino Mountains bladderpod – Endangered (Federal)

The federally listed as endangered San Bernardino Mountains bladderpod is a silvery, short-lived perennial in the mustard family (Brassicaceae), that reaches approximately 5 to 15 centimeters (2 to 6 inches) in height (USFWS 2009d). The outer basal leaves are diamond-shaped to round, and the inner leaves are elliptic with petioles 2 to 5 centimeters (0.8 to 2 inches) long. The flower petals are yellow, and the fruits are spherical, pubescent, two-chambered, and contain 2 to 4 seeds per chamber (USFWS 2009d). This species is typically found within single leaf pinyon-mountain juniper and white fir forest on limestone and dolomite soils and gentle to moderate slopes at elevations between 2,098 and 2,700 meters (6,883 and 8,800 feet) in the San Bernardino Mountains (USFWS 2009d). This species typically blooms from May to June (Calflora 2023).

Findings: According to the CNDDB, the nearest documented San Bernardino Mountains bladderpod occurrence (2019) is approximately 1,000 feet north of the Stanfield Marsh conveyance pipeline discharge outlet (Option 1) site. This occurrence is located in mixed single leaf pinyon, mountain juniper, and white fir forest habitat, on several carbonate hills situated just north of Big Bear Lake and Stanfield Marsh (CNDDB 2023).

The USFWS lists the primary constituent elements (PCEs) for San Bernardino Mountains bladderpod designated Critical Habitat as:

1. Soils derived primarily from Bonanza King Formation and Undivided Cambrian parent materials that occur on hillsides or on large rock outcrops at elevations between 6,883 and 8,800 feet (2,098 and 2,700 meters).

2. Soils with intact, natural surfaces that have not been substantially altered by land use activities (e.g., graded, excavated, re-contoured, or otherwise altered by ground-disturbing equipment).

3. Associated plant communities that have areas with an open canopy cover and little accumulation of organic material (e.g., leaf litter) on the surface of the soil (USFWS 1994).

The associated plant communities (PCE 3) and limestone or dolomite soils (PCE 1) San Bernardino Mountains bladderpod requires do not occur within the proposed Project footprint. Furthermore, most of the proposed Project footprint has been previously disturbed and the soils on site are no longer intact, natural surfaces (PCE 2). Therefore, San Bernardino Mountains bladderpod is presumed absent from the proposed Project footprint and the Project will not affect this species.

San Bernardino Blue Grass – Endangered (Federal)

The federally listed as endangered San Bernardino blue grass is a rhizomatous, tufted, perennial herb in the grass family (Poaceae) that grows to approximately 10 to 55 centimeters (1.2 to 2.8 inches) tall. This species is dioecious and the unisexual flower inflorescences (flower clusters) are 3 to 7 centimeters (3.2 to 5.9 inches) long, with smooth, appressed branches and glabrous spikelets (Soreng 2012). San Bernardino blue grass occurs only in montane meadows at altitudes from 1,800 to 2,300 meters (5906 to 7546 feet) in San Bernardino and San Diego Counties (USFWS 2008). This species typically blooms from May through September (Calflora 2023).

Findings: San Bernardino blue grass has been documented within the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. According to the CNDDB, the next nearest documented San Bernardino blue grass occurrences (1981) are immediately adjacent the Shay Pond conveyance pipeline alignment and immediately adjacent the Stanfield Marsh conveyance pipeline discharge outlet (Option 2) site, respectively. There is also suitable montane meadow habitat for this species within the Baldwin Lake conveyance pipeline alternative, as well as the solar evaporation ponds components of the proposed Project. However, San Bernardino blue grass was not observed within the proposed Project footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, San Bernardino blue grass is considered absent from the proposed Project footprint at the time of survey and the Project, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond conveyance pipeline be required, additional surveys would be necessary prior to implementation of Project activities, to assess potential Project related impacts to San Bernardino blue grass and other special status species that may occur in this area.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Shay Pond Conveyance Pipeline Alignment
- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

Bird-foot Checkerbloom – Endangered (Federal/State)

The state and federally listed as endangered bird-foot checkerbloom is a perennial herb in the mallow family (Malvaceae), with erect stems that grow to approximately 20 to 40 centimeters (7 to 16 inches) from a fleshy, nonrhizomatous taproot. This species is gynodioecious, with up to 25-centimeter-long, spike-like inflorescences that produce either bisexual or pistillate flowers that are rose-pink to magenta in color with dark veins (Hill 2012). The basal, cauline leaves are ternate-dissected, palmately five to seven parted into narrow, three lobe divisions, which are further dissected into linear to oblong segments (USFWS 2011a). Bird-foot checkerbloom

occurs only in vernally moist meadows and sparsely vegetated, drier meadow sites at elevations from 1,600 to 2,500 meters (5,250 to 8,200 feet) in the Big Bear Valley of the San Bernardino Mountains in San Bernardino County (USFWS 2011a). This species typically blooms from May through August (Calflora 2023).

Findings: Bird-foot checkerbloom was observed within and adjacent the proposed Project footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Approximately 100+ individual bird-foot checkerbloom were observed within and adjacent the Baldwin Lake conveyance pipeline alternative alignment and the proposed evaporation ponds footprint at the BBARWA WWTP (Figure 11, Page 43). According to the CNDDB, bird-foot checkerbloom was also documented within the proposed Baldwin Lake conveyance pipeline alternative alignment in 2019, near the west end of the alignment, as well as near the southeast corner of the BBARWA WWTP (2009). There is also suitable montane meadow habitat for this species within the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline, as well as immediately adjacent the Shay Pond conveyance pipeline alignment and Stanfield Marsh conveyance pipeline discharge outlet components of the proposed Project. Given that bird-foot checkerbloom is present within the proposed Project footprint, the Project may affect this species and construction of the Baldwin Lake conveyance pipeline alternative and proposed evaporation ponds, as currently described, is likely to adversely affect this species.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Shay Pond Conveyance Pipeline Alignment
- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

Replenish Big Bear Project

California Dandelion – Endangered (Federal)

The federally listed as endangered California dandelion is a perennial herb in the aster family (Asteraceae) with 10 to 20 basal, oblanceolate, generally toothed, or occasionally shallowly lobed leaves, that grows to approximately 5 to 20 centimeters (2 to 8 inches) tall. This species produces yellow composite flowers with erect outer phyllaries that are lance-ovate to widely ovate with hornless tips and rounded, generally hornless main phyllaries (Brouillet 2012). California dandelion can be distinguished from the sympatric, nonnative, common dandelion (*Taraxacum officinale*) by the sharply cut or recurved-lobed leaves and reflexed outer phyllaries observed in the flowering plant of the latter species (USFWS 2013b). California dandelion occurs only in the relatively open edges or margins of moist meadow habitats at altitudes from 2,000 to 2,800 meters (6,700 to 9,000 feet) in the San Bernardino Mountains in San Bernardino County (USFWS 2013b). This species typically blooms from May through August (Calflora 2023).

Findings: California dandelion has been documented within the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. According to the CNDDB, the next nearest documented California dandelion occurrences are immediately adjacent the southeast corner of the BBARWA WWTP site (2000) and approximately 1,000 feet north of the Baldwin Lake conveyance pipeline alternative alignment (2008), near the west end of the alignment, respectively. There is suitable montane meadow habitat for this species within the Baldwin Lake conveyance pipeline alternative, as well as the proposed solar evaporation ponds, immediately adjacent the Shay Pond conveyance pipeline alignment, and adjacent the Stanfield Marsh conveyance pipeline discharge outlet components of the proposed Project. However, California dandelion was not observed within the proposed Project footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, California dandelion is considered absent from the proposed Project footprint at the time of survey and the Project, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond conveyance pipeline be required, additional surveys would be necessary prior to implementation of Project activities, to assess potential Project related impacts to California dandelion and other special status species that may occur in this area.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Shay Pond Conveyance Pipeline Alignment
- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

Slender-petaled Thelypodium – Endangered (Federal)

The state and federally listed as endangered slender-petaled thelypodium is a glabrous (lacks hairs), biennial herb in the mustard family (Brassicaceae) with a rosette of wavy basal leaves and 30 to 90 centimeter (11.8 to 35.4 inch) tall, simple, or branched distally stems, which have mid-cauline sessile, sagittate to clasping, entire leaves. This species has small lavender or white flowers with narrow (0.3 to 0.5 millimeter wide) linear petals that are crinkled between the blade and claw (Al-Shehbaz 2012). Slender-petaled thelypodium produces narrow, linear fruits that are 3 to 5 centimeters (1.2 to 2 inches) long (USFWS 2011b). This species occurs on vernally moist alkaline meadows, alkaline flats, and lakeshores at altitudes from 1,600 to 2,500 meters (5,250 to 8,200 feet) in the Big Bear Valley of the San Bernardino Mountains in San Bernardino County (USFWS 2011b). All known populations of slender-petaled thelypodium are found on alkaline clay soils crossed by annually moist

seeps and streams, indicating that soil hydrology is an important factor in determining distribution (USFWS 2011b). This species is found towards the drier edges of moist meadows, or drier sparsely vegetated meadows, often growing up through sagebrush shrubs (USFWS 2011b). This species typically blooms from May through September (Calflora 2023).

Findings: Slender-petaled thelypodium has been documented within the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. According to the CNDDB, the next nearest documented slender-petaled thelypodium occurrence is immediately adjacent (to the north) the Baldwin Lake conveyance pipeline alternative (2019), within montane meadow and big sagebrush habitat near the western end of this proposed alignment alternative (West Baldwin Lake Trail). There is suitable montane meadow and big sagebrush habitat for this species within the Baldwin Lake conveyance pipeline alternative, as well as adjacent the Shay Pond conveyance pipeline components of the proposed Project. However, slender-petaled thelypodium was not observed within the proposed Project footprint during the floristic botanical field surveys conducted by Jacobs in June-July of 2022 and July of 2023. Therefore, slender-petaled thelypodium is considered absent from the proposed Project footprint at the time of survey and the Project, as currently described, will not affect this species. Should replacement of the existing pipeline to the new Shay Pond conveyance pipeline be required, additional surveys would be necessary prior to implementation of Project activities, to assess potential Project related impacts to slender-petaled thelypodium and other special status species that may occur in this area.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Shay Pond Conveyance Pipeline Alignment
- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

3.2.1.2 Special Status Animals

Unarmored Threespine Stickleback – Endangered (Federal/State)

The state and federally listed as endangered UTS is a small (up to 6 centimeters [2.4 inches]) freshwater fish in the stickleback family (Gasterosteidae) that is distinguished from the other two threespine stickleback subspecies primarily in that it lacks any protective lateral plates (modified scales). UTS typically inhabit slow-moving streams or quiet-water microhabitats in swifter streams and rivers (USFWS 2009e). This species feeds on aquatic invertebrates and prefers aquatic refugia consisting of dense and abundant vegetation, algal mats, or barriers to swift water such as sand bars, floating vegetation, or low-flow road crossings. Although UTS reproduce year-round, breeding activity usually slows from October to January, and this species likely only lives for about 1 year (USFWS 2009e).

Historically, UTS occurred in many watersheds throughout southern California, including the headwaters of the Santa Clara River and low gradient parts of the Los Angeles River, San Gabriel River, and Santa Ana River in the Los Angeles Basin, the Santa Maria River drainage in San Luis Obispo County, and San Antonio Creek in Santa Barbara County (USFWS 2021). In 1970, the UTS was listed as endangered under the Endangered Species Preservation Act of 1966 as a result of population declines due to urbanization, eutrophication, stream channelization, water releases, groundwater removal, declining water quality, nonnative predators, disease, introgression, competition, and stochastic extinction. In the San Bernardino Mountains, UTS is currently considered extant at only three sites: Sugarloaf Meadow Pond, Juniper Springs Pond, the vicinity of Shay Creek

(USFWS 2021). The Shay Creek population at Shay Pond persists due to BBCCSD discharges of approximately 50 AFY of supplemental water into Shay Pond to prevent desiccation. The status of the remaining UTS population from the vicinity of Shay Creek, including those in Motorcycle Pond, Shay Creek, Weibe's Pond, and Baldwin Lake are considered intermittent or unknown (i.e., Weibe's Pond), primarily due to the ephemeral hydrologic regime within the Shay Creek system (USFWS 2021).

Findings: UTS have been documented within the Shay Creek system from Baldwin Lake at the downstream terminus of Shay Creek, to Shay Pond and Motorcycle Pond at the upstream extent of Shay Creek. The possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline extends through Shay Meadow, in the immediate vicinity of Shay Creek. Should replacement of the existing pipeline to the new Shay Pond conveyance pipeline be required, the Project could potentially result in adverse effects to UTS that intermittently inhabit this portion of Shay Creek. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline.

The goal of the Shay Pond conveyance pipeline and associated discharge outlet component of the proposed Project is to provide a more sustainable water source needed to maintain and enhance suitable UTS habitat conditions in Shay Pond. The Project would increase the amount of water supplied to Shay Pond from the current 50 ACY to an anticipated 80 ACY. The proposed Shay Pond conveyance pipeline would be constructed in an existing unpaved roadway and the discharge outlet would be constructed in an upland area immediately adjacent Shay Pond. Therefore, construction activities associated with the installation of the proposed conveyance pipeline and discharge outlet will not affect this species. The Project may affect UTS by causing a temporary change in water level and/or flow rate within Shay Pond, due to the increased discharge. However, the increased discharge would have a beneficial effect on UTS and UTS habitat at Shay Pond. Therefore, the Project may affect, but would not adversely affect this species.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Shay Pond Conveyance Pipeline Alignment

Quino Checkerspot Butterfly – Endangered (Federal)

The federally listed as endangered quino checkerspot butterfly is a butterfly in the checkerspot subfamily (Melitaeinae) of the brushfooted butterfly family (Nymphalidae) that occurs in Riverside and San Diego Counties and the northern areas of Baja California Norte, Mexico. This species occurs in patchy scrubland habitats characterized by mosaics of open areas and dense patches of shrubs (USFWS 2003). Host plants required by quino checkerspot larvae for food sources include *Plantago erecta*, *Plantago patagonica*, *Anterrhinum coulterianum,* and *Collinsia concolor* (USFWS 2003). Although quino checkerspot butterfly historically ranged throughout much of non-montane southern California, this species has been extirpated from more than 75 % of its former range (USFWS 2003). Due to dramatic declines resulting primarily from habitat loss, degradation, and fragmentation, the USFWS listed the quino checkerspot butterfly as endangered on January 16, 1997, and the USFWS issued an incidental take permit for this species to the Riverside County Habitat Conservation Agency under the MSHCP on June 22, 2004.

Findings: Although there is a single quino checkerspot butterfly historic collection (1969) from approximately 2.7 miles south/southeast of the Shay Pond conveyance pipeline Project component, the identity of this specimen is questionable (CNDDB 2023). Furthermore, there are no other occurrences of this species documented in the Big Bear Valley and this species is considered extirpated in San

Bernardino County. Therefore, quino checkerspot butterfly is not likely to occur in the Project Area and the Project will not affect this species.

Bald Eagle – Delisted (Federal) / Endangered (State)

The bald eagle (BAEA) was a federally listed species until 2007 when it was delisted because of the increase in population. However, it remains a state listed endangered species and is covered under the federal Migratory Bird Treaty Act (MBTA) of 1918, as well as the Bald and Golden Eagle Protection Act of 1940, as amended in 1962. BAEA are distinguished by a white head and white tail feathers, are powerful, brown birds that may weigh 14 pounds and have a wingspan of 8 feet. Male eagles are smaller, weighing as much as 10 pounds and have a wingspan of 6 feet. Sometimes confused with Golden Eagles, BAEA are mostly dark brown until they are four to five years old and acquire their characteristic coloring. They live near rivers, lakes, and marshes where they can find fish, their staple food. BAEA will also feed on waterfowl, turtles, rabbits, snakes, and other small animals and carrion. BAEA require a good food base, perching areas, and nesting sites. Their habitat includes estuaries, large lakes, reservoirs, rivers, and some seacoasts (CDFW 2016). In winter, the birds congregate near open water in tall trees for spotting prey and night roosts for sheltering (CDFW 1999). They mate for life, choosing the tops of large trees to build nests, which they typically use and enlarge each year. In most of California, the breeding season lasts from about January through July or August (CDFW 2016). Nests may reach 10 feet across and weigh a half ton. They may also have one or more alternate nests within their breeding territory (CDFW 2016). The young eagles are flying within three months and are on their own about a month later.

Perches in the immediate vicinity of lakeshores form an essential habitat requirement for BAEA in the Big Bear Valley and the major threat to the continued existence of wintering BAEA in this area comes from development and modification of habitat near the shoreline (Walter and Garrett 1981).

Findings: The Forest Service conducts annual surveys for BAEA in the San Bernardino Mountains. Migrating BAEA have long been documented to overwinter at Big Bear Lake and Baldwin Lake. During a two-year study of the wintering BAEA population in the Big Bear Valley, it was estimated that about 30 individuals wintered in the Big Bear Valley. The wintering period for migrating BAEA in the Big Bear Valley area is generally December through March, with the first eagles arriving in mid-November and the last eagles leaving in early April (Walter and Garrett 1981). The highest numbers of wintering eagles in the area are in January and early February (Walter and Garrett 1981).

Since 2012, at least one resident pair has been documented in the Big Bear Valley, which first nested successfully in 2012 and 2015. These eagles typically nest to the west of Grout Bay in the Fawnskin area, approximately 5 miles west of the Stanfield Marsh conveyance pipeline discharge outlet locations.

Big Bear and Baldwin Lakes support overwintering migratory BAEA and the BBARWA WWTP site is within suitable BAEA foraging habitat and adjacent BAEA for perching habitat along the Baldwin Lake shoreline. However, this species is not known to nest in the Project Area and given the existing human disturbance adjacent the Project site, consisting mostly of residential development, BBARWA WWTP operations and maintenance, and Big Bear City Airport operations and maintenance, BAEA are not likely to nest within the Project Area. Furthermore, the proposed evaporation ponds and Baldwin Lake conveyance pipeline alternative would be constructed when those portions of Baldwin Lake are dry, and potential BAEA prey (i.e., fish, waterfowl.) are absent from the Project Area. Although BAEA may utilize lakeshore perches when Stanfield Marsh and Baldwin Lake are dry, the Project will not remove any of these trees and the only potential Project-related impacts to overwintering eagles would be if the construction disturbance alters their utilization of lakeshore perches for foraging on fish and waterfowl, which would not be the case when the lake are dry. Therefore, potential Project related effects due to construction disturbance

would likely be insignificant and although the Project may affect BAEA, it will not adversely affect this species.

Suitable Habitat Locations in Program Area:

- Stanfield Marsh Conveyance Pipeline Discharge Outlets
- BBARWA WWTP Upgrades
- Baldwin Lake Conveyance Pipeline Alternative

Southern Rubber Boa – Threatened (State)

The state listed as threatened southern rubber boa (rubber boa) is a small, rather stout-bodied snake with smooth scales and a blunt head and tail (Stewart et al. 2005). Adults grow to about 49.5-55.9 centimeters (19.5-22 inches) in length. Adult rubber boas are light brown or tan in dorsal color with an unmarked yellow venter; juveniles are pale without a distinct margin between dorsal and ventral coloration (Stewart et al. 2005). Rubber boas are primarily fossorial and are rarely encountered on the surface, except on days and nights of high humidity and overcast sky. During warm months, this snake is typically active at night and on overcast days. Rubber boas hibernate during the winter, usually in crevices in rocky outcrops. Other potential hibernacula for this species may include rotting stumps.

Typical southern rubber boa habitat is mixed conifer-oak forest or woodland dominated by two or more of the following species: Jeffrey pine (*Pinus jeffreyi*), yellow pine (*P. ponderosa*), sugar pine (*P. lambertiana*), incense cedar (*Calocedrus decurrens*), white fir (*Abies concolor*), and black oak (*Quercus kelloggii*) (Stewart et al., 2005). Rubber boas are usually found near streams or wet meadows or within or under surface objects with good moisture retaining properties such as rotting logs (CDFW 2014). Much of the literature suggests that the rubber boa prefers moist conifer-oak forests and woodlands between 5,000 and 8,000 feet in elevation, especially in canyons and on cool, north facing slopes (CDFW 1987). However, the factors of overriding importance seem to be access to hibernation sites below the frost line and access to damp soil (Keasler 1982). In all habitat types, rock outcrops and surface materials (i.e., rocks, logs, and a well-developed duff layer) are important habitat components because they provide cover and maintain soil moisture (Loe 1985, as cited in Stewart et al. 2005).

Findings: According to the CNDDB, the nearest documented rubber boa occurrence (2013) is approximately 0.5 mile north of the west end of the western end of the Baldwin Lake conveyance pipeline alternative, on the north side of East North Shore Drive (State Route 18 [SR 18]) (CDFW pers. comm.). There is some marginally suitable rubber boa habitat in the vicinity of the Baldwin Lake conveyance pipeline alternative consisting of mixed wet montane meadow and big sagebrush habitat, with scattered trees, large shrubs, and woody debris. Additionally, the Baldwin Lake conveyance pipeline alternative crosses an ephemeral stream (Caribou Creek) near the western end of the alignment. However, the mixed conifer-oak forest or woodland habitats that rubber boa typically occur in are absent from this area and there are no nearby rock outcrops, downed logs, or tree stumps that could provide potential rubber boa hibernacula.

There is suitable rubber boa habitat in the vicinity of the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline. Additionally, although the Sand Canyon discharge outlet and portions of the Sand Canyon conveyance pipeline are adjacent undeveloped areas of potentially suitable rubber boa habitat consisting of mixed Jeffrey pine forest and woodland and mountain juniper woodland habitats, there is no suitable rubber boa habitat within the proposed footprint of these Project components.

Due to the environmental conditions and existing disturbances within and adjacent the proposed Project footprint, as currently described, rubber boa is very unlikely to occur within the proposed Project footprint. Therefore, the proposed Project may affect, but is not likely to adversely affect this species.

Suitable Habitat Locations in Program Area:

- Possible Replacement Pipeline Alignment from the BBARWA WWTP
- Sand Canyon Conveyance Pipeline
- Sand Canyon Discharge Outlet

California Spotted Owl – SSC

The California spotted owl (SPOW) is considered an SSC by the CDFW and is listed as a Sensitive Species by the U.S. Forest Service. The SPOW breeds and roosts in forests and woodlands with large old trees and snags, high basal areas of trees and snags, dense canopies (≥70% canopy closure), multiple canopy layers, and downed woody debris (Verner et al. 1992a, as cited in Davis and Gould 2008). Large, old trees are the key component; they provide nest sites and cover from inclement weather and add structure to the forest canopy and woody debris to the forest floor. These characteristics typify old-growth or late-seral-stage habitats (Davis and Gould 2008). Because the SPOW selects stands that have higher structural diversity and significantly more large trees than those generally available, it is considered a habitat specialist (Moen and Gutiérrez 1997, as cited in Davis and Gould 2008). In southern California, SPOW principally occupy montane hardwood and montane hardwood-conifer forests, especially those with canyon live oak (*Quercus chrysolepis*) and bigcone Douglas-fir (*Pseudotsuga macrocarpa*), at mid to high elevations (Davis and Gould 2008).

SPOW prey on small mammals, particularly dusky-footed woodrats (*Neotoma fuscipes*) at lower elevations (oak woodlands and riparian forests) and throughout southern California (Verner et al. 1992a, as cited in Davis and Gould 2008). The SPOW breeding season occurs from early spring to late summer or fall. Breeding spotted owls begin pre-laying behaviors, such as preening and roosting together, in February or March and juvenile owl dispersal likely occurs in September and October (Meyer 2007). The SPOW does not build its own nest but depends on finding suitable, naturally occurring sites in tree cavities or on broken-topped trees or snags, on abandoned raptor or common raven (*Corvus corax*) nests, squirrel nests, dwarf mistletoe (*Arceuthobium* spp.) brooms, or debris accumulations in trees (Davis and Gould 2008). In the San Bernardino Mountains, platform nests predominate (59%) and were in trees with an average diameter at breast height (dbh) of 75 cm, whereas cavity nest trees and broken-top nest trees were significantly larger (mean dbh of 108.3 cm and 122.3 cm, respectively) (LaHaye et al. 1997, as cited in Davis and Gould 2008).

According to LaHaye and Gutierrez (2005), urbanization in the form of primary and vacation homes has degraded or consumed some forest in most mountain ranges. The results of spotted owl surveys conducted between 1987 and 1998 in the San Bernardino Mountains indicated that a large area of potentially suitable spotted owl habitat, enough to support 10-15 pairs, existed between Running Springs and Crestline (LaHaye and others 1999, as cited in LaHaye and Gutierrez 2005). However, only four pairs have been found in this area, and owls were found only in undeveloped sites. Thus, residential development within montane forests may preclude spotted owl occupancy, even when closed-canopy forest remains on developed sites (LaHaye and Gutierrez 2005).

Findings: According to the CNDDB Spotted Owl Observations Database (2023), the nearest documented SPOW observation is a SPOW activity center (e.g., a roosting or nesting site) located approximately 1 mile southeast of the Sand Canyon conveyance pipeline alignment. However, the Project Area is within an existing urban and rural residential setting that is subject to a high level of human disturbance. Additionally, the Project Area does not support the old growth montane hardwood and montane

hardwood-conifer forests that SPOW typically occupy in the region. Therefore, SPOW are not likely to occur in the Project Area and the Project will not affect this species.

San Bernardino Flying Squirrel – SSC

The San Bernardino flying squirrel (flying squirrel) is considered an SSC by the CDFW and is listed as a Sensitive Species by the U.S. Forest Service. The flying squirrel is a nocturnally active, arboreal squirrel that is distinguished by the furred membranes extending from wrist to ankle that allow squirrels to glide through the air between trees at distances up to 91 meters (300 feet) (Wolf 2010). The San Bernardino flying squirrel is the most southerly distributed subspecies of northern flying squirrel (*Glaucomys sabrinus*) and is paler in color and smaller than most other northern flying squirrel subspecies. It inhabits high-elevation mixed conifer forests comprised of white fir, Jeffrey pine, and black oak between ~4,000 to 8,500 feet. It has specific habitat requirements that include associations with mature forests, large trees, and snags, closed canopy, downed woody debris, and riparian areas, and it is sensitive to habitat fragmentation. It specializes in eating truffles (e.g. hypogeous mycorrhizal sporocarps) buried in the forest floor as well as arboreal lichens in winter when truffles are covered with snow and unavailable (Wolf 2010). This flying squirrel historically occurred as three isolated populations in the San Gabriel, San Bernardino, and San Jacinto Mountain forests.

Flying squirrel populations are adversely affected by habitat fragmentation. Rosenberg and Raphael (1984) found that in northwestern California, the abundance of squirrels increased with stand size, they were generally absent in stands smaller than 20 hectares (ha), and approximately 75% of stands over 100 ha had flying squirrels. An additional problem with fragmented habitats is the constraints that open spaces pose to the movements of individuals and the colonization of unoccupied habitat patches. Mowrey and Zasada (1982) reported an average gliding distance of about 20 meters in *sabrinus*, with a maximum of 48 meters, and concluded that movements are unimpeded in areas with average openings of 20 meters and occasional openings of 30 to 40 meters (Bolster 1998).

Findings: The Flying Squirrels of Southern California is a project of the San Diego Natural History Museum (SDNHM), in collaboration with the U.S. Forest Service and the USFWS, to try to determine the distribution and habitat use of the flying squirrel in southern California. According to the SDNHM database, flying squirrel have been documented in the vicinity of the Sand Canyon conveyance pipeline alignment, as well as north of West North Shore Drive (State Route 38 [SR 38]), approximately 0.4 mile north of the Meadow Lane conveyance pipeline alternative alignment. Although the Project Area is situated in an urban and rural residential setting that is subject to a high level of existing human disturbance, this species has been documented in residential areas in the Big Bear Valley and elsewhere. Thus, there is a moderate potential for flying squirrel to occur in the Project Area and species-specific impacts avoidance and minimization measures are recommended.

Suitable Habitat Locations in Program Area:

- Sand Canyon Conveyance Pipeline
- Sand Canyon Discharge Outlet
- East Neighborhoods Conveyance Pipeline Alternative
- West Neighborhoods Conveyance Pipeline Alternative
- North Airport Corridor Conveyance Pipeline Alternative
- Meadow Lane Conveyance Pipeline Alternative

3.2.2 Special Status Habitats

Several special status habitats have been documented in the Project vicinity (within approximately 3 miles) including pebble plains, southern California threespine stickleback stream, and USFWS designated Critical Habitat for several federally listed threatened or endangered species. There is no pebble plain or pebble plain-like habitat within the proposed Project footprint. There is southern California threespine stickleback stream habitat within the Shay Pond conveyance pipeline alignment and possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline and the proposed footprint of the Shay Pond conveyance pipeline is entirely within existing unpaved roadway and upland. Additionally, the Project would increase the amount of water supplied to Shay Pond from the current 50 ACY to an anticipated 80 ACY, which would likely enhance UTS habitat conditions in Shay Pond and potentially, the downstream portion of Shay Creek. Therefore, the Project would not result in any loss or adverse modification pebble plains or southern California threespine stickleback stream.

The nearest USFWS designated Critical Habitat units are adjacent the east side of the BBARWA WWTP and adjacent the north side of the proposed Baldwin Lake conveyance pipeline alternative alignment, respectively. The Critical Habitat unit adjacent the east side of the BBARWA WWTP site consists of the North Shay Meadow USFWS designated Critical Habitat unit (Unit 6) for the federally listed as endangered California dandelion. The Critical Habitat unit adjacent the north side of the proposed Baldwin Lake conveyance pipeline alternative consists of the Pan Hot Springs Meadow USFWS designated Critical Habitat unit (Unit 1) for the federally listed as endangered San Bernardino blue grass and California dandelion. However, no portion of the proposed Project footprint is within these Critical Habitat units, or any other Critical Habitat. Therefore, the Project will not result in the loss or adverse modification of USFWS designated Critical Habitat.

3.3 Jurisdictional Waters Assessment

The Project Area is within the Bear Valley and Baldwin Hydrologic Sub-Areas (HSA 801.71 and 801.73). The Bear Valley HSA comprises a 34,333-acre drainage area, within the larger Santa Ana Watershed (HUC 18070203). The Baldwin HSA comprises a 22,789-acre drainage, also within the Santa Ana Watershed. This watershed is primarily within San Bernardino County and includes portions of Riverside and Orange Counties with a small portion of Los Angeles County. The Santa Ana Watershed is bound on the north by the Mojave and Southern Mojave Watersheds, on the southeast by the Whitewater River and San Jacinto Watersheds, and on the west by the San Gabriel, Seal Beach, Newport Bay, and Aliso-San Onofre Watersheds. The Santa Ana Watershed encompasses a portion of the San Gabriel and San Bernardino Mountains in the north and is approximately 3,000 square miles in area. The Santa Ana River is the major hydrogeomorphic feature within the Santa Ana Watershed. One of several tributaries to the Santa Ana River is Bear Creek, which outflows from Big Bear Lake from the Bear Valley Dam located at the westernmost (downstream) end of Big Bear Lake. Big Bear Lake is one of the head waters of the Santa Ana River Watershed.

Waters of the U.S.

The USACE has authority to permit the discharge of dredged or fill material in WOTUS under Section 404 of the CWA. The Environmental Protection Agency (EPA) and USACE currently define WOTUS as:

1. Waters used either currently, previously, or susceptible to future use in interstate or foreign commerce, the territorial seas, and interstate waters.

2. Impoundments of waters otherwise defined as WOTUS, except for impoundments of those WOTUS that are identified in 5 (below).

3. Relatively permanent, standing, or continuously flowing tributaries to the WOTUS described in 1 and 2 (above).

4. Wetlands that are adjacent to waters described in 1 (above), or relatively permanent, standing or continuously flowing bodies of water identified in 2 or 3 (above) that have a continuous surface connection with those waters.

5. Intrastate lakes and ponds not identified in 1 through 4 (above) that are relatively permanent, standing, or continuously flowing bodies of water with a continuous surface connection to the waters identified in 1 or 3 (above).

Findings: Given that the Santa Ana River is a relatively permanent tributary to the Pacific Ocean (a territorial sea) and Big Bear Lake has a continuous surface connection to the Santa Ana River via Bear Creek, it is likely that the EPA and USACE would consider Stanfield Marsh a wetland WOTUS. Therefore, the Stanfield Marsh discharge outlet component of the Project may result in temporary and/or permanent impacts to jurisdictional waters subject to regulation by the USACE and RWQCB under Sections 404/401 of the CWA, respectively.

State Lake/Streambed

Under Sections 1600 through 1607 of the California FGC, the CDFW has jurisdiction over lakes, rivers, streams, or other aquatic resources, stream-dependent wildlife resources, and riparian habitats. This jurisdiction can include, but is not limited to intermittent and ephemeral streams, rivers, creeks, dry washes, sloughs, USGS blue-line streams, watercourses with subsurface flows, canals, aqueducts, irrigation ditches, and other means of water conveyance that support aquatic life, riparian vegetation, or stream-dependent terrestrial wildlife (CDFG 1994).

Findings: Several aquatic features and habitats were identified in the Project Area that would likely be subject to regulation by the CDFW under Section 1602 of the FGC, as well as by the RWQCB under the Porter-Cologne Water Quality Control Act. Table 3 (below) provides a list of the aquatic features and habitats that were identified in the Project Area, as well as the Project component(s) that may impact those "waters of the State."

Table 3. Potential Impacts to Waters of the State

Waters of the State	Project Component
Stanfield Marsh	Conveyance Pipeline Discharge Outlet
Baldwin Lake	Baldwin Lake Conveyance Pipeline Alternative; BBARWA WWTP Evaporation Ponds
Caribou Creek	Baldwin Lake Conveyance Pipeline Alternative
Shay Pond/Shay Creek	Shay Pond Discharge Outlet; Possible Replacement Pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline (not expected)
Sand Canyon Channel	Sand Canyon Discharge Outlet

Given that the Project is likely to result in temporary and/or permanent impacts to waters of the State, it is likely that FGC Section 1602 and/or RWQCB Waste Discharge Requirements (WDRs) permitting will be required.

4. Effects Analysis

The proposed Project may affect several state and/or federally listed species known to occur in the Project vicinity. Construction of the Baldwin Lake conveyance pipeline alternative and proposed new evaporation ponds at the BBARWA WWTP may affect and is likely to adversely affect the state and federally listed as endangered bird-foot checkerbloom. Potential Project related effects on the state and federally listed as endangered UTS may result due temporary changes in water level and/or flow rate. However, the Project is expected to have a beneficial effect on this species. Therefore, the Project may affect, but is not likely to adversely affect UTS. Any Project related effects on the state listed as endangered BAEA resulting from the construction of the proposed Baldwin Lake conveyance pipeline alternative and proposed new evaporation ponds at the BBARWA WWTP would likely be insignificant. Therefore, the Project may affect, but is not likely to adversely affect BAEA. Likewise, Project related effects on the state listed as threatened rubber boa resulting from the Baldwin Lake conveyance pipeline and Sand Canyon recharge Project components are unlikely to occur. Therefore, the Project may affect, but is not likely to adversely affect rubber boa.

The proposed Project will not affect USFWS designated Critical Habitat. Furthermore, the proposed Project will not affect any resources protected under the Coastal Barriers Resources Act, Coastal Zone Management Act, Fish and Wildlife Conservation Act, Magnuson-Stevens Fishery Conservation and Management Act, the Protection of Wetlands – Executive Order 11990 or Wild and Scenic Rivers Act, respectively.

The proposed Project may impact state and/or federal jurisdictional waters potentially subject to regulation by the USACE under Section 404 of the CWA, the RWQCB under Section 401 of the CWA and Porter-Cologne Water Quality Control Act, or CDFW under Section 1602 of the California FGC, respectively. Figures 12a-12e on Pages 53-57 show the jurisdictional waters identified within the Project Area and their approximate extent in relation to the Project components that may affect them. Stanfield Marsh would likely be considered both a WOTUS and water of the State and any impacts to this jurisdictional water feature resulting from the construction of the Stanfield Marsh discharge outlet would likely require both CWA Section 404/401 and FGC Section 1602 permitting (Figure 12a, Page 53). Although not considered WOTUS, Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel are all waters of the State of California (Figures 12b-12e, Pages 54-57). Therefore, potential Project related impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as CDFW issued Lake or Streambed Alteration Agreements (LSAs).

Migratory Bird Treaty Act

There is vegetation, as well as man-made structures, within the Project Area that are suitable to support nesting birds, including shoreline nesting waterfowl and open ground nesters such as killdeer (*Charadrius vociferus*). Most native bird species and their active nests (i.e., with eggs or young) are protected from unlawful take by the federal Migratory Bird Treaty Act of 1918 (MBTA). Additionally, the State of California provides protection for native bird species and their nests in the FGC under Sections 3503, 3503.5, 3511, 3513, and 3800, respectively (Appendix D). Bird nesting protections in the FGC include the following (Sections 3503, 3503.5, 3511, 3513 and 3800):

- Section 3503 prohibits the take, possession, or needless destruction of the nest or eggs of any bird.
- Section 3503.5 prohibits the take, possession, or needless destruction of any nests, eggs, or birds in the orders Falconiformes (new world vultures, hawks, eagles, ospreys, and falcons, among others), and Strigiformes (owls).
- Section 3511 prohibits the take or possession of Fully Protected birds.
- Section 3513 prohibits the take or possession of any migratory nongame bird or part thereof, as designated in the MBTA. To avoid violation of the take provisions, it is generally required that Project-related disturbance at active nesting territories be reduced or eliminated during the nesting cycle.
- Section 3800 prohibits the take of any any non-game bird (i.e., bird that is naturally occurring in California that is not a gamebird, migratory game bird, or fully protected bird).

5. Conclusions and Recommendations

5.1 Special Status Biological Resources

A BRA and floristic botanical field surveys, which included 100% visual coverage of the undeveloped aspects of the Project, as well as the road shoulder along the proposed conveyance pipeline alternatives in the developed neighborhoods, was conducted by Jacobs in June and July of 2022 and July of 2023 to identify potential habitat for special status plant and wildlife species within the Project Area. The result of the BRA and floristic botanical field surveys was that the state and federally listed as endangered bird-foot checkerbloom was observed within and adjacent the proposed footprints for the Baldwin Lake conveyance pipeline alternative and the proposed solar evaporation ponds, within Baldwin Lake. Several other state and/or federally listed plant species have been documented within or adjacent the proposed Project footprint including the federally listed as threatened ash-gray paintbrush, the federally listed as endangered San Bernardino blue grass and California dandelion, as well as the state and federally listed as endangered slender-petaled thelypodium. However, none of these species were observed within the proposed Project footprint during the surveys. As identified in Appendix A, the Big Bear Valley milk-vetch (*Astragalus lentiginosus* var. *sierrae*) was also observed within and adjacent the proposed footprints for the Baldwin Lake conveyance pipeline alternative and the proposed solar evaporation ponds, within Baldwin Lake. However, this CNPS rare plant species is not state or federally listed as threatened or endangered.

No protocol level focused surveys were conducted for state and/or federally listed wildlife species known to occur in the Project vicinity and none were observed during the reconnaissance level BRA survey or floristic botanical field surveys. However, there is some potentially suitable habitat for the state listed as threatened southern rubber boa within and adjacent the Baldwin Lake conveyance pipeline alternative and possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline, as well as adjacent the Sand Canyon discharge outlet and portions of the Sand Canyon conveyance pipeline. Although, Big Bear and Baldwin Lakes are known to support overwintering migratory populations of the state listed as endangered (federally delisted) BAEA, the Project Area is not suitable to support nesting BAEA and the Project is not likely to adversely affect this species. Shay Pond supports a known population of the state and federally listed as endangered UTS. However, the Project is expected to benefit UTS and is not likely to adversely affect this species either.

The Project Area does not contain any USFWS designated Critical Habitat for federally listed species, and the Project will not result in any loss or adverse modification of Critical Habitat. Furthermore, the proposed Project will not affect any resources protected under the Coastal Barriers Resources Act, Coastal Zone Management Act, Fish and Wildlife Conservation Act, Magnuson-Stevens Fishery Conservation and Management Act, the Protection of Wetlands – Executive Order 11990 or Wild and Scenic Rivers Act, respectively.

According to accepted protocols and standard practices, the results of the surveys will remain valid for the period of one year, or until July 2024, after which time, if the site has not been disturbed in the interim, additional surveys may be warranted to determine the persisting absence of special status flora and fauna on-site. Regardless of survey results and conclusions given herein, the special status species identified in this report are protected by applicable state and/or federal laws, including but not exclusive to the federal ESA and CESA. As such, if a listed species is found on site during preconstruction surveys or work activities, all activities likely to affect the species should cease immediately and regulatory agencies should be contacted to determine appropriate management actions. Additionally, it should be noted that listed species may be handled only by a qualified biologist who has been given authorization by the appropriate agencies (i.e., USFWS and CDFW).

Project components that may affect federally listed threatened or endangered species would require ESA Section 7 Consultation (informal and/or formal) with the USFWS prior to implementation. Unavoidable Project related

impacts to state listed species would require an incidental take permit from the CDFW, in accordance with Section 2081(b) of the CESA. Therefore, it is recommended that the Project Proponent incorporate alternatives and specific precautionary measures and Best Management Practices (BMPs) into the Project design that would ensure potential Project related impacts to state and/or federally listed species are avoided. Specific precautionary avoidance measures are provided below.

Special Status Plant Species

Several special status plant species have been documented in the vicinity of the possible replacement pipeline alignment from the BBARWA WWTP to the Shay Pond conveyance pipeline including the federally listed as endangered San Bernardino blue grass and California dandelion, and the state and federally listed as endangered slender-petaled thelypodium. However, the Project Proponent does not anticipate utilizing this alignment to convey water to the new Shay Pond conveyance pipeline and this alignment was not included in the floristic botanical field surveys. Should replacement of the existing pipeline to the new Shay Pond conveyance pipeline be required, additional surveys would be necessary prior to implementation of Project activities, to assess potential Project related effects on San Bernardino blue grass, California dandelion, slender-petaled thelypodium, and other special status species that may occur in this area. Additionally, the following precautionary measures are recommended to avoid any potential Project related effects on the state and federally listed as endangered bird-foot checkerbloom:

- It is recommended that the Project Proponent avoid implementing the Baldwin Lake conveyance pipeline alternative, if feasible. Additionally, the proposed solar evaporation ponds should be designed to avoid areas where bird-foot checkerbloom are known to occur (Figure 11, Page 43).

- The Project disturbance limits should be clearly marked and limited to previously disturbed areas (e.g., previously graded areas), where feasible.

- Preconstruction clearance surveys should be conducted by a qualified biologist who is familiar with the local flora, to determine if any special status plant species are present within the proposed disturbance area prior to construction. Botanical surveys should be conducted during the appropriate time of year, when target species are both evident and identifiable.

- If any listed plant species are found within the proposed disturbance area(s), then orange construction fencing, or similarly visible material should be installed around the area where they are located, and this area should be completely avoided.

Special Status Wildlife

The Project may affect but is not likely to adversely affect the state and federally listed as endangered UTS, the state listed (federally delisted) as endangered BAEA, and the state listed as threatened southern rubber boa. Additionally, there is a moderate potential for the California SSC San Bernardino flying squirrel to occur in the Project Area. Therefore, the following precautionary measures are recommended to avoid or minimize any potential Project related effects on UTS, BAEA, rubber boa, and flying squirrel:

- All construction activities associated with the Shay Pond conveyance pipeline and discharge outlet should be restricted to the existing unpaved access road (Cascade Street) and adjacent upland areas. All disturbance within the wetted portions of Shay Pond/Shay Creek should be avoided.

- Appropriate BMPs (e.g., silt fence) should be implemented during construction to ensure that no sediment or pollutants enter Shay Pond/Shay Creek and potentially impact UTS and/or their habitat.

- It is recommended that all construction activities associated with the proposed solar evaporation ponds be conducted when the portion of Baldwin Lake where this Project component will occur is dry, to avoid or minimize potential Project related disturbance to BAEA.

- A preconstruction rubber boa survey is recommended that would provide 100% visual coverage of any undeveloped areas within the proposed Project footprint and would consist of a systematic ground search that would focus on moveable surface materials such as rocks, logs, duff, and man-made debris that may provide shelter for rubber boa.

- It is recommended that rubber boa exclusion fence (e.g., silt fence) be installed around the perimeter of the Sand Canyon discharge outlet construction site prior to commencement of any Project related ground disturbing activities in this area. All construction activities should be restricted to within the fenced disturbance limits to avoid potential harm to rubber boa that may be present in nearby habitat.

- A qualified biologist who is familiar with southern rubber boa and their habits should be present on site during initial ground disturbing activities within or adjacent any potential rubber boa habitat to monitor the clearing/removal of any surface objects that could potentially provide rubber boa refugia or hibernacula (e.g., rotting logs/stumps, duff layer). The biological monitor should visually inspect under any surface cover objects prior to their removal to ensure no rubber boa are harmed or killed.

- All open trenches should be backfilled or covered at the end of the day and ramped to allow rubber boa and other wildlife to escape.

- If a rubber boa is found during preconstruction presence/absence surveys or during construction activities, all Project activities shall be halted, CDFW shall be contacted, and a CESA Incidental Take Permit shall be obtained from CDFW prior to reinitiating Project activities.

- To ensure the Project does not impact flying squirrel, it is recommended that a preconstruction survey be conducted to identify potentially suitable cavity nesting sites and foraging habitat, prior to the removal of any trees or downed woody debris.

- If suitable flying squirrel cavity nesting sites are detected within the proposed Project footprint, then coordination with the CDFW would be necessary to determine appropriate minimization and mitigation measures to offset Project related impacts to this species.

Nesting Birds

Although BAEA and SPOW are not likely to nest in the Project Area due to existing disturbances within and adjacent the proposed Project footprint, the Project Area is suitable to support other nesting bird species. Most native bird species are protected from unlawful take by the MBTA (Appendix D). Additionally, the State of California provides protection for native bird species and their nests in the FGC (Appendix D). In general, impacts to all bird species (common and special status) can be avoided by conducting work outside of the nesting season, which is generally February 1st through August 31st. However, if all work cannot be conducted outside of nesting season, the following precautionary measures are recommended to ensure MBTA compliance:

- Vegetation removal, including any tree removal or pruning, and structure demolition should be conducted outside the typical nesting season (i.e., between September 1st and January 31st).

- To avoid impacts to nesting birds (common and special status) during the nesting season, a qualified Avian Biologist should conduct preconstruction nesting bird surveys prior to Project related disturbance to suitable nesting areas to identify any active nests. The nesting bird surveys should consist of a minimum of five (5) consecutive survey days and should include an additional three (3) consecutive nights of survey for nocturnal species. Nocturnal surveys should be conducted between the hours of 9:00 pm. and midnight, during appropriate weather conditions (e.g., no rain or winds).

- If no active nests are found, no further action would be required. If an active nest is found, the biologist should set appropriate no-work buffers around the nest which would be based upon the nesting species, its sensitivity to disturbance, nesting stage and expected types, intensity, and duration of disturbance. The nest(s) and buffer zones should be field checked weekly by a qualified biological monitor. The approved no-work buffer zone should be clearly marked in the field, within which no disturbance activity should commence until the qualified biologist has determined the young birds have successfully fledged and the nest is inactive.

Lighting Impacts

To avoid potential impacts to nocturnal species such as SPOW and flying squirrel, due to light pollution, Project related night lighting (both temporary and permanent) should be directed away from adjacent areas to protect nocturnal species from direct night lighting. Shielding should be incorporated in Project designs to ensure ambient lighting in adjacent areas is not increased.

5.2 Jurisdictional Waters

In addition to the BRA field survey, Jacobs also assessed the proposed Project footprint for the presence of any state and/or federal jurisdictional waters. Stanfield Marsh is a jurisdictional wetland that is subject to the CWA and FGC under the jurisdictions of the USACE, RWQCB, and CDFW, respectively (Figure 12a, Page 53). Therefore, any proposed permanent or temporary impacts to Stanfield Marsh associated with the Stanfield Marsh conveyance pipeline discharge outlet may require CWA Sections 404/401 permits from the USACE and RWQCB, as well as a LSA Agreement from the CDFW. Baldwin Lake, Caribou Creek, Shay Pond/Shay Creek, and the Sand Canyon Channel are all waters of the State of California (Figures 12b-12e, Pages 54-57). Therefore, potential Project related impacts to these aquatic resources would likely require RWQCB issued WDRs, as well as a CDFW issued LSA. Prior to implementation of any Project components that may impact state and/or federal jurisdictional waters, a formal jurisdictional delineation should be conducted by a qualified delineation specialist to determine the extent of any potential Project related impacts to aquatic resources and the appropriate regulatory permitting (if any) required.

USACE 404 Permit

The two most common types of permits issued by USACE under Section 404 of the CWA to authorize the discharge of dredged or fill material into WOTUS are: a nation-wide permit (NWP) or an individual permit (IP). NWPs are general permits for specific categories of activities that result in minimal impacts to aquatic resources. The discharge must not cause the loss of greater than ½ acre to WOTUS, including the loss of no more than 300 linear feet of streambed. Projects that would exceed these limits would likely require an IP.

The projects under this Program that may require CWA Section 404 permitting through the USACE are the following:

- Stanfield Marsh Conveyance Pipeline Discharge Outlet(s)

Regional Water Quality Control Board 401 Certification

The Project Area is within the jurisdiction of the Santa Ana RWQCB (Regional Board 8). Under Section 401 of the CWA, the RWQCB must certify that the discharge of dredged or fill material into WOTUS does not violate state water quality standards. The RWQCB also regulates impacts to Waters of the State of California under the Porter Cologne Water Quality Control Act through issuance of a Construction General Permit, State General Waste Discharge Order, or WDRs, depending upon the level of impact and the waterway. In addition to the formal application materials and fee (based on area of impact), a copy of the appropriate CEQA documentation must be included with the application.

The projects under this Program that may require CWA Section 401 Water Quality Certification through the RWQCB are the following:

- Stanfield Marsh Conveyance Pipeline Discharge Outlet(s)

Additionally, the projects under this Program that may require WDRs issued by the RWQCB are the following:

- Baldwin Lake Conveyance Pipeline Alternative
- BBARWA WWTP Evaporation Ponds
- Sand Canyon Conveyance Pipeline Discharge Outlet
- Shay Pond Conveyance Pipeline Discharge Outlet
- Possible Replacement Pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline (not expected)

FGC Section 1602 Lake or Streambed Alteration Agreement

A FGC Section 1602 LSA Agreement is required for all activities that alter streams and lakes and their associated riparian habitat. In addition to the formal application materials and fee (based on cost of the Project), a copy of the appropriate CEQA documentation must be included with the application.

The projects under this Program that may require FGC Section 1602 LSA Agreement with the CDFW are the following:

- Stanfield Marsh Conveyance Pipeline Discharge Outlet(s)
- Baldwin Lake Conveyance Pipeline Alternative
- BBARWA WWTP Evaporation Ponds
- Sand Canyon Conveyance Pipeline Discharge Outlet
- Shay Pond Conveyance Pipeline Discharge Outlet
- Possible Replacement Pipeline from the BBARWA WWTP to the Shay Pond Conveyance Pipeline (not expected)

Special Status Species Occurrence Potential Analysis

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Acanthoscyphus parishii var. *cienegensis*	Cienega Seca oxytheca	None/ None	G4?T2; S2; CNPS: 1B.3	Upper montane coniferous forest, pinyon and juniper woodland, Joshua tree woodland. Dry gravelly banks and granitic sand. 1920-2560 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley. Occurrence potential is low.
Acanthoscyphus parishii var. *goodmaniana*	Cushenbury oxytheca	Endangered/ None	G4?T1; S1; CNPS: 1B.1	Pinyon and juniper woodland. On limestone talus and rocky slopes. 1400-2350 m.	The pinyon-juniper woodland habitat this species is associated with is absent from the Project Area and the nearest documented occurrence for this species is approx. 4.1 miles NW of the site. Occurrence potential is low.
Accipiter cooperii	Cooper's hawk	None/ None	G5; S4; CDFW: WL	Woodland, chiefly of open, interrupted, or marginal type. Nest sites mainly in riparian growths of deciduous trees, as in canyon bottoms on river floodplains; also, live oaks.	The only documented occurrence for this species in the 4-quad CNDDB query is a historic collection (1886) from approx. 7.5 miles NW of the site. Occurrence potential is low.
Anniella stebbinsi	Southern California legless lizard	None/ None	G3; S3; CDFW: SSC	Generally, south of the Transverse Range, extending to northwestern Baja California. Occurs in sandy or loose loamy soils under sparse vegetation. Disjunct populations in the Tehachapi and Piute Mountains in Kern County. Variety of habitats; generally, in moist, loose soil. They prefer soils with a high moisture content.	This species has not been documented in the Big Bear Valley since 1966. Occurrence potential is low.
Antennaria marginata	white-margined everlasting	None/ None	G4G5; S1; CNPS: 2B.3	Lower montane coniferous forest, upper montane coniferous forest. Dry woods. 2070-3355 m.	The habitats this species is associated with are absent from the proposed Project footprint. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Aquila chrysaetos	golden eagle	None/ None	G5; S3; CDFW: FP	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	The site is situated in an urban/semi-urban setting and is subject to existing human disturbance. Furthermore, the nearest documented occurrence for this species is approx. 4.8 miles NW of the Project Area and this species has not been documented nesting in the Big Bear Valley area. Occurrence potential is low.
Arenaria lanuginosa var. *saxosa*	rock sandwort	None/ None	G5T5; S2; CNPS: 2B.3	Subalpine coniferous forest, upper montane coniferous forest. Mesic, sandy sites. 1920-2935 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley. Occurrence potential is low.
Astragalus albens	Cushenbury milk-vetch	Endangered/ None	G1; S1; CNPS: 1B.1	Joshua tree woodland, Mojavean desert scrub, pinyon and juniper woodland. Sandy or stony flats, rocky hillsides, canyon washes, and fans, on carbonate or mixed granitic-calcareous debris. 1185-1950 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.
Astragalus bernardinus	San Bernardino milk-vetch	None/ None	G3; S3; CNPS: 1B.2	Joshua tree woodland, pinyon and juniper woodland. Granitic or carbonate substrates. 290-2290 m.	The only documented occurrence for this species in the 4-quad CNDDB query is a historic collection (1924) from approx. 1.4 miles NW of the site. Occurrence potential is low.
Astragalus lentiginosus var. *sierrae*	Big Bear Valley milk-vetch	None/ None	G5T2; S2; CNPS: 1B.2	Mojavean desert scrub, meadows and seeps, pinyon and juniper woodland, upper montane coniferous forest. Stony meadows and open pinewoods; sandy and gravelly soils in a variety of habitats. 1710-3230 m.	This species is present within the proposed Baldwin Lake conveyance pipeline alternative and BBARWA WWTP solar evaporation ponds components.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Astragalus leucolobus	Big Bear Valley woollypod	None/ None	G2; S2; CNPS: 1B.2	Lower montane coniferous forest, pebble plain, pinyon and juniper woodland, upper montane coniferous forest. Dry pine woods, gravelly knolls among sagebrush, or stony lake shores in the pine belt. 1460-2895 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Astragalus tidestromii	Tidestrom's milk-vetch	None/ None	G4; S2; CNPS: 2B.2	Mojavean desert scrub. Washes, in sandy or gravelly soil. On limestone. 765-1575 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Atriplex parishii	Parish's brittlescale	None/ None	G1G2; S1; CNPS: 1B.1	Vernal pools, chenopod scrub, playas. Usually on drying alkali flats with fine soils. 4-1420 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Berberis fremontii	Fremont barberry	None/ None	G5; S3; CNPS: 2B.3	Pinyon and juniper woodland, Joshua tree woodland. Rocky, sometimes granitic. 1140-1770 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Boechera dispar	pinyon rockcress	None/ None	G3; S3; CNPS: 2B.3	Joshua tree woodland, pinyon and juniper woodland, Mojavean desert scrub. Granitic, gravelly slopes and mesas. Often under desert shrubs which support it as it grows. 1005-2805 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Boechera lincolnensis	Lincoln rockcress	None/ None	G4G5; S3; CNPS: 2B.3	Chenopod scrub, Mojavean desert scrub. On limestone. 880-2410 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Boechera parishii	Parish's rockcress	None/ None	G2; S2; CNPS: 1B.2	Pebble plain, pinyon and juniper woodland, upper montane coniferous forest. Generally found on pebble plains on clay soil with quartzite cobbles, sometimes on limestone. 1825-2805 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Boechera shockleyi	Shockley's rockcress	None/ None	G3; S2; CNPS: 2B.2	Pinyon and juniper woodland. On ridges, rocky outcrops and openings on limestone or quartzite. 875-2515 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Bombus caliginosus	obscure bumble bee	None/ None	G4?; S1S2	Coastal areas from Santa Barbara County to north to Washington state. Food plant genera include *Baccharis, Cirsium, Lupinus, Lotus, Grindelia* and *Phacelia*.	The Project Area is outside the current known range for this species and the food plants for this species are sparse within the Project Area. Occurrence potential is low.
Bombus crotchii	Crotch bumble bee	None/ Candidate Endangered	G3G4; S1S2	Coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include *Antirrhinum, Phacelia, Clarkia, Dendromecon, Eschscholzia,* and *Eriogonum*.	The food plants for this species are sparse within the Project Area and the nearest documented occurrence for this species (1999) is approx. 5.6 miles NE of the Project Area. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Bombus morrisoni	Morrison bumble bee	None/ None	G4G5; S1S2	From the Sierra-Cascade ranges eastward across the intermountain west. Food plant genera include *Cirsium, Cleome, Helianthus, Lupinus, Chrysothamnus,* and *Melilotus*.	The food plants for this species are sparse within the Project Area and the nearest documented occurrence for this species (1999) is approx. 4.9 miles NW of the Project Area. Occurrence potential is low.
Botrychium crenulatum	scalloped moonwort	None/ None	G4; S3; CNPS: 2B.2	Bogs and fens, meadows and seeps, upper montane coniferous forest, lower montane coniferous forest, marshes, and swamps. Moist meadows, freshwater marsh, and near creeks. 1185-3110 m.	Some of the habitat this species is associated with is present in the Project vicinity, but the nearest documented occurrence is approx. 5.7 miles SE of the Project Area. Occurrence potential is low.
Calochortus palmeri var. *palmeri*	Palmer's mariposa-lily	None/ None	G3T2; S2; CNPS: 1B.2	Meadows and seeps, chaparral, lower montane coniferous forest. Vernally moist places in yellow-pine forest, chaparral. 195-2530 m.	Some of the habitat this species is associated with is present in the Project vicinity and the nearest documented occurrence is approx. 1.3 miles N of the Project Area. Occurrence potential is moderate.
Calochortus plummerae	Plummer's mariposa-lily	None/ None	G4; S4; CNPS: 4.2	Coastal scrub, chaparral, valley and foothill grassland, cismontane woodland, lower montane coniferous forest. Occurs on rocky and sandy sites, usually of granitic or alluvial material. Can be very common after fire. 60-2500 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley area. Occurrence potential is low.
Calochortus striatus	alkali mariposa-lily	None/ None	G3?; S2S3; CNPS: 1B.2	Chaparral, chenopod scrub, Mojavean desert scrub, meadows, and seeps. Alkaline meadows and ephemeral washes. 70-1600m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Calyptridium pygmaeum	pygmy pussypaws	None/ None	G1G2; S1S2; CNPS: 1B.2	Upper montane coniferous forest, subalpine coniferous forest. Sandy or gravelly sites. 2145-3415 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, the nearest documented occurrence for this species is approx. 2.8 miles N of the site. Occurrence potential is low.
Carex occidentalis	western sedge	None/ None	G4; S3; CNPS: 2B.3	Lower montane coniferous forest, meadows and seeps. 1645-2320 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Castilleja cinerea	ash-gray paintbrush	Threatened/ None	G1G2; S1S2; CNPS: 1B.2	Pebble plains, upper montane coniferous forest, Mojavean desert scrub, meadows and seeps, pinyon and juniper woodland. Endemic to the San Bernardino Mountains, in clay openings; often in meadow edges. 725-2860 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species was absent at the time of survey (June-July 2022; July 2023).
Castilleja lasiorhyncha	San Bernardino Mountains owl's-clover	None/ None	G2?; S2?; CNPS: 1B.2	Meadows and seeps, pebble plain, upper montane coniferous forest, chaparral, riparian woodland. Mesic to drying soils in open areas of stream and meadow margins or in vernally wet areas. 1140-2320 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Chaetodipus fallax pallidus	pallid San Diego pocket mouse	None/ None	G5T34; S3S4; CDFW: SSC	Desert border areas in eastern San Diego County in desert wash, desert scrub, desert succulent scrub, pinyon-juniper, etc. Sandy, herbaceous areas, usually in association with rocks or coarse gravel.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Charina umbratica	southern rubber boa	None/ Threatened	G2G3; S2S3	Known from the San Bernardino and San Jacinto mtns; found in a variety of montane forest habitats. Snakes resembling *C. umbratica* reported from Mt. Pinos and Tehachapi mtns group with *C. bottae* based on mtDNA. Further research needed. Found in vicinity of streams or wet meadows; requires loose, moist soil for burrowing; seeks cover in rotting logs, rock outcrops, and under surface litter.	There is some marginally suitable rubber boa habitat in the Project Area and the nearest documented rubber boa occurrence (2013) is approx. 0.5 mile N of the site. Occurrence potential is low-moderate.
Claytonia peirsonii ssp. *bernardinus*	San Bernardino spring beauty	None/ None	G2G3T1; S1; CNPS: 1B.1	Pinyon and juniper woodland, upper montane coniferous forest. Rocky, talus slopes, carbonate, usually openings. 2360-2465 m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.
Claytonia peirsonii ssp. *californacis*	Furnace spring beauty	None/ None	G2G3T1; S1; CNPS: 1B.1	Pinyon and juniper woodland, upper montane coniferous forest. Rocky, talus slopes, carbonate, usually openings. 2300 m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.
Corynorhinus townsendii	Townsend's big-eared bat	None/ None	G3G4; S2; CDFW: SSC	Throughout California in a wide variety of habitats. Most common in mesic sites. Roosts in the open, hanging from walls and ceilings. Roosting sites limiting. Extremely sensitive to human disturbance.	There are no suitable roosting sites for this species in the Project Area. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Cymopterus multinervatus	purple-nerve cymopterus	None/ None	G4G5; S2; CNPS: 2B.2	Mojavean desert scrub, pinyon and juniper woodland. Sandy or gravelly places. 765-2195 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Drymocallis cuneifolia var. *cuneifolia*	wedgeleaf woodbeauty	None/ None	G2T1; S1; CNPS: 1B.1	Upper montane coniferous forest, riparian scrub. Sometimes on carbonate. 1520-2220 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Dryopteris filix-mas	male fern	None/ None	G5; S2; CNPS: 2B.3	Upper montane coniferous forest. In granite crevices. 1855-3075 m.	The habitats this species is associated with are absent from the Project Area and the only documented occurrence for this species in the 4-quad CNDDB query is a historical collection (1882) and the site consists of graded/developed land. Therefore, this species is presumed absent from the proposed Project footprint.
Dudleya abramsii ssp. *affinis*	San Bernardino Mountains dudleya	None/ None	G4T2; S2; CNPS: 1B.2	Pebble (pavement) plain, upper montane coniferous forest, pinyon and juniper woodland. Outcrops, granite, or quartzite, rarely limestone. 1200-2425 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Empidonax traillii extimus	southwestern willow flycatcher	Endangered/ Endangered	G5T2; S1	Riparian woodlands in Southern California.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.
Ensatina eschscholtzii klauberi	large-blotched salamander	None/ None	G5T2?; S3; CDFW: WL	Found in conifer and woodland associations. Found in leaf litter, decaying logs and shrubs in heavily forested areas.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Eremogone ursina	Big Bear Valley sandwort	Threatened/ None	G1; S1; CNPS: 1B.2	Pebble plain, pinyon and juniper woodland, meadows and seeps. Mesic, rocky sites. 1795-2895 m.	The habitats this species is associated with are absent from the Project Area this species was absent at the time of survey (June-July 2022; July 2023).
Erigeron parishii	Parish's daisy	Threatened/ None	G2; S2; CNPS: 1B.1	Mojavean desert scrub, pinyon and juniper woodland. Often on carbonate; limestone mountain slopes; often associated with drainages. Sometimes on granite. 1050-2245 m.	The habitats this species is associated with are absent from the Project Area this species was absent at the time of survey (June-July 2022; July 2023).
Eriogonum evanidum	vanishing wild buckwheat	None/ None	G2; S1; CNPS: 1B.1	Chaparral, cismontane woodland, lower montane coniferous forest, pinyon and juniper woodland. Sandy sites. 975-2240 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, the nearest documented occurrence for this species is approx. 2.3 miles NW of the site. Occurrence potential is low.
Eriogonum kennedyi var. *alpigenum*	southern alpine buckwheat	None/ None	G4T3; S3; CNPS: 1B.3	Alpine boulder and rock fields, subalpine coniferous forest. Dry granitic gravel. 2500-3415 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Eriogonum kennedyi var. *austromontanum*	southern mountain buckwheat	Threatened/ None	G4T2; S2; CNPS: 1B.2	Pebble (pavement) plain, lower montane coniferous forest. Usually found in pebble plain habitats. 1765-3020 m.	The habitats this species is associated with are absent from the Project Area this species was absent at the time of survey (June-July 2022; July 2023).
Eriogonum microthecum var. *johnstonii*	Johnston's buckwheat	None/ None	G5T2; S2; CNPS: 1B.3	Subalpine coniferous forest, upper montane coniferous forest. Slopes and ridges on granite or limestone. 1795-2865 m	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Eriogonum microthecum var. *lacus-ursi*	Bear Lake buckwheat	None/ None	G5T1; S1; CNPS: 1B.1	Lower montane coniferous forest, Great Basin scrub. Clay outcrops. 2000-2100 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, there is only one documented occurrence for this species (2003) in the 4-quad CNDDB query and it is approx. 2.6 miles SW of the site. Occurrence potential is low.
Eriogonum ovalifolium var. *vineum*	Cushenbury buckwheat	Endangered/ None	G5T1; S1; CNPS: 1B.1	Mojavean desert scrub, pinyon and juniper woodland, Joshua tree woodland. Limestone mountain slopes. Dry, usually rocky places. 1430-2440 m.	The habitats this species is associated with are absent from the Project Area this species was absent at the time of survey (June-July 2022; July 2023).
Erythranthe exigua	San Bernardino Mountains monkeyflower	None/ None	G2; S2; CNPS: 1B.2	Meadows and seeps, pebble plains, upper montane coniferous forest. Seeps and sandy sometimes disturbed soil in moist drainages of annual streams; clay soils. 2060-2630 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Erythranthe purpurea	little purple monkeyflower	None/ None	G2; S2; CNPS: 1B.2	Meadows and seeps, pebble plain, upper montane coniferous forest. Dry clay or gravelly soils under Jeffrey pines, along annual streams or vernal springs and seeps. 2045-2290 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Euchloe hyantis andrewsi	Andrew's marble butterfly	None/ None	G3G4T1; S1	Inhabits yellow pine forest near Lake Arrowhead and Big Bear Lake, San Bernardino Mtns, San Bernardino Co, 5,000-6,000 ft. Hostplants are *Streptanthus bernardinus* and *Arabis holboellii* var. *pinetorum*; larval foodplant is *Descurainia richardsonii*.	The host and food plant species for this species are absent from the proposed Project footprint. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Euphydryas editha quino	quino checkerspot butterfly	Endangered/ None	G5T1T2; S1S2	Sunny openings within chaparral and coastal sage shrublands in parts of Riverside and San Diego counties. Hills and mesas near the coast. Need high densities of food plants *Plantago erecta, P. insularis,* and *Orthocarpus purpurescens*.	The Project Area is outside the current known range of this species and there is no suitable habitat for this species within the Project Area. Occurrence potential is low.
Gasterosteus aculeatus williamsoni	unarmored threespine stickleback	Endangered/ Endangered	G5T1; S1; CDFW: FP	Weedy pools, backwaters, and among emergent vegetation at the stream edge in small Southern California streams. Cool (<24 C), clear water with abundant vegetation.	This species is presumed present within Shay Pond.
Gentiana fremontii	Fremont's gentian	None/ None	G4; S2; CNPS: 2B.3	Meadows and seeps, upper montane coniferous forest. Wet mountain meadows. 2400-2700 m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.
Gilia leptantha ssp. *leptantha*	San Bernardino gilia	None/ None	G4T2; S2; CNPS: 1B.3	Lower montane coniferous forest. Sandy or gravelly sites. 1520-2595 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species has not been documented in the Project vicinity since 1926. Occurrence potential is low.
Glaucomys oregonensis californicus	San Bernardino flying squirrel	None/ None	G5T1T2; S1S2; CDFW: SSC	Known from black oak or white fir dominated woodlands between 5,200 – 8,500 ft in the San Bernardino and San Jacinto ranges. May be extirpated from San Jacinto range. Needs cavities in trees/snags for nests and cover. Needs nearby water.	Although the site is situated in an urban/semi-urban setting and is subject to a high level of existing human disturbance, this species has been documented in residential areas and the nearest documented occurrence (2015) is approx. 0.4 miles N of the proposed Project footprint. Occurrence potential is moderate.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Haliaeetus leucocephalus	bald eagle	Delisted/ Endangered	G5; S3; CDFW: FP	Ocean shore, lake margins, and rivers for both nesting and wintering. Most nests within 1 mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.	There is some shoreline habitat suitable to support wintering BAEA within the Project Area. Occurrence potential is moderate.
Heuchera parishii	Parish's alumroot	None/ None	G3; S3; CNPS: 1B.3	Lower montane coniferous forest, subalpine coniferous forest, upper montane coniferous forest, alpine boulder and rock field. Rocky places. Sometimes on carbonate. 1340-3505 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Horkelia wilderae	Barton Flats horkelia	None/ None	G1; S1; CNPS: 1B.1	Lower montane coniferous forest, upper montane coniferous forest, chaparral. On rocky, north aspects in openings that hold persistent snowdrifts. 1980-2895 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species has not been documented in the Big Bear Valley area. Occurrence potential is low.
Hulsea vestita ssp. pygmaea	pygmy hulsea	None/ None	G5T1; S1; CNPS: 1B.3	Alpine boulder and rock field, subalpine coniferous forest. Gravelly sites; on granite. 2860-3502 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Hydroporus simplex	simple hydroporus diving beetle	None/ None	G1?; S1?	Known from aquatic habitats in Tuolumne and San Bernardino counties.	The aquatic habitats required by this species are present in the Project Area but the only documented occurrence for this species in the 4-quad CNDDB query is from approx. 2.9 miles N of the site. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Icteria virens	yellow-breasted chat	None/ None	G5; S3; CDFW: SSC	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Nests in low, dense riparian, consisting of willow, blackberry, wild grape; forages and nests within 10 ft of ground.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.
Ivesia argyrocoma var. *argyrocoma*	silver-haired ivesia	None/ None	G2T2; S2; CNPS: 1B.2	Meadows and seeps, pebble plains, upper montane coniferous forest. In pebble plains and meadows with other rare plants. 1490-2960 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Lewisia brachycalyx	short-sepaled lewisia	None/ None	G4; S2; CNPS: 2B.2	Lower montane coniferous forest, meadows and seeps. Dry to moist meadows in rich loam. 1400-2290 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Lilium parryi	lemon lily	None/ None	G3; S3; CNPS: 1B.2	Lower montane coniferous forest, meadows and seeps, riparian forest, upper montane coniferous forest. Wet, mountainous terrain; generally, in forested areas; on shady edges of streams, in open boggy meadows and seeps. 625-2930 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Linanthus killipii	Baldwin Lake linanthus	None/ None	G1; S1; CNPS: 1B.2	Alkaline meadows, pebble plain, pinyon and juniper woodland, Joshua tree woodland. Usually on pebble plains with other rare species. 1645-2645 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Malaxis monophyllos var. *brachypoda*	white bog adder's-mouth	None/ None	G4?T4; S1; CNPS: 2B.1	Meadows and seeps, bogs and fens, upper montane coniferous forest. Hillside bogs and mesic meadows. 2375-2560 m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.
Myotis evotis	long-eared myotis	None/ None	G5; S3	Found in all brush, woodland, and forest habitats from sea level to about 9,000 ft. Prefers coniferous woodlands and forests. Nursery colonies in buildings, crevices, spaces under bark, and snags. Caves used primarily as night roosts.	Some suitable habitat for this species exists in the Project vicinity. Occurrence potential is moderate.
Myotis thysanodes	fringed myotis	None/ None	G4; S3	In a wide variety of habitats, optimal habitats are pinyon-juniper, valley foothill hardwood and hardwood-conifer. Uses caves, mines, buildings or crevices for maternity colonies and roosts.	Some suitable habitat for this species exists in the Project vicinity. Occurrence potential is moderate.
Myotis volans	long-legged myotis	None/ None	G5; S3	Most common in woodland and forest habitats above 4,000 ft. Trees are important day roosts; caves and mines are night roosts. Nursery colonies usually under bark or in hollow trees, but occasionally in crevices or buildings.	Some suitable habitat for this species exists in the Project vicinity. Occurrence potential is moderate.
Myotis yumanensis	Yuma myotis	None/ None	G5; S4	Optimal habitats are open forests and woodlands with sources of water over which to feed. Distribution is closely tied to bodies of water. Maternity colonies in caves, mines, buildings or crevices.	Some suitable habitat for this species exists in the Project vicinity. Occurrence potential is moderate.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Navarretia peninsularis	Baja navarretia	None/ None	G3; S2; CNPS: 1B.2	Lower montane coniferous forest, chaparral, meadows and seeps, pinyon and juniper woodland. Wet areas in open forest. 1150-2365 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Neotamias speciosus speciosus	lodgepole chipmunk	None/ None	G4T2T3; S2S3	Summits of isolated Piute, San Bernardino, and San Jacinto mountains. Usually found in open-canopy forests. Habitat is usually lodgepole pine forests in the San Bernardino Mts and chinquapin slopes in the San Jacinto Mts.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.
Oncorhynchus mykiss irideus pop. 10	Steelhead – southern California DPS	Endangered/ None	G5T1Q; S1	Federal listing refers to populations from Santa Maria River south to southern extent of range (San Mateo Creek in San Diego County). Southern steelhead likely have greater physiological tolerances to warmer water and more variable conditions.	The aquatic habitats required by this species are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.
Oreonana vestita	woolly mountain-parsley	None/ None	G3; S3; CNPS: 1B.3	Subalpine coniferous forest, upper montane coniferous forest, lower montane coniferous forest. High ridges; on scree, talus, or gravel. 800-3370 m.	The habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Oxytropis oreophila var. *oreophila*	rock-loving oxytrope	None/ None	G5T4T5; S2; CNPS: 2B.3	Alpine boulder and rock field, subalpine coniferous forest. Gravelly or rocky sites. 2615-3505 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Packera bernardina	San Bernardino ragwort	None/ None	G2; S2; CNPS: 1B.2	Meadows and seeps, pebble plains, upper montane coniferous forest. Mesic, sometimes alkaline meadows, and dry rocky slopes. 1615-2470 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
	Pebble Plains	None/ None	G1; S1.1		There is no pebble plain or pebble plain-like habitat within the proposed Project footprint and pebble plain indicator species are absent from the proposed Project footprint.
Perideridia parishii ssp. *parishii*	Parish's yampah	None/ None	G4T3T4; S2; CNPS: 2B.2	Lower montane coniferous forest, meadows and seeps, upper montane coniferous forest. Damp meadows or along streambeds-prefers an open pine canopy. 1470-2530 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Phlox dolichantha	Big Bear Valley phlox	None/ None	G2; S2; CNPS: 1B.2	Pebble plains, upper montane coniferous forest. Sloping hillsides, in shade under pines and *Quercus kelloggii*, with heavy pine litter; also, in openings. 1980-2805 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Phrynosoma blainvillii	coast horned lizard	None/ None	G3G4; S3S4; CDFW: SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	This species has not been documented in the Big Bear Valley and the Project Area is likely outside the current range of this species. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Physaria kingii ssp. *bernardina*	San Bernardino Mountains bladderpod	Endangered/ None	G5T1; S1; CNPS: 1B.1	Pinyon and juniper woodland, lower montane coniferous forest, subalpine coniferous forest. Dry sandy to rocky carbonate soils. 1980-2590 m.	The habitats this species is associated with are absent from the Project Area this species was absent at the time of survey (June-July 2022; July 2023).
Piranga rubra	summer tanager	None/ None	G5; S1; CDFW: SSC	Summer resident of desert riparian along lower Colorado River, and locally elsewhere in California deserts. Requires cottonwood-willow riparian for nesting and foraging; prefers older, dense stands along streams.	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.
Poa atropurpurea	San Bernardino blue grass	Endangered/ None	G2; S2; CNPS: 1B.2	Meadows and seeps. Mesic meadows of open pine forests and grassy slopes, loamy alluvial to sandy loam soil. 1255-2655 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species was absent at the time of survey (June-July 2022; July 2023).
Poliomintha incana	frosted mint	None/ None	G5; SH; CNPS: 2A	Lower montane coniferous forest. In boggy soil. 1600-1700 m.	The Project Area is outside the known elevation range for this species. Occurrence potential is low.
Psychomastax deserticola	desert monkey grasshopper	None/ None	G1G2; S1S2	Occurs in very arid environments in the vicinity of the San Bernardino Mtns. Known to occur on chamise (*Adenostoma fasciculatum*).	No suitable habitat for this species exists within the Project Area. Occurrence potential is low.
Pyrrocoma uniflora var. *gossypina*	Bear Valley pyrrocoma	None/ None	G5T1; S1; CNPS: 1B.2	Pebble plain, meadows and seeps. Meadows, meadow edges, and along streams in or near pebble plain habitat. 2040-2280 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Rana muscosa	southern mountain yellow-legged frog	Endangered/ Endangered	G1; S1; CDFW: WL	Federal listing refers to populations in the San Gabriel, San Jacinto and San Bernardino mountains (southern DPS). Northern DPS was determined to warrant listing as endangered, Apr 2014, effective Jun 30, 2014. Always encountered within a few feet of water. Tadpoles may require 2 - 4 yrs. to complete their aquatic development.	The aquatic habitats required by this species are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.
Rosa woodsii var. *glabrata*	Cushenbury rose	None/ None	G5T1; S1; CNPS: 1B.1	Mojavean desert scrub. Springs. 1095-1220 m.	The Project Area is outside the known elevation range for this species and the habitats this species is associated with are absent from the Project Area. Therefore, this species is presumed absent from the proposed Project footprint.
Saltugilia latimeri	Latimer's woodland-gilia	None/ None	G3; S3; CNPS: 1B.2	Chaparral, Mojavean desert scrub, pinyon and juniper woodland. Rocky or sandy substrate; sometimes in washes, sometimes limestone. 120-2200 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley. Occurrence potential is low.
Sidalcea hickmanii ssp. *parishii*	Parish's checkerbloom	None/ Rare	G3T1; S1; CNPS: 1B.2	Chaparral, cismontane woodland, lower montane coniferous forest. Disturbed burned or cleared areas on dry, rocky slopes, in fuel breaks and fire roads along the mountain summits. 1095-2135 m.	The habitats this species is associated with are absent from the Project Area and this species has not been documented in the Big Bear Valley area. Therefore, this species is presumed absent from the proposed Project footprint.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Sidalcea malviflora ssp. *dolosa*	Bear Valley checkerbloom	None/ None	G5T2; S2; CNPS: 1B.2	Meadows and seeps, riparian woodland, lower montane coniferous forest, upper montane coniferous forest. Known from wet areas within forested habitats. Affected by hydrological changes. 1575-2590 m.	Some of the habitat this species is associated with is present in the Project vicinity and this species has been documented nearby. Occurrence potential is moderate.
Sidalcea pedata	bird-foot checkerbloom	Endangered/ Endangered	G1; S1; CNPS: 1B.1	Meadows and seeps, pebble plains. Vernally mesic sites in meadows or pebble plains. 1840-2305 m.	This species is present within the proposed Baldwin Lake conveyance pipeline alternative and BBARWA WWTP solar evaporation ponds components.
Sisyrinchium longipes	timberland blue-eyed grass	None/ None	G3G4; S1; CNPS: 2B.2	Meadows and seeps. Mesic areas in meadows; seeps. 2060 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley. Occurrence potential is low.
	Southern California Threespine Stickleback Stream	None/ None	GNR; SNR		This aquatic habitat is present within the Project Area.
Sphenopholis obtusata	prairie wedge grass	None/ None	G5; S2; CNPS: 2B.2	Cismontane woodland, meadows and seeps. Open moist sites, along rivers and springs, alkaline desert seeps. 15-2625 m.	Some of the habitat this species is associated with is present in the Project vicinity, but this species has not been documented in the Big Bear Valley. Occurrence potential is low.
Streptanthus bernardinus	Laguna Mountains jewelflower	None/ None	G3G4; S3S4; CNPS: 4.3	Chaparral, lower montane coniferous forest. Clay or decomposed granite soils; sometimes in disturbed areas such as stream sides or roadcuts. 1440-2500 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, the nearest documented occurrence is approx. 6.2 miles W of the site. Occurrence potential is low.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Streptanthus campestris	southern jewelflower	None/ None	G3; S3; CNPS: 1B.3	Chaparral, lower montane coniferous forest, pinyon and juniper woodland. Open, rocky areas. 605-2590 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, the only documented occurrence for this species is approx. 2.3 miles SW of the site. Occurrence potential is low.
Streptanthus juneae	June's jewelflower	None/ None	G2; S2 CNPS: 1B.2	Lower montane coniferous forest, chaparral (montane). Openings. 2155-2370 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, the only documented occurrence for this species is approx. 2.8 miles W of the site. Occurrence potential is low.
Symphyotrichum defoliatum	San Bernardino aster	None/ None	G2; S2; CNPS: 1B.2	Meadows and seeps, cismontane woodland, coastal scrub, lower montane coniferous forest, marshes and swamps, valley and foothill grassland. Vernally mesic grassland or near ditches, streams and springs; disturbed areas. 3-2045 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, there is only one documented occurrence for this species in the Big Bear Valley. Occurrence potential is low.
Taraxacum californicum	California dandelion	Endangered/ None	G1G2; S1S2; CNPS: 1B.1	Meadows and seeps. Mesic meadows, usually free of taller vegetation. 1620-2590 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species was absent at the time of survey (June-July 2022; July 2023).
Thamnophis hammondii	two-striped garter snake	None/ None	G4; S3S4; CDFW: SSC	Coastal California from vicinity of Salinas to northwest Baja California. From sea to about 7,000 ft elevation. Highly aquatic, found in or near permanent fresh water. Often along streams with rocky beds and riparian growth.	The aquatic habitats required by this species are absent from the Project Area. Therefore, this species is presumed absent from the Project Area.

Scientific Name	Common Name	Listing Status Federal/ State	Other Status	Habitat	Occurrence Potential
Thelypodium stenopetalum	slender-petaled thelypodium	Endangered/ Endangered	G1; S1; CNPS: 1B.1	Meadows and seeps. Seasonally moist alkaline clay soils; associated with seeps and springs in the pebble plains. 2045-2240 m.	Some of the habitat this species is associated with is present in the Project vicinity. However, this species was absent at the time of survey (June-July 2022; July 2023).
Viola pinetorum ssp. *grisea*	grey-leaved violet	None/ None	G4G5T3; S3; CNPS: 1B.2	Subalpine coniferous forest, upper montane coniferous forest, meadows, and seeps. Dry mountain peaks and slopes. 1580-3700 m.	The only documented occurrence for this species is a 1886 collection from the "historic Bear Valley" area. Occurrence potential is low.

Coding and Terms

E = Endangered T = Threatened C = Candidate FP = Fully Protected SSC = Species of Special Concern R = Rare

State Species of Special Concern: An administrative designation given to vertebrate species that appear to be vulnerable to extinction because of declining populations, limited acreages, and/or continuing threats. Raptor and owls are protected under section 3502.5 of the California Fish and Game code: "It is unlawful to take, possess or destroy any birds in the orders Falconiformes or Strigiformes or to take, possess or destroy the nest or eggs of any such bird."

State Fully Protected: The classification of Fully Protected was the State's initial effort in the 1960's to identify and provide additional protection to those animals that were rare or faced possible extinction. Lists were created for fish, mammals, amphibians and reptiles. Fully Protected species may not be taken or possessed at any time and no licenses or permits may be issued for their take except for collecting these species for necessary scientific research and relocation of the bird species for the protection of livestock.

Global Rankings (Species or Natural Community Level):
G1 = Critically Imperiled – At very high risk of extinction due to extreme rarity (often 5 or fewer populations), very steep declines, or other factors.
G2 = Imperiled – At high risk of extinction due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors.
G3 = Vulnerable – At moderate risk of extinction due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors.
G4 = Apparently Secure – Uncommon but not rare; some cause for long-term concern due to declines or other factors.
G5 = Secure – Common; widespread and abundant.

Subspecies Level: Taxa which are subspecies or varieties receive a taxon rank (T-rank) attached to their G-rank. Where the G-rank reflects the condition of the entire species, the T-rank reflects the global situation of just the subspecies. For example: the Point Reyes mountain beaver, *Aplodontia rufa* ssp. *phaea* is ranked G5T2. The G-rank refers to the whole species range i.e., *Aplodontia rufa.* The T-rank refers only to the global condition of ssp. *phaea*.

State Ranking:
S1 = Critically Imperiled – Critically imperiled in the State because of extreme rarity (often 5 or fewer populations) or because of factor(s) such as very steep declines making it especially vulnerable to extirpation from the State.
S2 = Imperiled – Imperiled in the State because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the State.
S3 = Vulnerable – Vulnerable in the State due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation from the State.
S4 = Apparently Secure – Uncommon but not rare in the State; some cause for long-term concern due to declines or other factors.
S5 = Secure – Common, widespread, and abundant in the State.

California Rare Plant Rankings (CNPS List):
1A = Plants presumed extirpated in California and either rare or extinct elsewhere.
1B = Plants rare, threatened, or endangered in California and elsewhere.
2A = Plants presumed extirpated in California, but common elsewhere.
2B = Plants rare, threatened, or endangered in California, but more common elsewhere.
3 = Plants about which more information is needed; a review list.
4 = Plants of limited distribution; a watch list.

Threat Ranks:
.1 = Seriously threatened in California (over 80% of occurrences threatened / high degree and immediacy of threat)
.2 = Moderately threatened in California (20-80% occurrences threatened / moderate degree and immediacy of threat)
.3 = Not very threatened in California (less than 20% of occurrences threatened / low degree and immediacy of threat or no current threats known)

Appendix C. Plant Species List

List of Plant Species Observed within the Project Area

Scientific Name	Common Name	Life Form
Asteraceae	Aster Family	
Achillea millefolium	common yarrow	perennial herb
Artemisia dracunculus	tarragon	perennial herb
Artemisia ludoviciana	silver wormwood	perennial herb
Artemisia rothrockii	Rothrock sagebrush	shrub
Artemisia tridentata	common sagebrush	shrub
Chrysothamnus viscidiflorus	yellow rabbitbrush	shrub
Ericameria nauseosa	rubber rabbitbrush	shrub
Erigeron divergens	diffuse daisy	biennial or perennial herb
Gnaphalium palustre	lowland cudweed	annual herb
Lactuca serriola	prickly lettuce	annual herb
Symphyotrichum ascendens	western aster	perennial herb
Taraxacum officinale	common dandelion	perennial herb
*Tragopogon dubius**	goat's beard*	perennial herb
Brassicaceae	Mustard Family	
*Chorispora tenella**	crossflower*	annual herb
*Descurainia sophia**	herb sophia*	annual herb
Erysimum capitatum	western wallflower	perennial herb
Lepidium virginicum	Virginia pepperweed	annual herb
*Sisymbrium altissimum**	tumble mustard*	annual herb
Boraginaceae	Forget-Me-Not Family	
Cryptantha sp.	cryptantha	annual herb
Heliotropium curassavicum var. *oculatum*	alkali heliotrope	Perennial herb
Chenopodiaceae	Goosefoot Family	
Atriplex truncata	wedgescale saltweed	annual herb
*Chenopodium chenopodioides**	low goosefoot*	annual herb
*Kochia scoparia***	common red sage**	annual herb
*Salsola tragus***	Russian thistle**	annual herb
Cupressaceae	cypress family	
Juniperus grandis	Sierra juniper	tree
Cyperaceae	Sedge Family	
Carex spp.	sedges	perennial herb

Scientific Name	Common Name	Life Form
Schoenoplectus acutus var. *occidentalis*	tule	perennial herb
Fabaceae	Legume Family	
Astragalus lentiginosus var. *sierrae*	Big Bear Valley milk vetch	perennial herb
Lupinus lepidus var. *confertus*	clustered tidy lupine	perennial herb
Melilotus sp.*	sweetclover*	annual herb
Trifolium sp.	clover	perennial herb
Fagaceae	Beech Family	
Quercus kelloggii	black oak	tree
Geraniaceae	Geranium Family	
Erodium cicutarium	coastal heron's bill	annual herb
Hydrophyllaceae	Waterleaf Family	
Phacelia hastata	white leafed phacelia	perennial herb
Juncaceae	Rush Family	
Juncus spp.	rushes	perennial herb
Malvaceae	Mallow Family	
Malva neglecta	dwarf mallow	annual herb
Sidalcea pedata	bird-foot checkerbloom	perennial herb
Montiaceae	Miner's Lettuce Family	
Calyptridium umbellatum	pussy toes	annual or perennial herb
Onagraceae	Evening Primrose Family	
Epilobium brachycarpum	annual fireweed	annual herb
Oenothera californica	California evening primrose	perennial herb
Orobanchaceae	Broomrape Family	
Castilleja applegatei	wavy leaf paintbrush	perennial herb
Pedicularis semibarbata	pinewoods lousewort	perennial herb
Pinaceae	Pine Family	
Abies concolor	white fir	tree
Pinus jeffreyi	Jeffrey pine	tree
Pinus ponderosa	yellow pine	tree

Scientific Name	Common Name	Life Form
Plantaginaceae	Plantain Family	
Collinsia parviflora	few flowered blue eyed Mary	annual herb
Penstemon caesius	San Bernardino beardtongue	perennial herb
Penstemon labrosus	San Gabriel beardtongue	perennial herb
Penstemon rostriflorus	Bridge's penstemon	perennial herb
Poaceae	Grass Family	
*Bromus tectorum***	cheatgrass**	annual grass
Distichlis spicata	salt grass	perennial grass
Elymus elymoides	squirrel tail grass	perennial grass
Elymus triticoides	beardless wild rye	perennial grass
Hordeum jubatum	fox tail barley	perennial grass
*Poa pratensis***	Kentucky blue grass**	perennial grass
Stipa sp.	grass	perennial grass
Polygonaceae	Buckwheat Family	
Eriogonum baileyi	Bailey's buckwheat	annual herb
Eriogonum davidsonii	Davidson buckwheat	annual herb
Eriogonum wrightii var. *subscaposum*	Wright's buckwheat	perennial herb or shrub
*Rumex crispus**	curly dock*	perennial herb
Rhamnaceae	Buckthorn Family	
Ceanothus cordulatus	mountain whitethorn	shrub
Rosaceae	Rose Family	
Amelanchier utahensis	pale leaved serviceberry	shrub
Cercocarpus ledifolius	desert mountain mahogany	tree or shrub
Horkelia rydbergii	Rydberg's horkelia	perennial herb
Potentilla anserina	silver weed cinquefoil	perennial herb
Potentilla spp.	cinquefoil	perennial herb
Salicaceae	Willow Family	
Salix scouleriana	Scouler willow	tree or shrub
Scrophulariaceae	Figwort Family	
*Verbascum thapsus***	common mullein**	perennial herb

*Nonnative **Invasive, nonnative

Appendix D. Regulatory Framework

Federal Regulations

Clean Water Act

The purpose of the Clean Water Act (CWA) of 1977 is to "restore and maintain the chemical, physical, and biological integrity of the nation's waters." Section 404 of the CWA prohibits the discharge of dredged or fill material into "waters of the United States" (WOTUS) without a permit from the United States Army Corps of Engineers (USACE). The definition of waters of the United States includes rivers, streams, estuaries, territorial seas, ponds, lakes, and wetlands. Wetlands are defined as those areas "that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions" (33 Code of Federal Regulations [CFR] 328.3 7b). The U.S. Environmental Protection Agency (EPA) also has authority over wetlands and may override a USACE permit. Substantial impacts to wetlands may require an individual permit. Projects that only minimally affect wetlands may meet the conditions of one of the existing Nationwide Permits. A Water Quality Certification or waiver pursuant to Section 401 of the CWA is required for Section 404 permit actions; in California this certification or waiver is issued by the Regional Water Quality Control Board (RWQCB).

Federal Endangered Species Act (ESA)

The federal Endangered Species Act (ESA) of 1973 protects plants and wildlife that are listed by the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS) as endangered or threatened. Section 9 of the ESA (USA) prohibits the taking of endangered wildlife, where taking is defined as any effort to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, collect, or attempt to engage in such conduct" (50 CFR 17.3). For plants, this statute governs removing, possessing, maliciously damaging, or destroying any endangered plant on federal land and removing, cutting, digging up, damaging, or destroying any endangered plant on non-federal land in knowing violation of state law (16 United States Code [USC] 1538). Under Section 7 of the ESA, federal agencies are required to consult with the USFWS if their actions, including permit approvals or funding, could adversely affect an endangered species (including plants) or its Critical Habitat. Through consultation and the issuance of a biological opinion, the USFWS may issue an incidental take statement allowing take of the species that is incidental to an otherwise authorized activity, provided the action will not jeopardize the continued existence of the species. The ESA specifies that the USFWS designate habitat for a species at the time of its listing in which are found the physical or biological features "essential to the conservation of the species," or which may require "special Management consideration or protection…" (16 USC § 1533[a][3].2; 16 USC § 1532[a]). This designated Critical Habitat is then afforded the same protection under the ESA as individuals of the species itself, requiring issuance of an Incidental Take Permit prior to any activity that results in "the destruction or adverse modification of habitat determined to be critical" (16 USC § 1536[a][2]).

Interagency Consultation and Biological Assessments

Section 7 of ESA provides a means for authorizing the "take" of threatened or endangered species by federal agencies, and applies to actions that are conducted, permitted, or funded by a federal agency. The statute requires federal agencies to consult with the USFWS or National Marine Fisheries Service (NMFS), as appropriate, to ensure that actions they authorize, fund, or carry out are not likely to jeopardize the continued existence of threatened or endangered species or result in the destruction or adverse modification of Critical Habitat for these species. If a Proposed Project "may affect" a listed species or destroy or modify Critical Habitat, the lead agency is required to prepare a biological assessment evaluating the nature and severity of the potential effect.

Habitat Conservation Plans

Section 10 of the federal ESA requires the acquisition of an Incidental Take Permit (ITP) from the USFWS by non-federal landowners for activities that might incidentally harm (or "take") endangered or threatened wildlife on

their land. To obtain a permit, an applicant must develop a Habitat Conservation Plan that is designed to offset any harmful impacts the proposed activity might have on the species.

Fish and Wildlife Coordination Act

The Fish and Wildlife Coordination Act (16 U.S.C. Sections 661 to 667e et seq.) applies to any federal Project where any body of water is impounded, diverted, deepened, or otherwise modified. Project proponents are required to consult with the USFWS and the appropriate state wildlife agency.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (The Eagle Act) (1940), amended in 1962, was originally implemented for the protection of bald eagles (*Haliaeetus leucocephalus*). In 1962, Congress amended the Eagle Act to cover golden eagles (*Aquila chrysaetos*), a move that was partially an attempt to strengthen protection of bald eagles, since the latter were often killed by people mistaking them for golden eagles. This act makes it illegal to import, export, take (molest or disturb), sell, purchase, or barter any bald eagle or golden eagle or part thereof. The golden eagle, however, is accorded somewhat lighter protection under the Eagle Act than that of the bald eagle.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA) of 1918 implements international treaties between the United States and other nations created to protect migratory birds, any of their parts, eggs, and nests from activities, such as hunting, pursuing, capturing, killing, selling, and shipping, unless expressly authorized in the regulations or by permit. As authorized by the MBTA, the USFWS issues permits to qualified applicants for the following types of activities: falconry, raptor propagation, scientific collecting, special purposes (rehabilitation, education, migratory game bird propagation, and salvage), take of depredating birds, taxidermy, and waterfowl sale and disposal. The regulations governing migratory bird permits can be found in 50 CFR Part 13 General Permit Procedures and 50 CFR part 21 Migratory Bird Permits. The State of California has incorporated the protection of birds of prey in Sections 3800, 3513, and 3503.5 of the California Fish and Game Code (CFGC).

Executive Orders (EO)

> *Invasive Species – EO 13112 (1999)*: Issued on February 3, 1999, promotes the prevention and introduction of invasive species and provides for their control and minimizes the economic, ecological, and human health impacts that invasive species cause through the creation of the Invasive Species Council and Invasive Species Management Plan.
>
> *Migratory Bird – EO 13186 (2001)*: Issued on January 10, 2001, promotes the conservation of migratory birds and their habitats and directs federal agencies to implement the Migratory Bird Treaty Act. Protection and Enhancement of Environmental Quality – EO 11514 (1970a), issued on March 5, 1970, supports the purpose and policies of the National Environmental Policy Act (NEPA) and directs federal agencies to take measures to meet national environmental goals.

Migratory Bird Treaty Reform Act

The Migratory Bird Treaty Reform Act (Division E, Title I, Section 143 of the Consolidated Appropriations Act, 2005, PL 108–447) amends the Migratory Bird Treaty Act (16 U.S.C. Sections 703 to 712) such that nonnative birds or birds that have been introduced by humans to the United States or its territories are excluded from protection under the Act. It defines a native migratory bird as a species present in the United States and its territories as a result of natural biological or ecological processes. This list excluded two additional species commonly observed in the United States, the rock pigeon (*Columba livia*) and domestic goose (*Anser domesticus*).

Birds of Conservation Concern

Birds of Conservation Concern (BCC) is a USFWS list of bird species identified to have the highest conservation priority, and with the potential for becoming candidates for listing as federally threatened or endangered. The chief legal authority for BCC is the Fish and Wildlife Conservation Act of 1980 (FWCA). Other authorities include the FESA, the Fish and Wildlife Act of 1956, and the Department of the Interior U.S Code (16 U.S.C. § 701). The 1988 amendment to the FWCA (Public Law 100-653, Title VIII) requires the Secretary of the Interior, through the USFWS, to "identify species, subspecies, and populations of all migratory nongame birds that, without additional conservation actions, are likely to become candidates for listing under the Endangered Species Act of 1973" (USFWS, 2008a).

State Regulations

California Fish and Game Code Sections 1600 through 1607 of the CFGC

This section requires that a Streambed Alteration Application be submitted to the CDFW for "any activity that may substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake." The CDFW reviews the proposed actions and, if necessary, submits to the applicant a proposal for measures to protect affected fish and wildlife resources. The final proposal that is mutually agreed upon by the Department and the applicant is the Streambed Alteration Agreement. Often, Projects that require a Streambed Alteration Agreement also require a permit from the USACE under Section 404 of the CWA. In these instances, the conditions of the Section 404 permit and the Streambed Alteration Agreement may overlap.

California Porter-Cologne Water Quality Control Act

The Porter-Cologne Act is the principal law governing water quality in California. It establishes a comprehensive program to protect water quality and the beneficial uses of water. Unlike the federal CWA, Porter-Cologne applies to both surface water and ground water. Porter-Cologne designated the State Water Resources Control Board (State Board) as the statewide water quality planning agency, and also gave authority to the RWQCB. Beyond establishment of a state framework, this act has been revised to comply with the federal CWA.

The State Board is responsible for developing statewide water quality plans (e.g., Ocean Plan, Inland Surface Waters Plan), while the RWQCB is responsible for developing Regional Water Quality Plans (basin plans). The basin plans in turn are approved by the State Board and EPA. Amendments to basin plans, such as Total Maximum Daily Loads (TMDLs), must also be approved by the Office of Administrative Law. These plans, both statewide and basin, include the identification of beneficial uses, water quality objectives, and implementation plans. The RWQCB has the primary responsibility for implementing the provisions in both statewide and basin plans.

California Endangered Species Act

The California Endangered Species Act (CESA) (Sections 2050 to 2085) establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats by protecting "all native species of fishes, amphibians, reptiles, birds, mammals, invertebrates, and plants, and their habitats, threatened with extinction and those experiencing a significant decline which, if not halted, would lead to a threatened or endangered designation." Animal species are listed by the CDFW as threatened or endangered, and plants are listed as rare, threatened, or endangered. However, only those plant species listed as threatened or endangered receive protection under the California ESA.

CESA mandates that state agencies do not approve a Project that would jeopardize the continued existence of these species if reasonable and prudent alternatives are available that would avoid a jeopardy finding. There are no state agency consultation procedures under the California ESA. For Projects that would affect a species that is federally and state listed, compliance with ESA satisfies the California ESA if the California Department of Fish and Wildlife (CDFW) determines that the federal incidental take authorization is consistent with the CESA under Section 2080.1. For Projects that would result in take of a species that is state listed only, the Project sponsor must apply for a take permit, in accordance with Section 2081(b).

Fully Protected Species

Four sections of the California Fish and Game Code (CFGC) list 37 fully protected species (CFGC Sections 3511, 4700, 5050, and 5515). These sections prohibit take or possession "at any time" of the species listed, with few exceptions, and state that "no provision of this code or any other law will be construed to authorize the issuance of permits or licenses to 'take' the species," and that no previously issued permits or licenses for take of the species "shall have any force or effect" for authorizing take or possession.

Bird Nesting Protections

Bird nesting protections (Sections 3503, 3503.5, 3511, 3513 and 3800) in the CFGC include the following:

- Section 3503 prohibits the take, possession, or needless destruction of the nest or eggs of any bird.
- Section 3503.5 prohibits the take, possession, or needless destruction of any nests, eggs, or birds in the orders Falconiformes (new world vultures, hawks, eagles, ospreys, and falcons, among others), and Strigiformes (owls).
- Section 3511 prohibits the take or possession of Fully protected birds.
- Section 3513 prohibits the take or possession of any migratory nongame bird or part thereof, as designated in the MBTA. To avoid violation of the take provisions, it is generally required that Project-related disturbance at active nesting territories be reduced or eliminated during the nesting cycle.

Section 3800 prohibits the take of any non-game bird (i.e., bird that is naturally occurring in California that is not a gamebird, migratory game bird, or fully protected bird).

Native Plant Protection Act

The Native Plant Protect Act (NPPA) (1977) (CFGC Sections 1900-1913) was created with the intent to "preserve, protect, and enhance rare and endangered plants in this State." The NPPA is administered by CDFW. The Fish and Game Commission has the authority to designate native plants as endangered or rare and to

protect endangered and rare plants from take. CESA (CFGC 2050-2116) provided further protection for rare and endangered plant species, but the NPPA remains part of the Fish and Game Code.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino National Forest Area, California
Survey Area Data: Version 14, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 27, 2021—May 27, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Map Unit Legend

Map Unit Symbol	Map Unit Name	Acres in AOI	Percent of AOI
132	Aquents-Grunney complex, 0 to 4 percent slopes	296.8	4.1%

Appendix F. USFWS IPaC, CNDDB, & CNPS Species Lists

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

San Bernardino County, California

2177 Salk Avenue Suite 250
Carlsbad, CA 92008-7385

NOT FOR CONSULTATION

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

---

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information. IPaC only shows species that are regulated by USFWS (see FAQ).

NOT FOR CONSULTATION

2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Birds

NAME	STATUS
California Spotted Owl Strix occidentalis occidentalis No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/7266	Proposed Endangered
Southwestern Willow Flycatcher Empidonax traillii extimus Wherever found There is **final** critical habitat for this species. Your location does not overlap the critical habitat. https://ecos.fws.gov/ecp/species/6749	Endangered

Reptiles

Bald & Golden Eagles

Bald and golden eagles are protected under the Bald and Golden Eagle Protection Act and the Migratory Bird Treaty Act.

Any person or organization who plans or conducts activities that may result in impacts to bald or golden eagles, or their habitats, should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

Additional information can be found using the following links:

- Eagle Managment https://www.fws.gov/program/eagle-management
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

There are bald and/or golden eagles in your project area.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list,click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON

Bald Eagle Haliaeetus leucocephalus — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31

This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the

NOT FOR CONSULTATION

probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

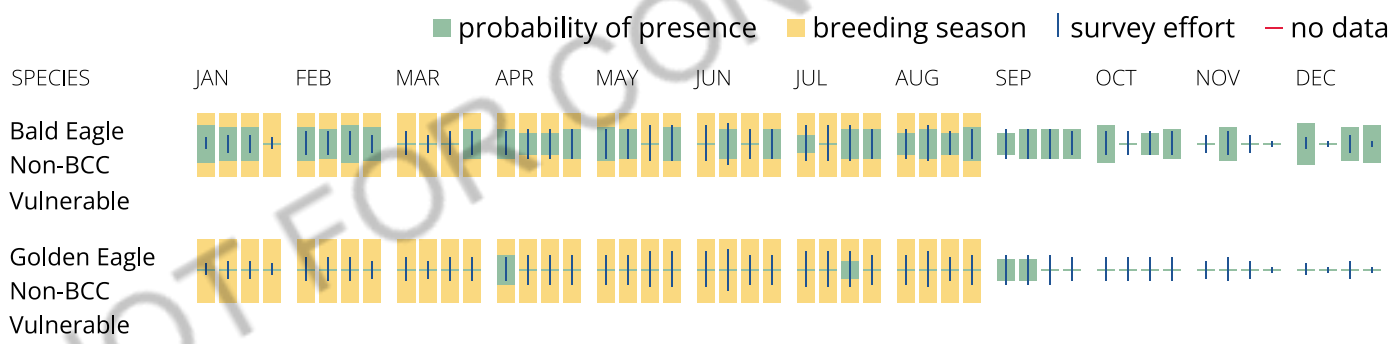
Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION

What does IPaC use to generate the potential presence of bald and golden eagles in my specified location?

The potential for eagle presence is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply). To see a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs of bald and golden eagles in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur. Please contact your local Fish and Wildlife Service Field Office if you have questions.

NOT FOR CONSULTATION

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern https://www.fws.gov/program/migratory-birds/species
- Measures for avoiding and minimizing impacts to birds https://www.fws.gov/library/collections/avoiding-and-minimizing-incidental-take-migratory-birds
- Nationwide conservation measures for birds https://www.fws.gov/sites/default/files/documents/nationwide-standard-conservation-measures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date

range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NAME	BREEDING SEASON
Allen's Hummingbird *Selasphorus sasin* This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9637	Breeds Feb 1 to Jul 15
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.	Breeds Jan 1 to Aug 31

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and

understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (▪)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)

Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

Survey Effort (|)

Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

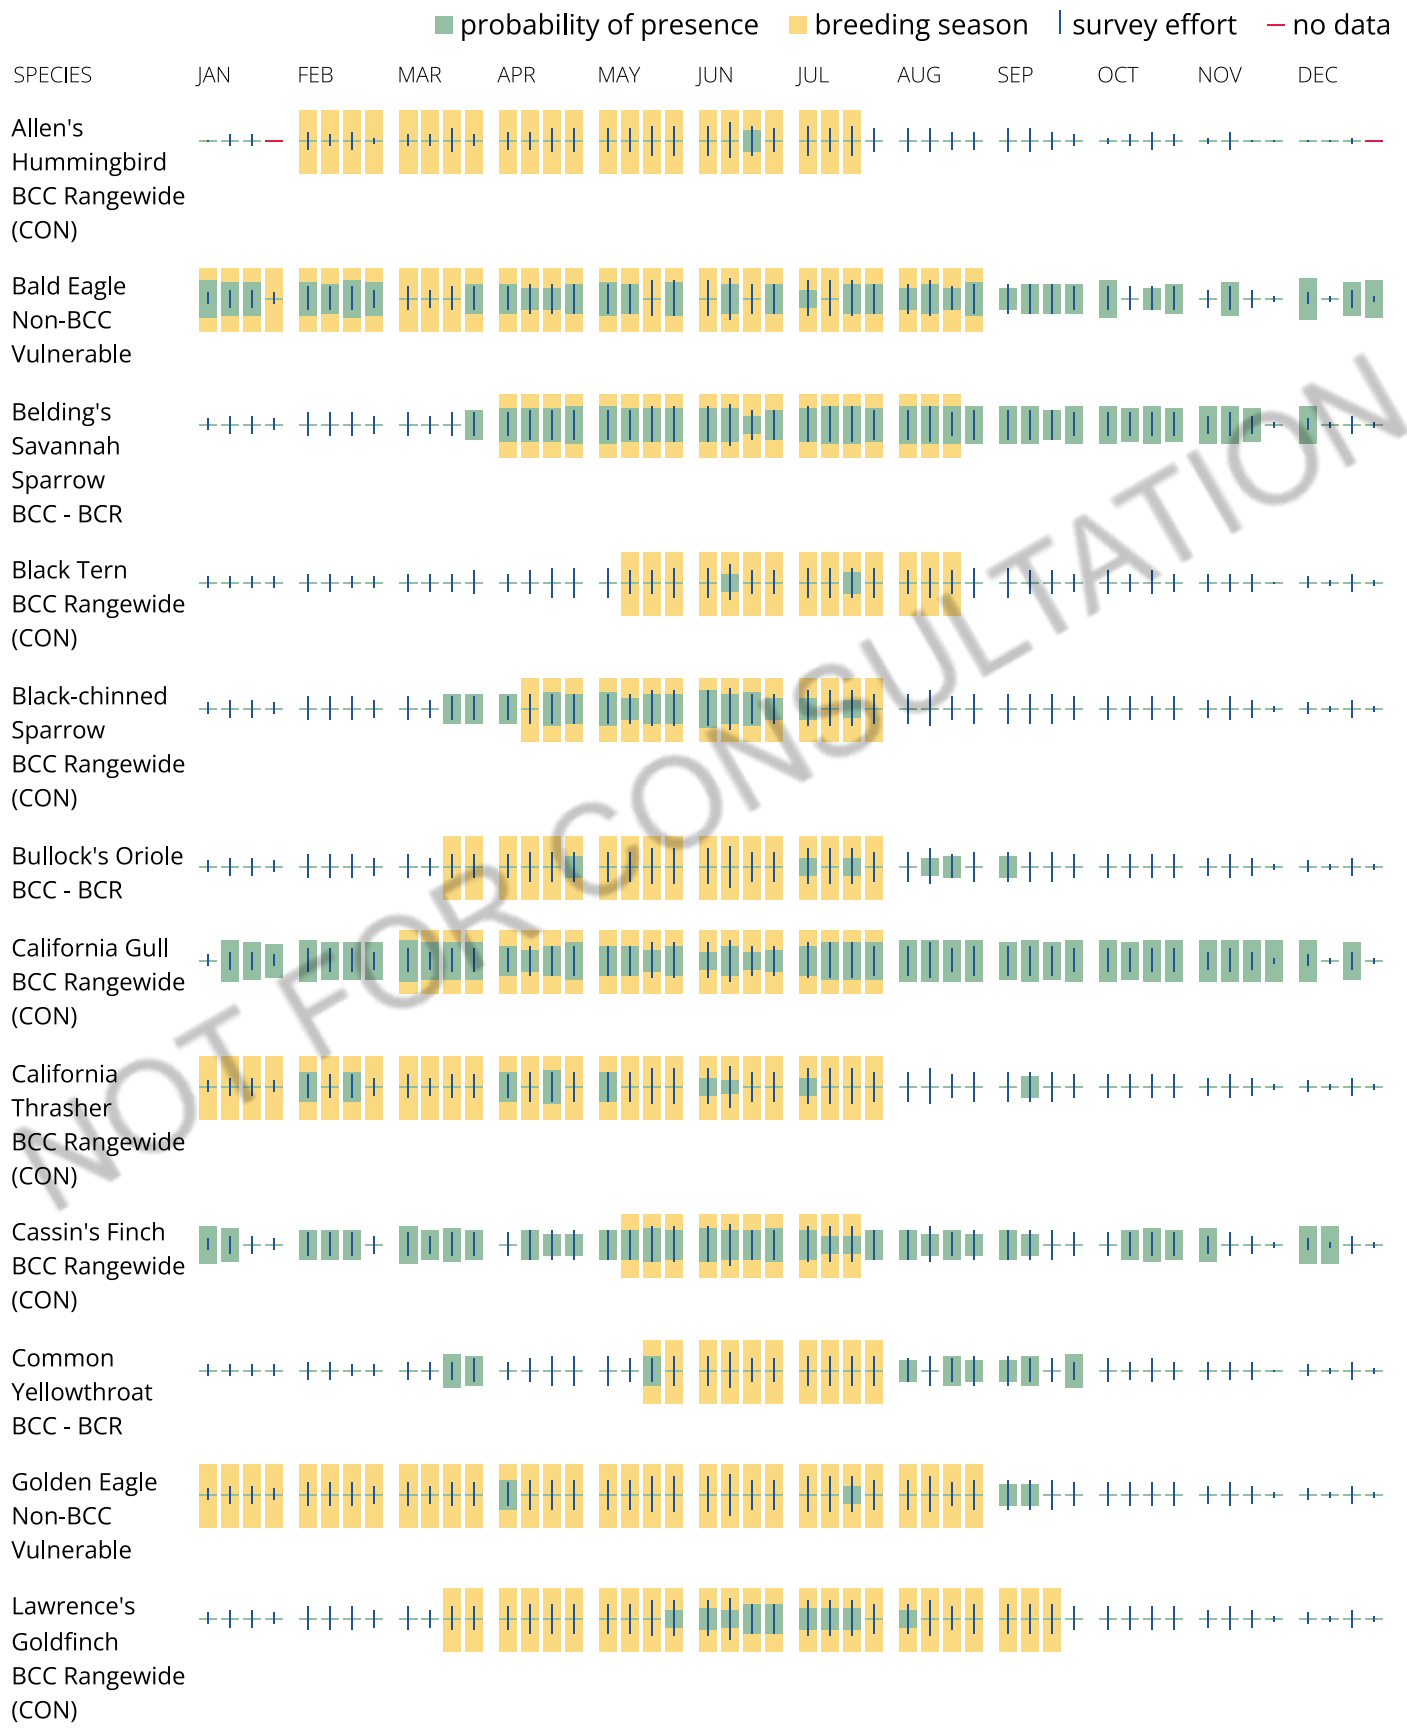
No Data (–)

A week is marked as having no data if there were no survey events for that week.

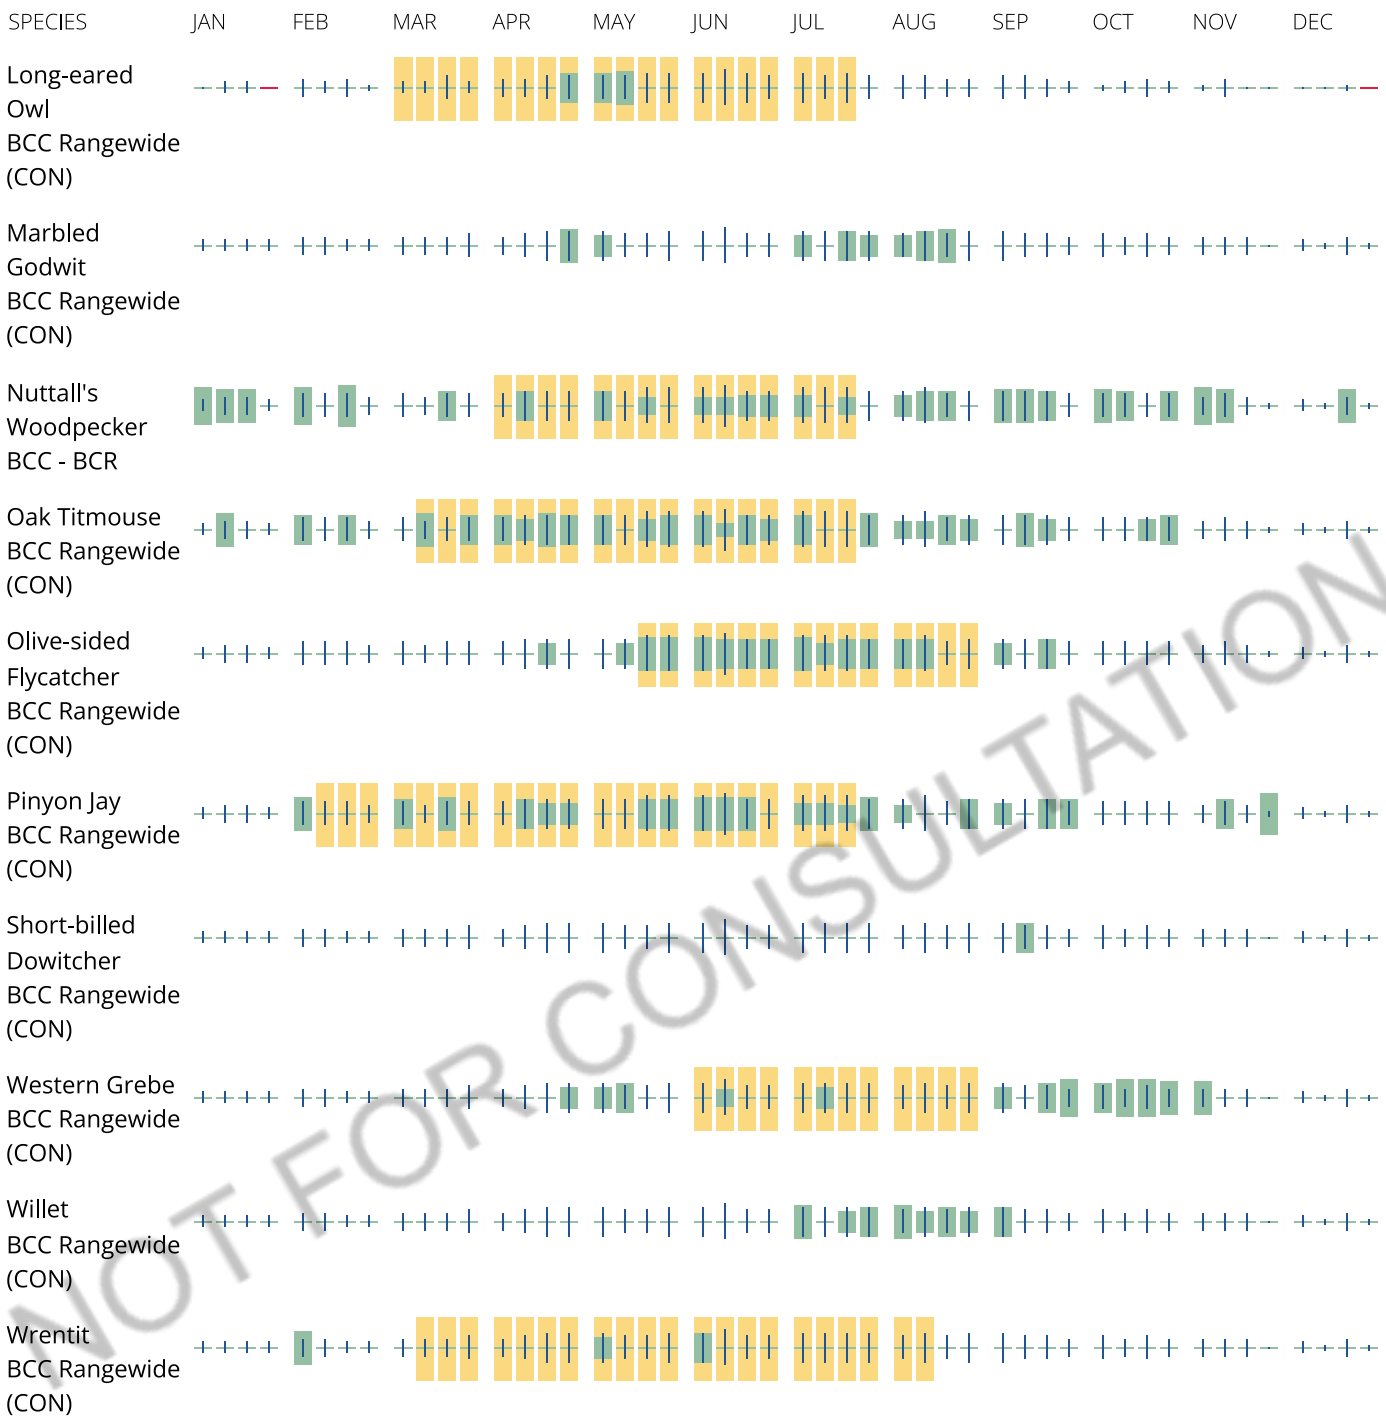
Survey Timeframe

NOT FOR CONSULTATION

Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



NOT FOR CONSULTATION



NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the list of migratory birds that potentially occur in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the Rapid Avian Information Locator (RAIL) Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets.

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering or migrating in my area?

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may query your location using the RAIL Tool and look at the range maps provided for birds in your area at the bottom of the profiles provided for each bird in your results. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

NOT FOR CONSULTATION

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ "What does IPaC use to generate the migratory birds potentially occurring in my specified location". Please be aware this report provides the "probability of presence" of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the "no data" indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

NOTE: This initial screening does **not** replace an on-site delineation to determine whether wetlands occur. Additional information on the NWI data is provided below.

NOT FOR CONSULTATION

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate Federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

▲ SCIENTIFIC NAME	COMMON NAME	FAMILY	LIFEFORM	FED LIST	STATE LIST	GLOBAL RANK	STATE RANK	CA RARE PLANT RANK	GENERAL HABITATS	MICROHABITATS
Abronia nana var. *covillei*	Coville's dwarf abronia	Nyctaginaceae	perennial herb	None	None	G4T3	S3	4.2	Great Basin scrub, Joshua tree "woodland", Pinyon and juniper woodland, Subalpine coniferous forest, Upper montane coniferous forest	Carbonate, Sandy
Acanthoscyphus parishii var. *cienegensis*	Cienega Seca oxytheca	Polygonaceae	annual herb	None	None	G4?T2	S2	1B.3	Joshua tree "woodland", Pinyon and juniper woodland, Upper montane coniferous forest (granitic, sandy)	
Acanthoscyphus parishii var. *goodmaniana*	Cushenbury oxytheca	Polygonaceae	annual herb	FE	None	G4?T1	S1	1B.1	Pinyon and juniper woodland (carbonate, talus)	Carbonate, Sandy
Acanthoscyphus parishii var. *parishii*	Parish's oxytheca	Polygonaceae	annual herb	None	None	G4? T3T4	S3S4	4.2	Chaparral, Lower montane coniferous forest	Gravelly (sometimes), Sandy (sometimes)
Antennaria marginata	white-margined everlasting	Asteraceae	perennial stoloniferous herb	None	None	G4G5	S1	2B.3	Lower montane coniferous forest, Upper montane coniferous forest	
Arenaria lanuginosa var. *saxosa*	rock sandwort	Caryophyllaceae	perennial herb	None	None	G5T5	S2	2B.3	Subalpine coniferous forest, Upper montane coniferous forest	Mesic, Sandy
Astragalus albens	Cushenbury milk-vetch	Fabaceae	perennial herb	FE	None	G1	S1	1B.1	Joshua tree "woodland", Mojavean desert scrub, Pinyon and juniper woodland	Carbonate (usually), Granitic (rarely)

Astragalus bernardinus	San Bernardino milk-vetch	Fabaceae	perennial herb	None	None	G3	S3	1B.2	Joshua tree "woodland", Pinyon and juniper woodland	Carbonate (often), Granitic (often)
Astragalus bicristatus	crested milk-vetch	Fabaceae	perennial herb	None	None	G3	S3	4.3	Lower montane coniferous forest, Upper montane coniferous forest	Carbonate (usually), Rocky (sometimes), Sandy (sometimes)
Astragalus lentiginosus var. *sierrae*	Big Bear Valley milk-vetch	Fabaceae	perennial herb	None	None	G5T2	S2	1B.2	Meadows and seeps, Mojavean desert scrub, Pinyon and juniper woodland, Upper montane coniferous forest	Gravelly (sometimes), Rocky (sometimes)
Astragalus leucolobus	Big Bear Valley woollypod	Fabaceae	perennial herb	None	None	G2	S2	1B.2	Lower montane coniferous forest, Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest	Rocky
Boechera dispar	pinyon rockcress	Brassicaceae	perennial herb	None	None	G3	S3	2B.3	Joshua tree "woodland", Mojavean desert scrub, Pinyon and juniper woodland	Granitic, Gravelly
Boechera lincolnensis	Lincoln rockcress	Brassicaceae	perennial herb	None	None	G4G5	S3	2B.3	Chenopod scrub, Mojavean desert scrub	Carbonate
Boechera parishii	Parish's rockcress	Brassicaceae	perennial herb	None	None	G2	S2	1B.2	Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest	Carbonate (sometimes), Rocky
Boechera shockleyi	Shockley's rockcress	Brassicaceae	perennial herb	None	None	G3	S2	2B.2	Pinyon and juniper woodland (carbonate, gravelly, quartzite, rocky)	

Botrychium crenulatum	scalloped moonwort	Ophioglossaceae	perennial rhizomatous herb	None	None	G4	S3	2B.2	Bogs and fens, Lower montane coniferous forest, Marshes and swamps (freshwater), Meadows and seeps, Upper montane coniferous forest	
Calochortus palmeri var. palmeri	Palmer's mariposa-lily	Liliaceae	perennial bulbiferous herb	None	None	G3T2	S2	1B.2	Chaparral, Lower montane coniferous forest, Meadows and seeps	Mesic
Calyptridium pygmaeum	pygmy pussypaws	Montiaceae	annual herb	None	None	G1G2	S1S2	1B.2	Subalpine coniferous forest, Upper montane coniferous forest	Gravelly (sometimes), Sandy (sometimes)
Carex occidentalis	western sedge	Cyperaceae	perennial rhizomatous herb	None	None	G4	S3	2B.3	Lower montane coniferous forest, Meadows and seeps	
Castilleja cinerea	ash-gray paintbrush	Orobanchaceae	perennial herb (hemiparasitic)	FT	None	G1G2	S1S2	1B.2	Meadows and seeps, Mojavean desert scrub, Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest (clay, openings)	
Castilleja lasiorhyncha	San Bernardino Mountains owl's-clover	Orobanchaceae	annual herb (hemiparasitic)	None	None	G2?	S2?	1B.2	Chaparral, Meadows and seeps, Pebble (Pavement) plain, Riparian woodland, Upper montane coniferous forest	Mesic
Castilleja montigena	Heckard's paintbrush	Orobanchaceae	perennial herb (hemiparasitic)	None	None	G3	S3	4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest	

Castilleja plagiotoma	Mojave paintbrush	Orobanchaceae	perennial herb (hemiparasitic)	None	None	G4	S4	4.3	Great Basin scrub (alluvial), Joshua tree "woodland", Lower montane coniferous forest, Pinyon and juniper woodland	
Cleomella brevipes	short-pedicelled cleomella	Cleomaceae	annual herb	None	None	G4	S3	4.2	Marshes and swamps, Meadows and seeps, Playas	Alkaline
Cordylanthus eremicus ssp. *eremicus*	desert bird's-beak	Orobanchaceae	annual herb (hemiparasitic)	None	None	G3T3	S3	4.3	Joshua tree "woodland", Mojavean desert scrub, Pinyon and juniper woodland	
Delphinium parryi ssp. *purpureum*	Mt. Pinos larkspur	Ranunculaceae	perennial herb	None	None	G4T4	S4	4.3	Chaparral, Mojavean desert scrub, Pinyon and juniper woodland	
Diplacus johnstonii	Johnston's monkeyflower	Phrymaceae	annual herb	None	None	G4	S4	4.3	Lower montane coniferous forest (disturbed areas, gravelly, roadsides, rocky, scree)	
Drymocallis cuneifolia var. *cuneifolia*	wedgeleaf woodbeauty	Rosaceae	perennial herb	None	None	G2T1	S1	1B.1	Riparian scrub, Upper montane coniferous forest	Carbonate (sometimes)
Dudleya abramsii ssp. *affinis*	San Bernardino Mountains dudleya	Crassulaceae	perennial herb	None	None	G4T2	S2	1B.2	Pebble (Pavement) plain, Pinyon and juniper woodland, Upper montane coniferous forest	Carbonate (sometimes), Granitic (sometimes)
Eremogone ursina	Big Bear Valley sandwort	Caryophyllaceae	perennial herb	FT	None	G1	S1	1B.2	Meadows and seeps, Pebble (Pavement) plain, Pinyon and juniper woodland	Mesic, Rocky
Erigeron parishii	Parish's daisy	Asteraceae	perennial herb	FT	None	G2	S2	1B.1	Mojavean desert scrub, Pinyon and juniper woodland	Carbonate (usually), Granitic (sometimes)
Eriogonum evanidum	vanishing wild buckwheat	Polygonaceae	annual herb	None	None	G2	S1	1B.1	Chaparral, Cismontane woodland, Lower montane coniferous forest, Pinyon and juniper woodland	Gravelly (sometimes), Sandy (sometimes)

Eriogonum kennedyi var. *austromontanum*	southern mountain buckwheat	Polygonaceae	perennial herb	FT	None	G4T2	S2	1B.2	Lower montane coniferous forest (gravelly), Pebble (Pavement) plain	
Eriogonum microthecum var. *johnstonii*	Johnston's buckwheat	Polygonaceae	perennial deciduous shrub	None	None	G5T2	S2	1B.3	Subalpine coniferous forest, Upper montane coniferous forest	Rocky
Eriogonum ovalifolium var. *vineum*	Cushenbury buckwheat	Polygonaceae	perennial herb	FE	None	G5T1	S1	1B.1	Joshua tree "woodland", Mojavean desert scrub, Pinyon and juniper woodland	Carbonate
Eriogonum umbellatum var. *minus*	alpine sulfur-flowered buckwheat	Polygonaceae	perennial herb	None	None	G5T4	S4	4.3	Subalpine coniferous forest, Upper montane coniferous forest	Gravelly
Eriophyllum lanatum var. *obovatum*	southern Sierra woolly sunflower	Asteraceae	perennial herb	None	None	G5T4	S4	4.3	Lower montane coniferous forest, Upper montane coniferous forest	Loam, Sandy
Erythranthe exigua	San Bernardino Mountains monkeyflower	Phrymaceae	annual herb	None	None	G2	S2	1B.2	Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest	Clay, Mesic
Erythranthe purpurea	little purple monkeyflower	Phrymaceae	annual herb	None	None	G2	S2	1B.2	Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest	
Frasera neglecta	pine green-gentian	Gentianaceae	perennial herb	None	None	G4	S4	4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest	
Fritillaria pinetorum	pine fritillary	Liliaceae	perennial bulbiferous herb	None	None	G4	S4	4.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland, Subalpine coniferous forest, Upper montane coniferous forest	Granitic (sometimes), Metamorphic (sometimes)
Galium angustifolium ssp. *gabrielense*	San Antonio Canyon bedstraw	Rubiaceae	perennial herb	None	None	G5T3	S3	4.3	Chaparral, Lower montane coniferous forest	Granitic, Rocky (sometimes), Sandy (sometimes)

Galium jepsonii	Jepson's bedstraw	Rubiaceae	perennial rhizomatous herb	None	None	G3	S3	4.3	Lower montane coniferous forest, Upper montane coniferous forest	Granitic, Gravelly (sometimes), Rocky (sometimes)
Galium johnstonii	Johnston's bedstraw	Rubiaceae	perennial herb	None	None	G4	S4	4.3	Chaparral, Lower montane coniferous forest, Pinyon and juniper woodland, Riparian woodland	
Gilia leptantha ssp. *leptantha*	San Bernardino gilia	Polemoniaceae	annual herb	None	None	G4T2	S2	1B.3	Lower montane coniferous forest (gravelly, sandy)	
Gilia leptantha ssp. *pinetorum*	pine gilia	Polemoniaceae	annual herb	None	None	G4T4	S4	4.3	Lower montane coniferous forest (rocky, sandy)	
Heuchera caespitosa	urn-flowered alumroot	Saxifragaceae	perennial rhizomatous herb	None	None	G3	S3	4.3	Cismontane woodland, Lower montane coniferous forest, Riparian forest (montane), Upper montane coniferous forest	Rocky
Heuchera parishii	Parish's alumroot	Saxifragaceae	perennial rhizomatous herb	None	None	G3	S3	1B.3	Alpine boulder and rock field, Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest	Carbonate (sometimes), Rocky
Horkelia wilderae	Barton Flats horkelia	Rosaceae	perennial herb	None	None	G1	S1	1B.1	Chaparral (edges), Lower montane coniferous forest, Upper montane coniferous forest	
Hulsea vestita ssp. *parryi*	Parry's sunflower	Asteraceae	perennial herb	None	None	G5T4	S4	4.3	Lower montane coniferous forest, Pinyon and juniper woodland, Upper montane coniferous forest	Carbonate (sometimes), Granitic (sometimes), Openings, Rocky
Ivesia argyrocoma var. *argyrocoma*	silver-haired ivesia	Rosaceae	perennial herb	None	None	G2T2	S2	1B.2	Meadows and seeps (alkaline), Pebble (Pavement) plain, Upper montane coniferous forest	

Juncus duranii	Duran's rush	Juncaceae	perennial rhizomatous herb	None	None	G3	S3	4.3	Lower montane coniferous forest, Meadows and seeps, Upper montane coniferous forest	Mesic
Lewisia brachycalyx	short-sepaled lewisia	Montiaceae	perennial herb	None	None	G4	S2	2B.2	Lower montane coniferous forest, Meadows and seeps	Mesic
Lilium parryi	lemon lily	Liliaceae	perennial bulbiferous herb	None	None	G3	S3	1B.2	Lower montane coniferous forest, Meadows and seeps, Riparian forest, Upper montane coniferous forest	Mesic
Linanthus killipii	Baldwin Lake linanthus	Polemoniaceae	annual herb	None	None	G1	S1	1B.2	Joshua tree "woodland", Meadows and seeps (alkaline), Pebble (Pavement) plain, Pinyon and juniper woodland	
Malaxis monophyllos var. *brachypoda*	white bog adder's-mouth	Orchidaceae	perennial bulbiferous herb	None	None	G5T4T5	S1	2B.1	Bogs and fens, Meadows and seeps, Upper montane coniferous forest	Mesic
Muilla coronata	crowned muilla	Themidaceae	perennial bulbiferous herb	None	None	G3	S3	4.2	Chenopod scrub, Joshua tree "woodland", Mojavean desert scrub, Pinyon and juniper woodland	
Navarretia peninsularis	Baja navarretia	Polemoniaceae	annual herb	None	None	G3	S2	1B.2	Chaparral (openings), Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland	Mesic
Oreonana vestita	woolly mountain-parsley	Apiaceae	perennial herb	None	None	G3	S3	1B.3	Lower montane coniferous forest, Subalpine coniferous forest, Upper montane coniferous forest	Gravelly (sometimes), Talus (sometimes)

Packera bernardina	San Bernardino ragwort	Asteraceae	perennial herb	None	None	G2	S2	1B.2	Meadows and seeps (mesic, sometimes alkaline), Pebble (Pavement) plain, Upper montane coniferous forest	
Packera ionophylla	Tehachapi ragwort	Asteraceae	perennial herb	None	None	G4	S4	4.3	Lower montane coniferous forest, Upper montane coniferous forest	Granitic, Rocky
Perideridia parishii ssp. *parishii*	Parish's yampah	Apiaceae	perennial herb	None	None	G4T3T4	S2	2B.2	Lower montane coniferous forest, Meadows and seeps, Upper montane coniferous forest	
Phacelia exilis	Transverse Range phacelia	Hydrophyllaceae	annual herb	None	None	G4Q	S4	4.3	Lower montane coniferous forest, Meadows and seeps, Pebble (Pavement) plain, Upper montane coniferous forest	Gravelly (sometimes), Sandy (sometimes)
Phacelia mohavensis	Mojave phacelia	Hydrophyllaceae	annual herb	None	None	G4Q	S4	4.3	Cismontane woodland, Lower montane coniferous forest, Meadows and seeps, Pinyon and juniper woodland	Gravelly (sometimes), Sandy (sometimes)
Phlox dolichantha	Big Bear Valley phlox	Polemoniaceae	perennial herb	None	None	G2	S2	1B.2	Pebble (Pavement) plain, Upper montane coniferous forest (openings)	
Physaria kingii ssp. *bernardina*	San Bernardino Mountains bladderpod	Brassicaceae	perennial herb	FE	None	G5T1	S1	1B.1	Lower montane coniferous forest, Pinyon and juniper woodland, Subalpine coniferous forest	Carbonate (usually)

USGS Quadrangle: Big Bear City and Moonridge, Calif., 7.5' quadrangles (Sections 11-15 and 26, T2N R1E, and Sections 7 and 18, T2N R2E, San Bernardino Baseline and Meridian)

Project Size: Approximately 110.5 acres and 9.6 linear miles

Keywords: San Bernardino Mountains; Phase I historical/archaeological resources survey; Site 36-002060 (lithic scatter): no longer extant in the APE; Site 36-015027 (Baldwin Lake; California Point of Historical Interest No. SBr-014): no adverse effect; Big Bear Area Regional Wastewater Agency wastewater treatment plant (temporarily designated Site 3969-1H) and 14 previously recorded historic-era roads: not "historic properties" or "historical resources"

EXECUTIVE SUMMARY

Between November 2022 and August 2023, at the request of Tom Dodson & Associates, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the Replenish Big Bear Program DEIR, a multi-component series of wastewater improvements in and near the unincorporated communities of Big Bear City and Moonridge, in the Big Bear Valley area of San Bernardino County, California. The program will expand and improve discharge areas and groundwater recharge capabilities, install monitoring wells and pump stations, and implement other upgrades. The APE encompasses a total of approximately 110.5 acres and 9.6 linear miles of pipeline alignment located mostly within existing road rights-of-ways. The vertical extent of the APE is anticipated to range between 4.5 and 6.0 feet below surface for the pipelines and upgrades and between 250 to 750 feet below surface for the monitoring wells. The entire APE lies within portions of Sections 11-15 and 26, T2N R1E, and Sections 7 and 18, T2N R2E, San Bernardino Baseline and Meridian.

The study is a part of the environmental review process for the undertaking, as required by the lead agencies, namely the Big Bear Area Regional Wastewater Agency (BBARWA) under the California Environmental Quality Act (CEQA) and the State Water Resources Control Board (SWRCB) under Section 106 of the National Historic Preservation Act (NHPA). The purpose of the study is to provide the BBARWA and the SWRCB with the necessary information and analysis to determine whether the undertaking would have an adverse effect on any "historic properties," as defined by 36 CFR 800.16(l), or "historical resources," as defined by Calif. PRC §5020.1(j), that may exist in or near the APE. In order to accomplish this objective, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, consulted with Native American representatives, and carried out a systematic field survey.

As a result of these research procedures, 16 previously recorded historical/archaeological sites and 1 previously undocumented site were identified as lying within or partially within in the APE, as listed below:

Primary No.	Other Designation	Description
36-002060	CA-SBR-2060	Prehistoric lithic scatter
36-015027	CPHI No. SBr-014	Baldwin Lake
36-024007	CA-SBR-15192H	Division Drive
36-024051	CA-SBR-15236H	Bufflehead Drive
36-024052	CA-SBR-15237H	Teal Drive
36-024053	CA-SBR-15238H	Gold Mountain Drive
36-024054	CA-SBR-15239H	Mount Doble Drive
36-024059	CA-SBR-15244H	Arbor Lane
36-024547	CA-SBR-15588H	Shore Drive
36-024556	CA-SBR-15597H	Gildart Drive
36-024557	CA-SBR-15598H	Rose Hill Drive
36-024558	CA-SBR-15599H	Saw Mill Drive
36-024559	CA-SBR-15600H	Pinon Drive
36-024560	CA-SBR-15601H	Big Tree Drive
36-024562	CA-SBR-15603H	Pine View Drive
36-024563	CA-SBR-15604H	Holcomb View Drive
Pending	3969-1H*	BBARWA wastewater treatment plant

* Temporary designation, pending assignment of permanent identification number

Of these 17 cultural resources, 1 is prehistoric (i.e., Native American) in origin, 15 dates to the historic period, and 1 is a natural feature that acquired cultural significance in both prehistory and history, namely Baldwin Lake. The 15 historic-period sites include 14 roads that remain in use and the circa 1966 BBARWA wastewater treatment plant, which also remains operational. None of these 15 sites appear to be eligible for listing in the National Register of Historic Places or the California Register of Historical Resources. Therefore, they do not meet the statutory definitions of "historic properties" or "historical resources."

The prehistoric site, 36-002060, was first recorded in 1969 as a lithic scatter near the intersection of Shay Road and Palomino Drive, in an area that has since been developed into residential properties. The portion of the APE across the site lies entirely within the public right-of-way along Palomino Drive, where no remnants of the site were observed during this study. In light of the extensive ground disturbance that occurred at this location during road construction and underground utility installation, it is highly unlikely for any archaeological features or artifact deposits associated with the site to survive intact below the ground surface. As a result, this study concludes that Site 36-002060 no longer exists within the APE.

Baldwin Lake (36-015027) was designated a California Point of Historical Interest (No. SBr-014) in 1973 due to its well-known association with colorful events in early California history and thus inherently qualifies as a "historical resource" under CEQA. Because of the same historical association, and because of its prominent role in local Native American creation story, Baldwin Lake may be considered eligible for the National Register of Historic Places upon full evaluation and thereby qualify as a "historic property" under Section 106 provisions as well. However, since the APE overlaps only a small portion of the lakebed at the BBARWA wastewater treatment plant and along the Palomino Drive and Baldwin Lake Trail rights-of-way, a full evaluation of the historical significance of Baldwin Lake is well beyond the scope of this study.

Given the limited involvement of the lakebed in the project plans and the previously altered cultural landscape in this portion of the APE, the proposed undertaking has little potential to affect the existing characteristics of Baldwin Lake. Based on these considerations, the present study concludes that Baldwin Lake as a whole may be presumed to be a "historic property" for the purpose of this undertaking, with the understanding that the limited impact the undertaking may bring about to the current condition of the APE will not constitute an adverse effect on this "historic property"/"historical resource."

In summary, among the 17 cultural resources identified in the APE, the 15 historic-period sites do not appear to qualify as "historic properties" or "historical resources," the prehistoric site (36-002060) is no longer extant within the APE boundaries, and the undertaking will not have an adverse effect on Baldwin Lake, a "historical resource" under CEQA and a presumed "historic property" under Section 106. Meanwhile, the subsurface sediments in the vertical APE appear to be relatively low in sensitivity for potentially significant archaeological deposits of prehistoric origin.

Pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH recommends to the SWRCB and the BBARWA a conclusion that the undertaking will not adversely affect any "historic properties" or "historical resources." No further cultural resources investigation is recommended for the undertaking unless project plans undergo such changes as to include areas not covered by this study. However, if buried cultural materials are encountered during any earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the finds.

INTRODUCTION

Between November 2022 and August 2023, at the request of Tom Dodson & Associates, CRM TECH performed a cultural resources study on the Area of Potential Effects (APE) for the Replenish Big Bear Program DEIR, a multi-component series of wastewater improvements in and near the unincorporated communities of Big Bear City and Moonridge, in the Big Bear Valley area of San Bernardino County, California. The program will expand and improve discharge areas and groundwater recharge capabilities, install monitoring wells and pump stations, and implement other upgrades.

The APE for the undertaking encompasses a total of approximately 110.5 acres and 9.6 linear miles of pipeline alignment located mostly within existing road rights-of-ways. The vertical extent of the APE is anticipated to range between 4.5 and 6.0 feet below surface for the pipelines and upgrades and between 250 to 750 feet below surface for the monitoring wells. The entire APE lies within portions of Sections 11-15 and 26, T2N R1E, and Sections 7 and 18, T2N R2E, San Bernardino Baseline and Meridian (Figs. 1-4).

The study is a part of the environmental review process for the undertaking, as required by the lead agencies, namely the Big Bear Area Regional Wastewater Agency (BBARWA) under the California Environmental Quality Act (CEQA) and the State Water Resources Control Board (SWRCB) under Section 106 of the National Historic Preservation Act (NHPA). The purpose of the study is to provide the BBARWA and the SWRCB with the necessary information and analysis to determine whether the undertaking would have an adverse effect on any "historic properties," as defined by 36 CFR 800.16(l), or "historical resources," as defined by Calif. PRC §5020.1(j), that may exist in or near the APE.

In order to accomplish this objective, CRM TECH conducted a historical/archaeological resources records search, pursued historical and geoarchaeological background research, consulted with Native American representatives, and carried out a systematic field survey. The following report is a complete account of the methods, results, and conclusion of the study. Personnel who participated in the study are named in the appropriate sections below, and their qualifications are provided in Appendix 1.

SETTING

CURRENT NATURAL SETTING

Situated in the eastern portion of Big Bear Valley and deep in the San Bernardino Mountains, the APE is characterized by its alpine climate and forest-dominated environment, in sharp contrast to the Mediterranean climate and desert environment in most of southern California. Seasonal temperatures in Big Bear Valley range from an average low of nine degrees Fahrenheit in January to an average high of 89 degrees in July, much closer to the national average than to that of the nearby San Bernardino-Riverside region (NOAA n.d.). The average annual precipitation reaches more than 18 inches of rainfall and 35 inches of snowfall (*ibid.*). Most of the APE is situated in the vicinity of Baldwin Lake, the only large natural lake in the San Bernardino Mountains, the shoreline of which is subject to substantial changes due to ambient mountain runoff.

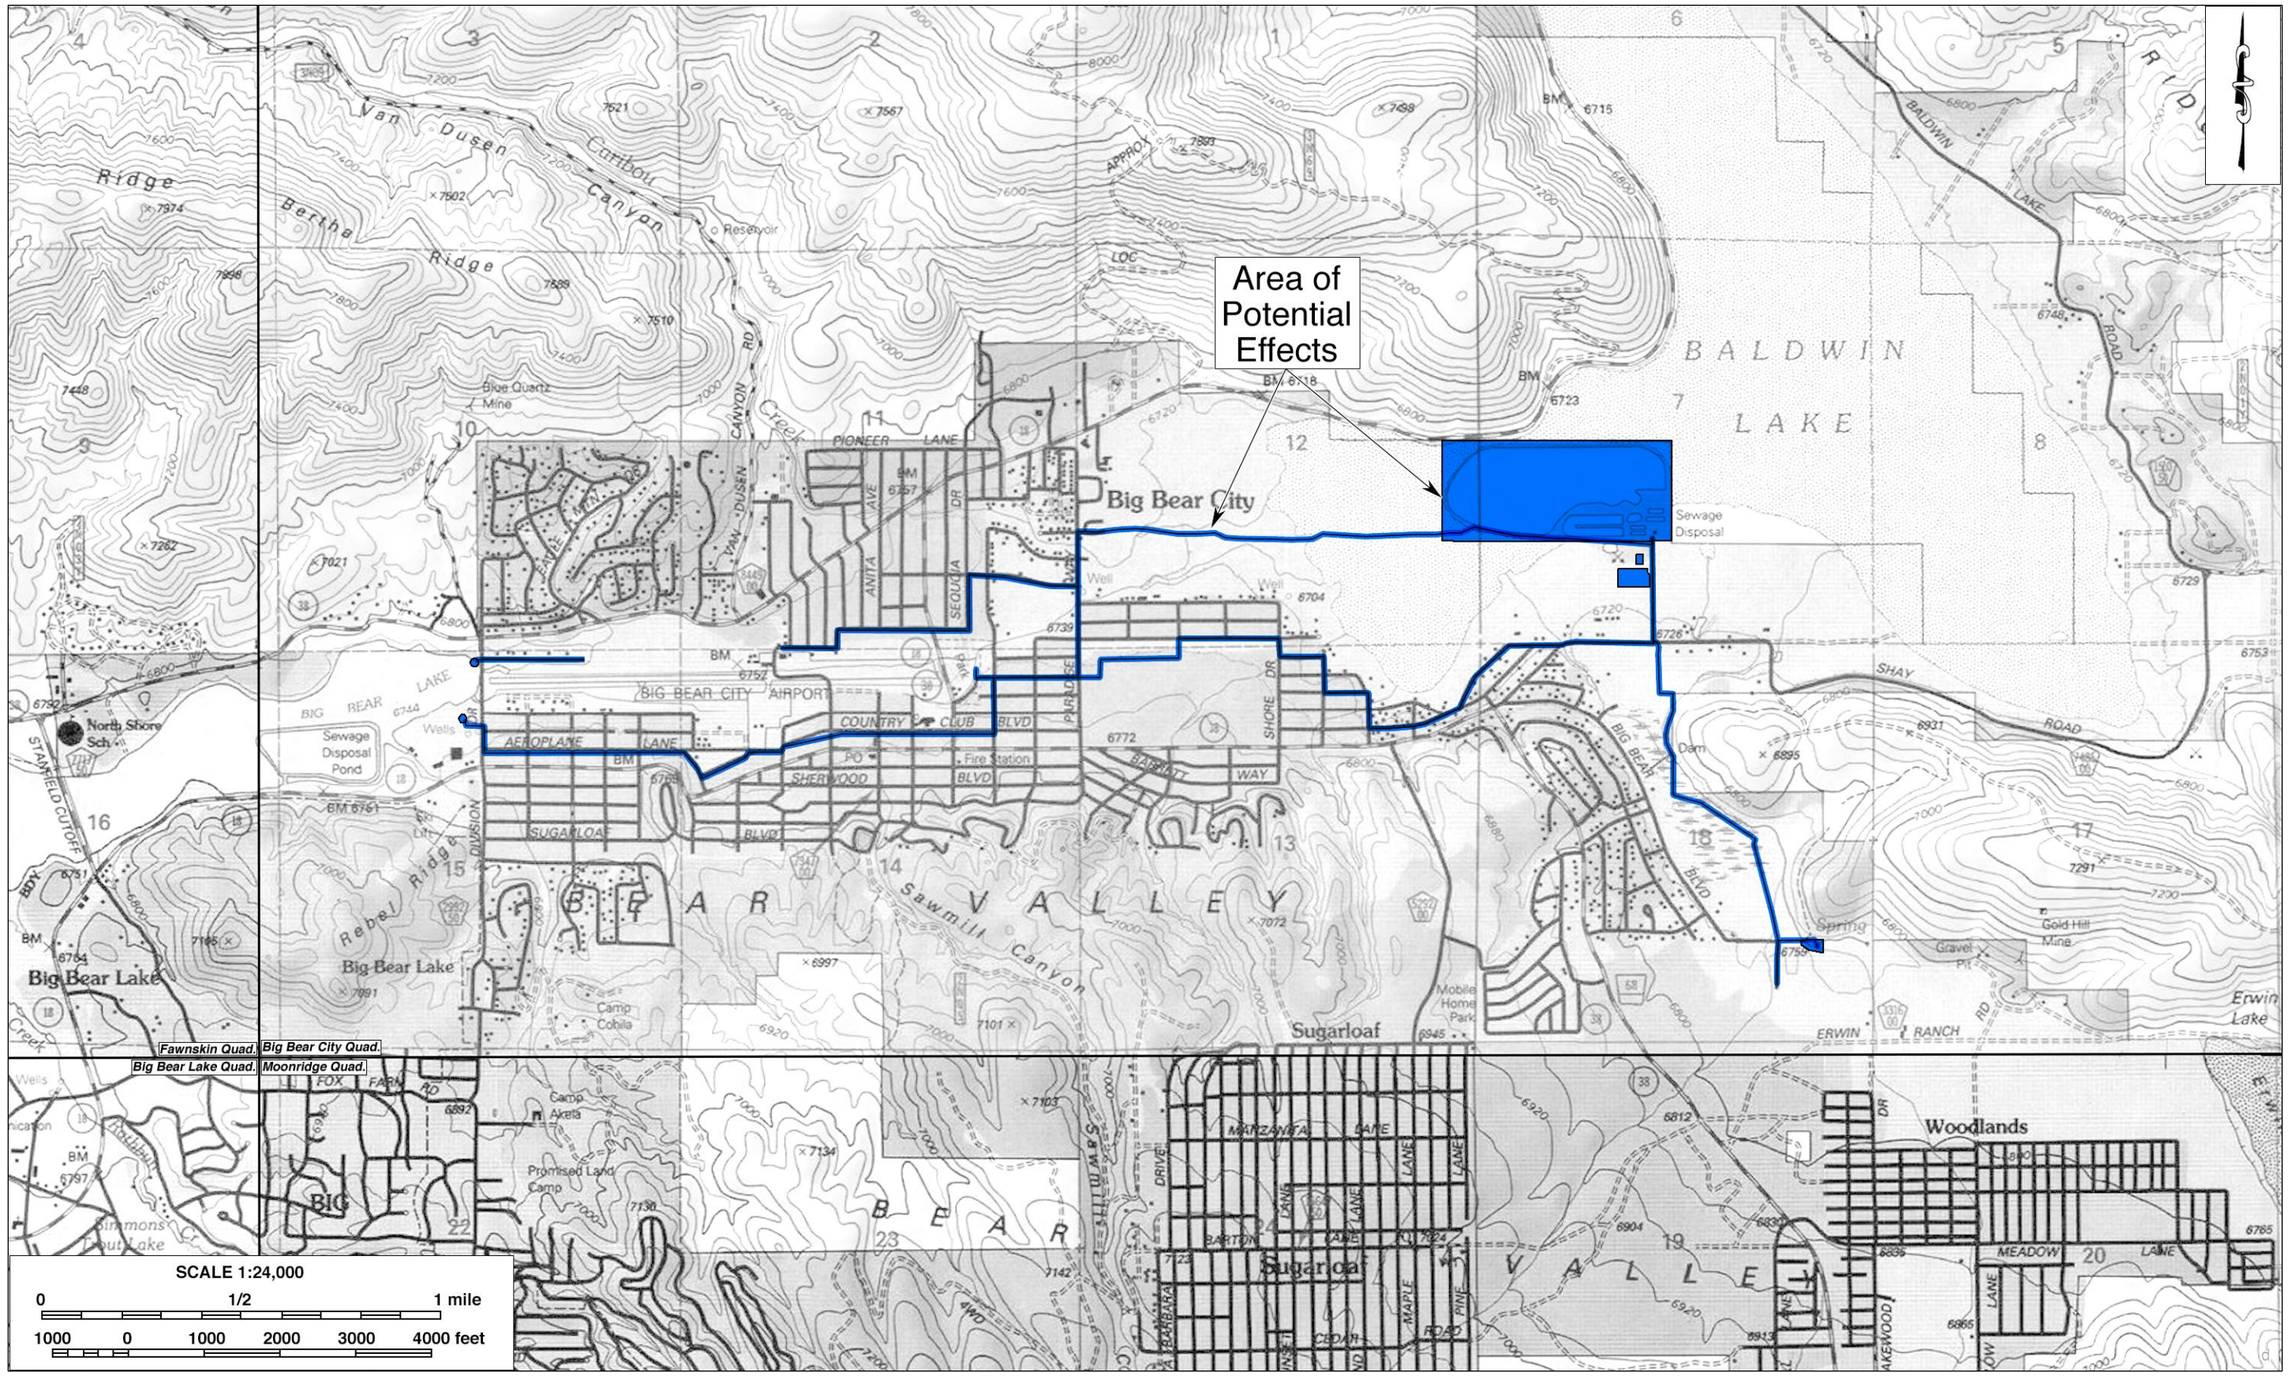

Figure 1. Area of Potential Effects, northern portion. (Based on USGS Big Bear City, Big Bear Lake, Fawnskin, and Moonridge, Calif., 7.5' quadrangles [USGS 1996a-1996d])

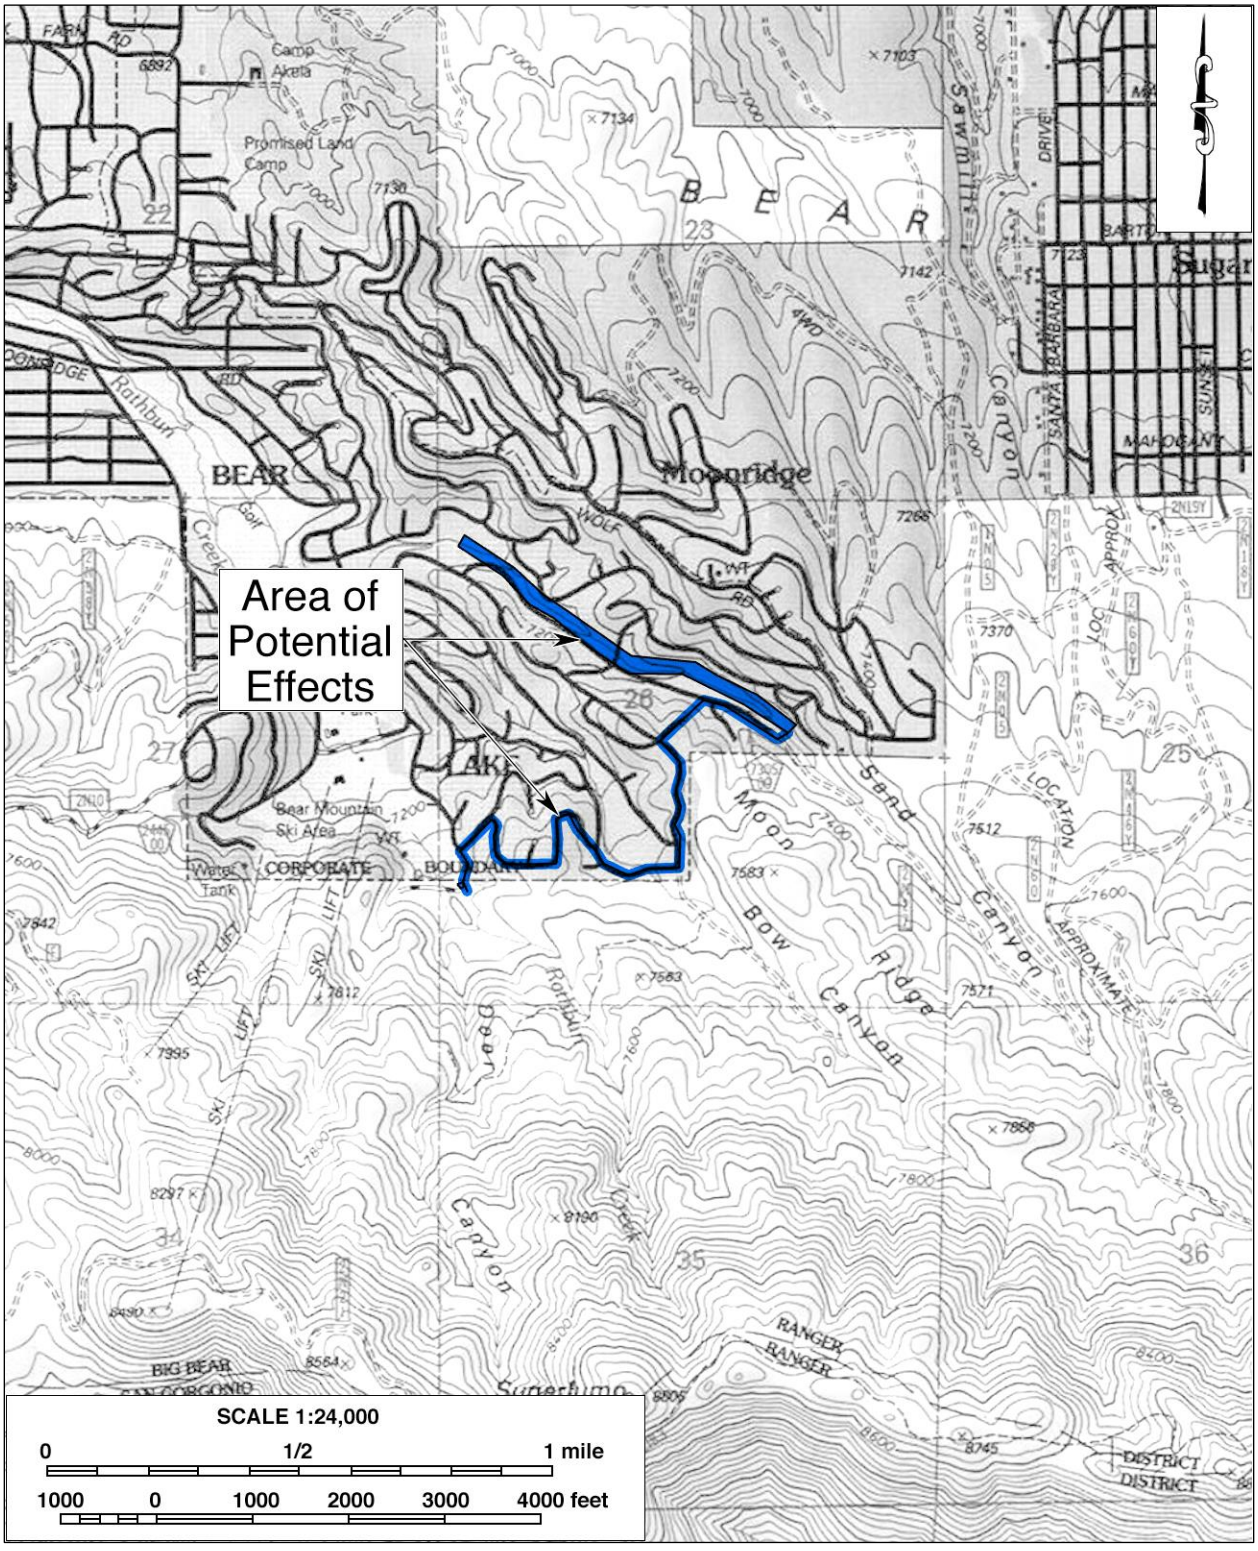

Figure 2. Area of Potential Effects, southern portion. (Based on USGS Moonridge, Calif., 7.5' quadrangle [USGS 1996d])

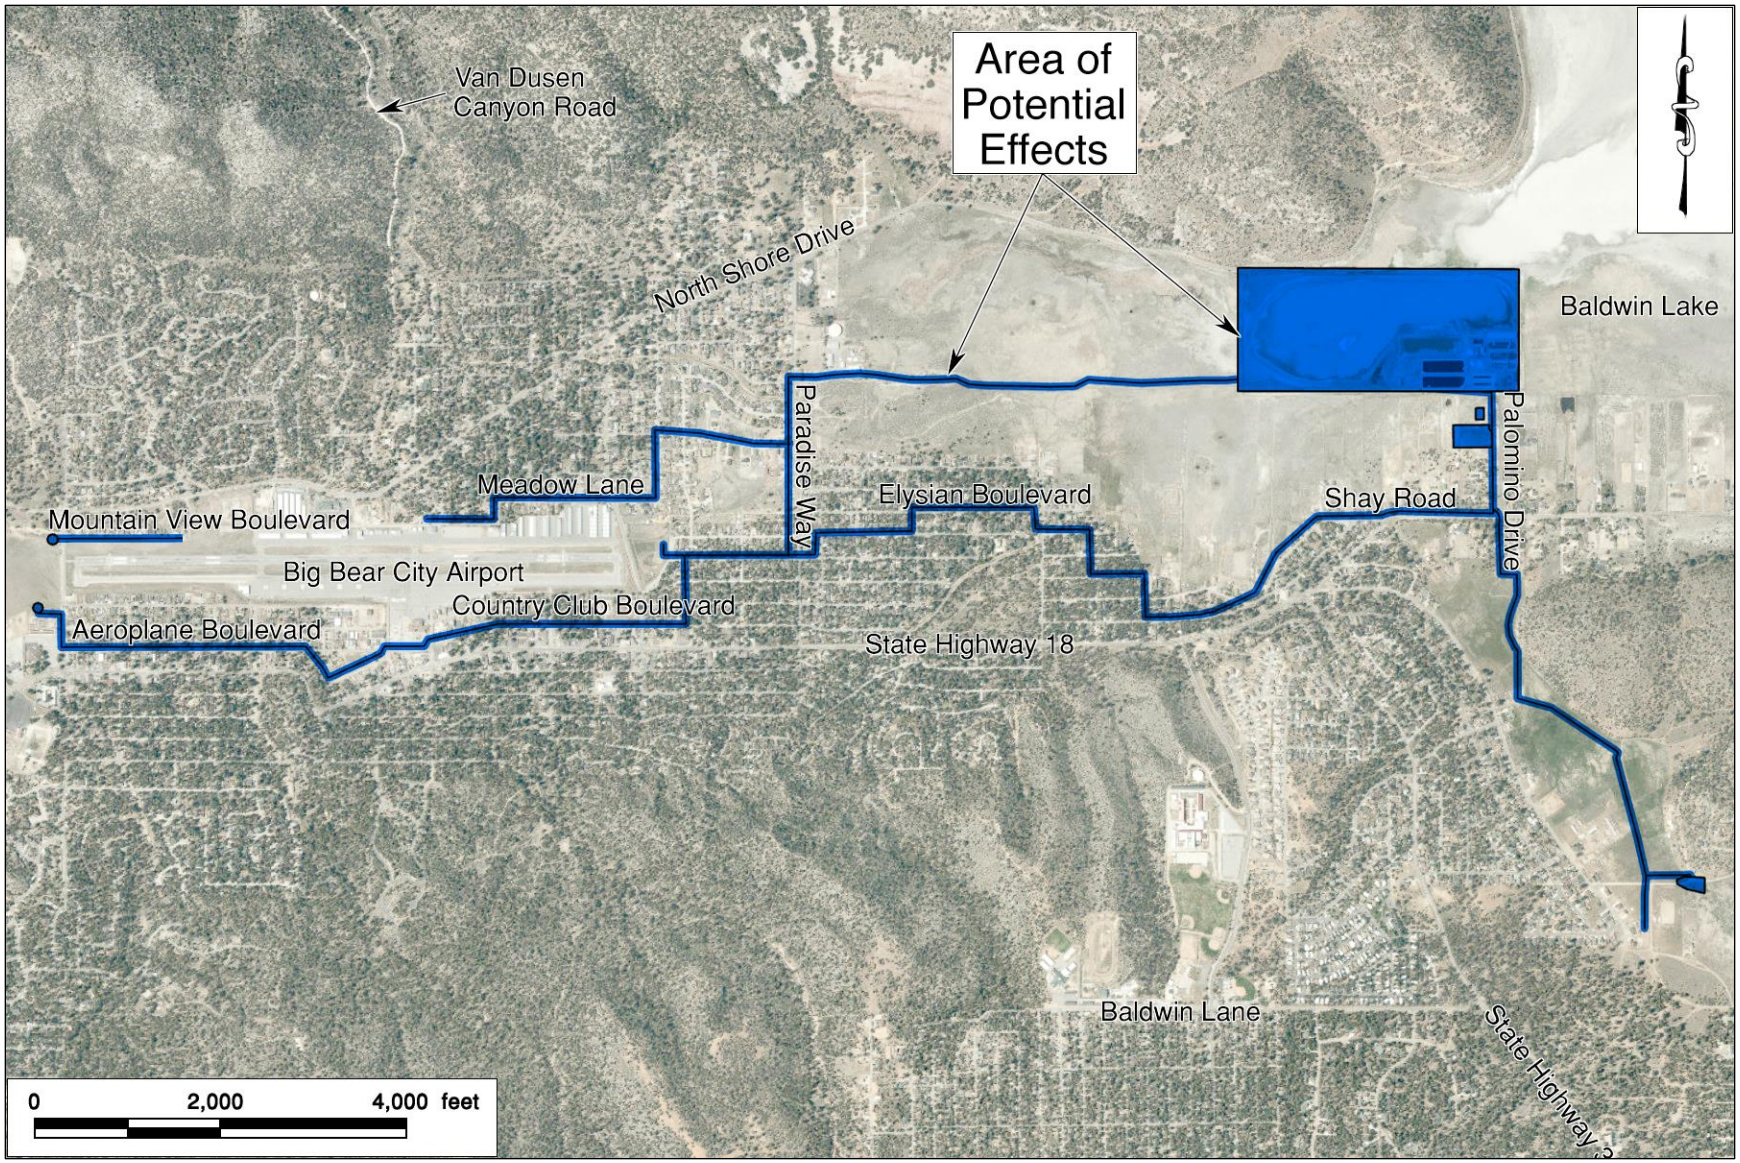

Figure 3. Aerial view of the APE, northern portion. (Based on Google Earth imagery)

Figure 4. Aerial view of the APE, southern portion. (Based on Google Earth imagery)

The largest portion of the APE falls within the 93.5-acre BBARWA treatment plant at 122 Palomino Drive, on a peninsula on the south shore of Baldwin Lake, along with the agency's headquarters at 121 Palomino Drive and an adjacent two-acre field (Figs. 1, 3). Next largest is some 14 acres within the Sand Canyon recharge site and channel, a northwest-southeast trending drainage in the Moonridge area, and the one-acre Shay Pond recharge (Figs. 1-4). Another component of the APE is approximately 9.4 miles of pipeline alignment within various roads in residential areas to the west of Baldwin Lake and in the southern portion of the Moonridge area (Figs. 1-4). At these locations, the project plans will expand and improve discharge areas and groundwater recharge capabilities, install monitoring wells and pump stations, and implement other upgrades.

The ground surface throughout the APE has been extensively disturbed by construction and maintenance of the wastewater treatment facilities and public roads, by mechanical clearing of the open field, and by water movement and discharge activities at Sand Channel and Shay Pond (Fig. 5). Surface soils are composed of sandy alluvium mixed with quartzite and granitic cobbles. Elevations in the APE range around approximately 6,000 to 9,900 feet above mean sea level, with the lower elevations near the Baldwin Lake shoreline. Vegetation in the vicinity includes conifer and evergreen trees, low-lying brush and grasses, and landscaping plants near the roadways.

CULTURAL SETTING

Archaeological Context

The earliest evidence of human occupation in inland southern California was discovered below the surface of an alluvial fan in the northern portion of the Lakeview Mountains, overlooking the San Jacinto Valley, with radiocarbon dates clustering around 9,500 before present (B.P.; Horne and McDougall 2008). Another site found near the shoreline of Lake Elsinore, close to the confluence of Temescal Wash and the San Jacinto River, yielded radiocarbon dates between 8,000 and 9,000 B.P. (Grenda 1997). Additional sites with isolated Archaic dart points, bifaces, and other associated lithic artifacts from the same age range have been found in the Cajon Pass area of the San Bernardino Mountains, typically on top of knolls with good viewsheds (Basgall and True 1985; Goodman and McDonald 2001; Goodman 2002; Milburn et al. 2008).

The cultural history of southern California has been summarized into numerous chronologies, including those developed by Chartkoff and Chartkoff (1984), Warren (1984), and others. Specifically, the prehistory of the inland region has been addressed by O'Connell et al. (1974), McDonald et al. (1987), Keller and McCarthy (1989), Grenda (1993), Goldberg (2001), and Horne and McDougall (2008). Although the beginning and ending dates of the recognized cultural horizons vary among different parts of the region, the general framework for the prehistory can be broken into three primary periods:

- Paleoindian Period (ca. 18,000-9,000 B.P.): Native peoples of this period created fluted spearhead bases designed to be hafted to wooden shafts. The distinctive method of thinning bifaces and spearhead preforms by removing long, linear flakes leave diagnostic Paleoindian markers at tool-making sites. Other artifacts associated with the Paleoindian toolkit include choppers, cutting tools, retouched flakes, and perforators. Sites from this period are very sparse across the landscape and most are deeply buried.

Figure 5. Typical landscapes in the APE. *Clockwise from top left*: northernmost setting pond in the BBARWA treatment plant, view to the northeast; elevated berm at the plant, view to the north; pipeline alignment from Mt. View Boulevard toward the treatment plant, view to the east; open field adjacent to the BBARWA headquarters, view to the north; pipeline alignment at the intersection of Paradise Way and Greenfall Lane, view to the south; Sand Canyon Channel, view to the northwest. (Photographs taken between April 21 and July 19, 2023)

- Archaic Period (ca. 9,000-1,500 B.P.): Archaic sites are characterized by abundant lithic scatters of considerable size with many biface thinning flakes, bifacial preforms broken during manufacture, and well-made groundstone bowls and basin metates. As a consequence of making dart points, many biface thinning waste flakes were generated at individual production stations, which is a diagnostic feature of Archaic sites.
- Late Prehistoric Period (ca. 1,500 B.P.-contact): Sites from this period typically contain small lithic scatters from the manufacture of small arrow points, expedient groundstone tools such as tabular metates and unshaped manos, wooden mortars with stone pestles, acorn or mesquite bean granaries, ceramic vessels, shell beads suggestive of extensive trading networks, and steatite implements such as pipes and arrow shaft straighteners.

Ethnohistorical Context

Big Bear Valley lies in the heart of the homeland of the Serrano, which together with Vanyume people, linguistically a subgroup, also includes part of the San Gabriel Mountains, much of the San Bernardino Valley, and the Mojave River valley in the southern portion of the Mojave Desert, reaching as far east as the Cady, Bullion, Sheep Hole, and Coxcomb Mountains. The name "Serrano" was derived from a Spanish term meaning "mountaineer" or "highlander." The basic written sources on Serrano culture are Kroeber (1925), Strong (1929), and Bean and Smith (1978). The following ethnographic discussion of the Serrano people is based mainly on these sources.

At least two Serrano clans lived in or near Big Bear Valley during prehistoric and protohistoric times, according to Strong (1929:11), settling mostly on elevated terraces, hills, and finger ridges near where flowing water emerged from the mountains. The Yuhavetum (or Yuhaaviatam) clan's territory stretched from Big Bear Valley to the present-day Highland area in the San Bernardino Valley. The Pervetum clan's territory extended from the vicinity of Big Bear Valley to the headwaters of the Santa Ana River, across Sugarloaf Mountain. The two clans often intermarried. Tthe clans were in turn affiliated with one of two exogamous moieties, the Wildcat (*Tukutam*) or the Coyote (*Wahiiam*). The core of the unit was the patrilineage, although women retained their own lineage names after marriage.

In Serrano oral tradition, the Big Bear Valley area is known as Yuhaaviat, or "Pine Place," and is remembered as the point of origin for the nearby Yuhaaviatam of San Manuel Nation (formerly known as the San Manuel Band of Mission Indians; Ramos 2009). It is well-documented in ethnographic literature that Big Bear Valley figures prominently in the Serrano creation story. As Kroeber (1925:619) notes:

> Kukitat [younger brother of Pakrokitat, creator of Man], feeling death approach, gave instructions for his cremation; but the suspected coyote, although sent away on a pretended errand, returned in time to squeeze through badger's legs in the circle of the mourners and make away with Kukitat's heart. This happened at *Hatauva* (compare Luiseño Tova, where Wiyot died) in Bear Valley.

In a newspaper article, James Ramos, former Chairman of the Yuhaaviatam of San Manuel Nation, generally corroborates Kroeber's account and provides the accurate spelling of the deities' names in the Serrano language, Kruktat and Pakruktat (Ramos 2009). In addition, he identifies the location of

Hatauva as being in the general vicinity of a white quartz dome known to tribal members as Aapahunane't, or Eye of God, to the east of Baldwin Lake (*ibid*.).

Prior to European contact, Serrano subsistence was defined by the surrounding landscape and primarily based on the gathering of wild and cultivated foods and hunting, exploiting nearly all of the resources available. Common tools included manos and metates, mortars and pestles, hammerstones, fire drills, awls, arrow straighteners, and stone knives and scrapers. These lithic tools were made from locally sourced material as well as materials procured through trade or travel. They also used wood, horn, and bone spoons and stirrers; baskets for winnowing, leaching, transporting, parching, storing, and cooking; and pottery vessels for carrying water, storage, cooking, and serving food and drink.

Although contact with Europeans may have occurred as early as 1771 or 1772, Spanish influence on Serrano lifeways was minimal until the 1810s, when a mission *asistencia* was established on the southern edge of Serrano territory. Between then and the end of the mission era in 1834, most of the Serrano in the western portion of their traditional territory were removed to the nearby missions. In the eastern portion, a series of punitive expeditions in 1866-1870 resulted in the death or displacement of almost all remaining Serrano population in the San Bernardino Mountains. Today, most Serrano descendants are affiliated with the Yuhaaviatam of San Manuel Nation, the Morongo Band of Mission Indians, or the Serrano Nation of Indians.

Historical Context

In 1772, a small force of Spanish soldiers under the command of Pedro Fages, military *comandante* of Alta California, became the first Europeans to set foot in the San Bernardino Mountains, followed shortly afterwards by the famed explorer Francisco Garcés in 1776 (Beck and Haase 1974:15). During the next 70 years, however, the Spanish and Mexican colonization activities in Alta California, concentrated predominantly in the coastal regions, left little physical impact on the San Bernardinos. Aside from occasional explorations and punitive expeditions against livestock raiders, the mountainous hinterland of California remained largely beyond the attention of the missionaries, the *rancheros*, and the provincial authorities. The name "San Bernardino" was bestowed on the region in the 1810s, when the mission *asistencia* and an associated rancho were established under that name in present-day Loma Linda (Lerch and Haenszel 1981).

For the Big Bear Valley area, the historic period began in 1845, when Benjamin "Benito" Wilson, influential *ranchero* in the San Bernadino Valley, and a group of young *Californios* "discovered" the valley while avenging an Indian raid (Drake 1949:12). Observing a large number of grizzly bears in the vicinity of today's Baldwin Lake, Wilson bestowed "Bear Lake" as its original name. Some 30 years later, the lake's had become Baldwin Lake, named for Elias J. "Lucky" Baldwin, who owned most of the land around the lakebed between 1874 and 1909, and briefly operated the nearby Gold Mountain Mine in 1874-1875.

After the U.S. annexation of Alta California in 1848, the dense forest covering the mountainside became the scene—and victim—of a booming lumber industry, which brought the first wagon roads and industrial establishments into the San Bernardinos (Robinson 1989:23). In Big Bear Valley, lumbering was largely limited to a number of small sawmills in support of local construction (*ibid*.:44-45), meanwhile mining quickly rose when gold was discovered near Baldwin Lake in 1855

(Robinson 1989:47). Then in 1860, William F. Holcomb hit "pay dirt" on a hillside above Big Bear Valley, and later again in the valley now bearing his name, triggering a gold rush that brought 1,000 prospectors to the San Bernardino Mountains by that fall (Holcomb 1900:273-276; Robinson 1989:48-50). By the late 19th century, mining was big business, with Elias J. "Lucky" Baldwin's Gold Mountain Mining Company usurping individual prospectors as the dominant force in the industry (Drake 1949:19; Robinson 1989:57-71). Still, the much-anticipated "mother lode" was never found, and by the late 1940s mining was no longer the leading industry in the valley (Core 1980:11-12; Robinson 1989:57, 61-62, 70-71).

Around the same time as the Bear-Holcomb Valley gold rush, the San Bernardino Mountains' reputation as a premium summer grazing ground for sheep and cattle also grew, with Big Bear Valley at the epicenter (Robinson 1989:85). Some of the most prominent figures in early local history, including Augustus "Gus" Knight, Sr., James W. Smart, John R. Metcalf, and the Talmadge brothers, were also among those at the forefront of the cattle industry (*ibid.*:85-86). Beef sales from the valley peaked in 1921 before going into decline afterwards, as increasing resort and residential development drove up real estate value and shrank the availability of pastureland (Drake 1949:25; Robinson 1989:88, 93-94).

Along with its colorful history in lumber, gold, and cattle, Big Bear Valley owes much of its growth over the past century to the creation of Big Bear Lake, a reservoir built for the purpose of irrigating the vast citrus groves in the eastern San Bernardino Valley. Frank E. Brown and Edward G. Judson, founders of the Redlands colony, organized the Bear Valley Land and Water Company in 1883 and completed construction of the Big Bear dam in 1884 (Robinson 1989:170). The reservoir was filled during the following winter (Hall 1888:188; Hinckley 1974:41). The project's much-celebrated success was cut short over the next five years as the company's successors attempted to expand the irrigation scheme into Riverside County and became overextended (Robinson 1989:173).

A financial panic in 1893 was later compounded in the late 1890s by drought so severe that Big Bear Lake completely dried up in the summers of 1898, 1899, and 1900 (Hinckley 1983:1). As a remedy, in 1903 citrus growers in the Redlands-Highland area incorporated as the Bear Valley Mutual Water Company and took over the Bear Valley system (*ibid.*:1-2; Robinson 1989:173). Between 1910 and 1912, the new water company constructed the second Big Bear dam that is still in use today (Hinckley 1974:43; 1983:11). The new dam, although only 20 feet higher than the first, substantially increased the size of the reservoir and nearly tripled its capacity (Robinson 1989:174).

By the 1890s, excessive logging and sheep grazing in the San Bernardino Mountains had given rise to a forest conservation movement among residents of the San Bernardino Valley to protect the watershed. In 1893, the movement succeeded in persuading the U.S. government to create the San Bernardino Forest Reserve, later renamed the San Bernardino National Forest, and over the next few decades effectively brought an end to logging and sheep grazing in the San Bernardino Mountains (Robinson 1989:96-99; Robinson and Risher 1990:9).

Meanwhile, Big Bear Lake proved a powerful lure for vacationers and sportsmen, who would commandeer the log cabins left by construction crews (Atchley 1980:21-22). In 1887, the state authorities stocked the lake with thousands of Lake Tahoe trout, signaling the beginning of its development as a recreational property (*ibid.*:22). Three decades later, in 1916, the Bear Valley Mutual Water Company officially dedicated the lake surface to the free use by the public for

hunting, fishing, and boating (Hinckley 1983:43, 79), thereby guaranteeing Big Bear Valley's future as one of the most popular mountain resorts in southern California.

The first commercial resort established on the lakeshore was Gus Knight, Jr., and John Metcalf's Bear Valley Hotel, which opened for business in 1888 (Atchley 1980:22-23). After the Redlands-based Pine Knot Resort Company purchased the hotel in 1906 and renamed it the Pine Knot Lodge, a small community bearing the same name began to form around the lodge (Robinson 1989:181-182). Knight would later develop the Wild Rose Park and Knight's Camp near Baldwin Lake (*ibid.*), and in the meantime became a tireless promoter for the construction of new and better roads between the San Bernardino Valley and his resorts. His efforts helped bring about the roads through City Creek Canyon (1892), Mill Creek Canyon (1888), and Santa Ana Canyon (1899), and culminated with the completion of Rim of the World Drive in 1915 (Atchley 1980:23-26; Robinson 1989:179-183).

The completion of Rim of the World Drive brought about an exponential rise in the number of resorts in Big Bear Valley from two in 1913 to 52 in 1921 (Drake 1949:26; Robinson 1989:183-185). Winter snow in the mountains held its own attraction and brought a new set of residents and visitors as the Big Bear Valley area became a year-round getaway. A popular but rudimentary ski jump built in 1932 to the south of Pine Knot spurred the formation of the Big Bear Lake Park District two years later, which in turn brought about the first ski lift in the valley in 1949 (Robinson 1989:193-194). Since then, winter sports have become one of Big Bear Valley's leading attractions.

Adding to the allure, in the early 20th century Hollywood moviemakers found Big Bear Valley to be a suitable scenic backdrop for films such as *Paint Your Wagon*, *The Parent Trap*, *Bonanza*, *Kissin' Cousins*, and *Dr. Dolittle* (Atchley 1980:24-25). In 1916, the Bear Valley Mutual Water Company started a land boom in Big Bear Valley when it created a subsidiary, the Bear Valley Development Company, to subdivide, sell, and lease the company's land holdings around the reservoir (Hinckley 1983:42). Other landowners in the valley, such as the Knights and the Talmadges, soon joined in to take advantage of the increasing popularity of Big Bear Lake (Robinson 1989:187). The boom continued into the 1920s, with summer homes springing up at the rate of 50 to 100 per year (Robinson 1989:189). In 1938, Pine Knot and its surrounding area came to be known as the community of Big Bear Lake, while a smaller cluster of homes and hostelries between Big Bear and Baldwin Lakes became Big Bear City (*ibid.*:193).

More recent development in Bear Valley began in earnest after the end of World War II (NETR Online 1938-1969), with progress along Big Bear Lake's shoreline eclipsing Baldwin Lake due to its seasonal nature. In 1980, Big Bear Lake became the first incorporated city in the San Bernardino Mountains, while less urbanized communities in the eastern portion of the valley, including Moonridge and Big Bear City, have remained unincorporated to the present time.

RESEARCH METHODS

RECORDS SEARCH

On December 14, 2022, CRM TECH archaeologist Nina Gallardo conducted the cultural resources record search for this study at the South Central Coastal Information Center (SCCIC) on the campus

of California State University, Fullerton, which is the official repository for San Bernardino County in the California Historical Resources Information System. During the records search, Gallardo examined the SCCIC's digital maps, records, and databases for previously identified cultural resources and existing cultural resources reports within a one-mile radius of the APE. Previously identified cultural resources included properties designated as California Historical Landmarks, Points of Historical Interest, and San Bernardino County Landmarks, as well as those listed in the National Register of Historic Places, the California Register of Historical Resources, or the California Historical Resources Inventory.

GEOARCHAEOLOGICAL ANALYSIS

As part of the research procedures, CRM TECH archaeologist Deirdre Encarnación pursued geoarchaeological analysis to assess the APE's potential for the deposition and preservation of subsurface cultural deposits from the prehistoric period, which cannot be detected through a standard surface archaeological survey. Sources consulted for this purpose included primarily topographic and geologic maps and reports pertaining to the surrounding area. Findings from these sources were used to develop a geomorphologic history of the APE and address geoarchaeological sensitivity of the vertical APE.

NATIVE AMERICAN PARTICIPATION

On November 21, 2022, CRM TECH submitted a written request to the State of California Native American Heritage Commission (NAHC) for a records search in the commission's Sacred Lands File. Following the NAHC's recommendations and previously established consultation protocol, on December 30, 2022, CRM TECH further contacted a total of 13 Native American groups in the region in writing for additional information on potential Native American cultural resources in the project vicinity. Follow-up telephone solicitations were carried out between January 13 and February 17, 2023. Correspondence between CRM TECH and the Native American representatives is summarized below, and a complete record is attached to this report in Appendix 2.

HISTORICAL BACKGROUND RESEARCH

Historical background research for this study was conducted by CRM TECH historian Terri Jacquemain. Sources consulted during the research included published literature in local history, historical maps of the Big Bear Valley area, and aerial/satellite photographs of the project vicinity. Among the maps consulted for this study were U.S. General Land Office (GLO) land survey plat maps dated 1858 and U.S. Geological Survey (USGS) topographic maps dated 1902-1996, which are accessible at the websites of the USGS and the U.S. Bureau of Land Management. The aerial and satellite photographs, taken between 1938 and 2022, are available at the Nationwide Environmental Title Research (NETR) Online website and through the Google Earth software.

FIELD SURVEY

The field survey of the APE was carried out in several phases. On April 21, 2023, CRM TECH field director Daniel Ballester and project archaeologist Hunter O'Donnell carried out the initial survey using both reconnaissance- and intensive-level methods. The reconnaissance survey primarily covered the pipeline alignments and was conducted by driving along the paved roadways along the

proposed pipeline alignment and visually inspecting the surrounding area for any indication of cultural resources. The intensive-level survey was conducted on foot in areas where ground surface was exposed, such as along unpaved roads and one pipeline alignment located south of Shay Road leading to Shay Pond.

On April 28, 2023, Hunter O'Donnell conducted the survey of the BBARWA treatment plant and the surrounding pipeline alignments to the best of possibility as much of the western end and northeast corner of the facility were inundated by waters from the adjacent Baldwin Lake. Portions of nearby pipeline alignments were also inaccessible due to flooding. O'Donnell was able to survey the unflooded portion of the plant at an intensive level and inspect the structures, basins, and ponds situated at higher elevations.

As additional facility sites and pipeline alignments were identified in the design process and added to the APE, Daniel Ballester surveyed these areas on June 21 and July 19, 2023, using similar methods. In this way, the ground surface in the entire APE was systematically and carefully examined for any evidence of human activities dating to the prehistoric or historic period (i.e., 50 years ago or older). Other than areas obscured by pavement or flooding, visibility of the native ground surface ranged from poor to good depending on the density of the vegetation growth (Fig. 5).

RESULTS AND FINDINGS

RECORDS SEARCH

According to SCCIC records, various portions of the APE were included in some two dozen past cultural resources studies completed between 1977 and 2011, but the APE as a whole had not been surveyed systematically prior to this study. As a result of these past studies, SCCIC records identified 16 historical/archaeological resources as lying partially within the APE, including 1 prehistoric (i.e., Native American) site, 1 natural feature that acquired cultural significance, and segments of 14 roads dating to the historic period (see App. 3 for locations). These 16 known cultural resources are listed in Table 1, and further information about them is presented in Appendix 4.

Prehistoric site 36-002060 was originally recorded in 1969 as containing "points, flakes (some obsidian), and sherds" that was scattered over a half-mile near the present-day intersection of Shay Road and Palomino Drive (Simpson 1969:1). These or similar artifacts were observed during field visits in 1989 and 1990, and the catalog expanded to include additional flakes, scrapers, primary flakes, a projectile point (McKenna 1989:1), as well as manos, possible metate fragments, and a bone needle (Love and DeWitt 1990:1). A monitoring program in 1996 further noted recovery of three quartzite flakes and 11 tested cores (Sander 1996:2). Most recently, the site area was revisited in 2004, after much of the land had been developed for residential use (NETR Online 2002; 2005; County of San Bernardino n.d.), but only three flakes were observed at that time (Zavala et al. 2004:1).

Baldwin Lake (36-015027) received official recognition in 1973 as California Point of Historical Interest No. SBr-014 as the only naturally occurring lake in the San Bernardino Mountains and because of its colorful early history in connection to the 1845 Wilson expedition (State of California

Table 1. Previously Recorded Cultural Resources in the APE		
Primary No.	**Other Designation**	**Description**

36-024563	CA-SBR-15604H	Holcomb View Drive

1973; see "Historical Context," above). In addition, as mentioned above (see "Ethnohistorical Context"), local Serrano creation legend identifies Baldwin Lake as the location where the deity Kruktat died and was cremated (Kroeber 1925:619; Ramos 2009). As such, Baldwin Lake, the original Bear Lake before the present-day Big Bear Lake reservoir was built, is clearly a property of both Native American traditional cultural value and later Anglo-American historical interest.

The 14 road segments in the APE were all recorded during a 2011 reconnaissance-level study of road rights-of-way in the Big Bear City area between Big Bear Lake and Baldwin Lake. They were described predominantly as paved two-lane roads that generally date to the early post World War II years.

Within the one-mile scope of the records search, SCCIC records identify roughly 150 additional previous studies, in all covering roughly 80% of the total acreage, attesting to the vigorous development in the Big Bear City area in recent decades. These studies have resulted in the recording of some 250 additional cultural resources within the one-mile radius. Of these, 120 were prehistoric in origin, including 76 archaeological sites and 46 isolates, or localities with fewer than three artifacts. The rest of the previously recorded cultural resources dated to the historic period, including 110 sites and a handful of isolates. Among the sites were refuse scatters, mining prospects, camp remains, and linear features such as roads, ditches, and fences, and the isolates included cans and a metal badge. The locations of these resources are provided in Appendix 3.

The prehistoric sites were predominantly bedrock milling features, lithic scatters, and sites that contained both, in one case with a scatter of ceramic sherds as well, with at least one rock shelter and a trail also recorded. The types of sites are associated mostly with resources procurement, but several of the larger lithic scatters and/or bedrock milling feature clusters were interpreted as village sites or camp sites. The majority of the prehistoric isolates consisted of lithic flakes, either of jasper or quartzite materials. Other isolate types included milling slabs, mano and mano fragments, and point fragments.

GEOARCHAEOLOGICAL ANALYSIS

According to Bortugno and Spittler (1986), the APE is situated upon lake deposits (*Ql*) and well-dissected alluvial fan sediments (*Qod*), both of them Pleistocene in age, as well as Holocene-age undifferentiated alluvium (*Q*). Miller (2004) has mapped the surface sediments at the BBARWA treatment plant and along the northerly pipeline alignments as mostly *Qyf* and some *Ql*, with *Qs* sediments present along the southerly alignments in the northern portion of the APE. *Qyf* is defined as young alluvial fan deposits of Holocene and late Pleistocene age, *Ql* is very young lacustrine deposits (lake deposits) of Holocene age, and *Qs* is very young surficial deposits dating to the late Holocene, including wash, fan, colluvium, and alluvial-valley deposits (*ibid*.).

In light of their relatively young age and alluvial origin, the subsurface sediments in the APE have the potential to contain buried deposits of prehistoric cultural remains. However, geospatial analyses of known prehistoric sites in the vicinity show the majority of these sites, especially the potential habitation sites, to be located primarily to the north or southeast, away from the shores of Baldwin Lake. While the APE would likely have been used for resource procurement, travel, and occasional camping during these activities, the potential for inundation along the shores of Lake Baldwin as part of seasonal cycles would not have made the treatment plant site or most of the pipeline alignments ideal areas for long-term habitation. This is corroborated by the ethnographic literature that identifies foothills as the preferred settlement environment for Native Americans of the inland region (Bean and Smith 1978).

Most of the APE, nearly 94 of 110 acres, lies within the lakebed of Baldwin Lake, while much of the rest is along natural drainages. Neither of these settings would have been considered suitable for permanent villages in ancient times. As most of it coincides with existing water facilities and public roads, the ground surface in the APE has typically been extensively disturbed by construction and maintenance activities as well as natural fluvial erosion. In short, land in these settings is not conducive to either the deposition or the preservation of potentially significant prehistoric cultural remains.

According to as-built plans for a recent street improvement project on nearby Big Bear Boulevard, underground electric and gas lines within the right-of-way required excavations to the depth of four feet and eight inches for the placement of a six-inch-diameter conduit (Caltrans 2013:U28-U29). While no such data has been obtained for the current APE, a similar depth of prior disturbance is typical within the rights-of-way for paved roads. Other than the relatively shallow disturbances along the proposed pipeline alignments and for equipment upgrades at existing facility sites, the most notable, deep-reaching disturbance will be associated with the monitoring wells, which are small-diameter borings reaching well beyond any expected subsurface archaeological deposits. Based on these considerations, the likelihood of encountering intact, potentially significant prehistoric cultural remains within the vertical APE appears to be relatively low.

NATIVE AMERICAN PARTICIPATION

On December 16, 2022, the NAHC replied in writing that the Sacred Lands File identified unspecified Native American cultural resource(s) in the vicinity of the APE and referred further inquiries to the Yuhaaviatam of San Manuel Nation and the Morongo Band of Mission Indians

Council (see App. 2). Meanwhile, the NAHC also recommended consulting with other local Native American groups and provided a list of potential contacts in the region for that purpose.

Upon receiving the NAHC's reply, CRM TECH initiated consultation with all 13 local Native American groups on the referral list (see App. 2). In some cases, the designated tribal spokespersons on cultural resources issues were contacted in lieu of individuals identified by the NAHC, as recommended in the past by the appropriate tribal government staff. The 13 Native American representatives contacted are listed below:

- Patricia Garcia-Plotkin, Tribal Historic Preservation Officer, Agua Caliente Band of Cahuilla Indians;
- Amanda Vance, Chairperson, Augustine Band of Cahuilla Mission Indians;
- Michael Mirelez, Director of Cultural Affairs, Cabazon Band of Mission Indians;
- BobbyRay Esparza, Cultural Coordinator, Cahuilla Band of Indians;
- Ray Chapparosa, Chairperson, Los Coyotes Band of Cahuilla and Cupeño Indians;
- Ann Brierty, Tribal Historic Preservation Officer, Morongo Band of Mission Indians;
- Jill McCormick, Historic Preservation Officer, Quechan Tribe of the Fort Yuma Reservation;
- John Gomez, Jr., Cultural Resource Coordinator, Ramona Band of Cahuilla Indians;
- Jessica Mauck, Cultural Resources Analyst, Yuhaaviatam of San Manuel Nation;
- Vanessa Minott, Tribal Administrator, Santa Rosa Band of Cahuilla Indians;
- Mark Cochrane, Co-Chairperson, Serrano Nation of Mission Indians;
- Joseph Ontiveros, Cultural Resources Director, Soboba Band of Luiseño Indians;
- Alesia Reed, Cultural Committee, Torres-Martinez Desert Cahuilla Indians.

As of this time, seven tribal representatives have responded to the inquiry (see App. 2). Among them, the Santa Rosa Band, the Los Coyotes Band, and the Quechan Tribe had no comments on this undertaking. The Quechan Tribe deferred to tribes located in closer proximity to the APE, as did the Agua Caliente Band, who found the APE to be outside their traditional use area. Meanwhile, Soboba Band deferred specifically to the Yuhaaviatam of San Manuel Nation.

The Augustine Band stated that they were unaware of any cultural resources in the APE but requested immediate notification if such resources were discovered during the undertaking. The Morongo Band identified the APE as a part of their ancestral territory and indicated that they would pursue government-to-government consultation with the lead agencies. As a part of that process, the Morongo Band requested to review all cultural resources documentation for the undertaking.

HISTORICAL BACKGROUND RESEARCH

Despite Big Bear Valley's long history of Native American habitation and early Euro-American enterprises such as gold mining, lumbering, and cattle ranching, the only human-made features known to be present in or near the APE in the 1850s were two Indian trails (Figs. 6, 7). The "dry bed of Bear Lake," or present-day Baldwin Lake, was noted about 1,500 feet to the east of the northern portion of the APE at that time (Fig. 6). By the turn of the century, a sparse web of roads has emerged in the project vicinity, connecting a few named locations in the eastern Big Bear Valley, such as Gold Mountain, Saragossa Springs, Doble and, closest to the APE, Lakeview Mill (Fig. 8).

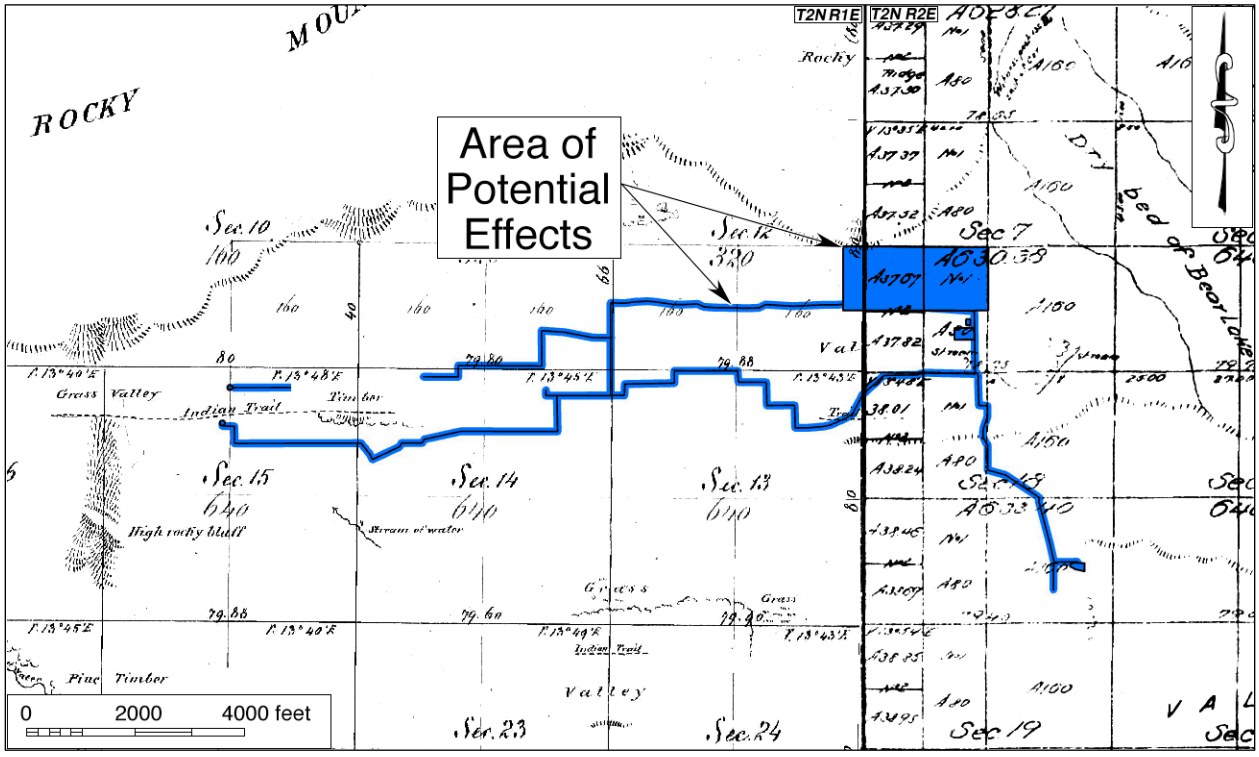

Figure 6. Northern portion of the APE in 1857-1858. (Source: GLO 1858a; 1858b)

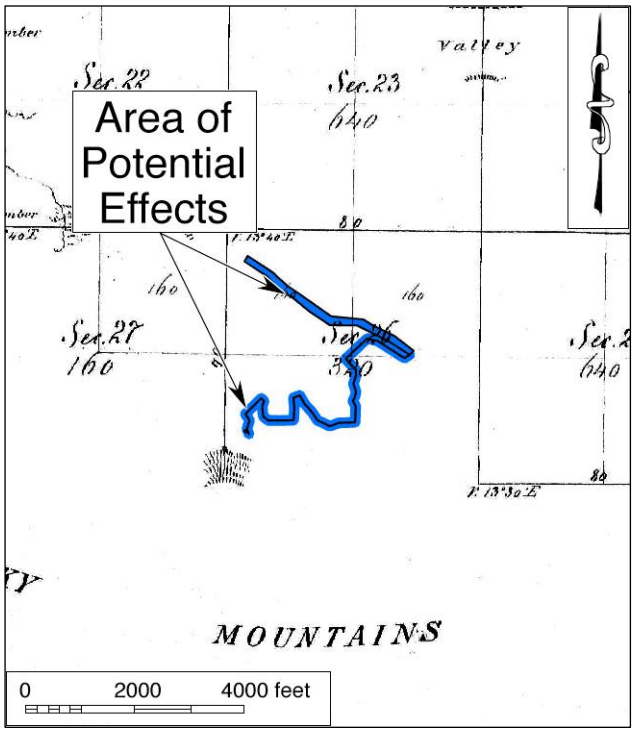

Figure 7. Southern portion of the APE in 1857-1858. (Source: GLO 1858a)

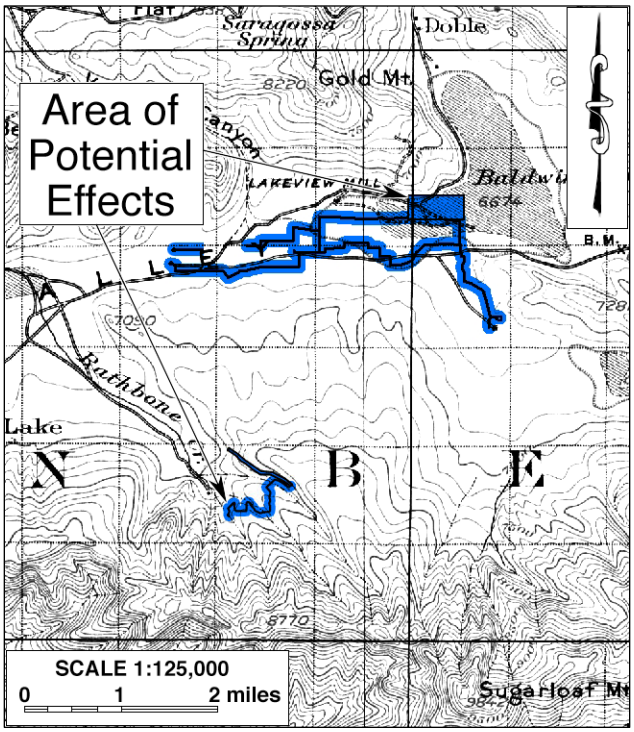

Figure 8. The APE in 1899. (Source: USGS 1902)

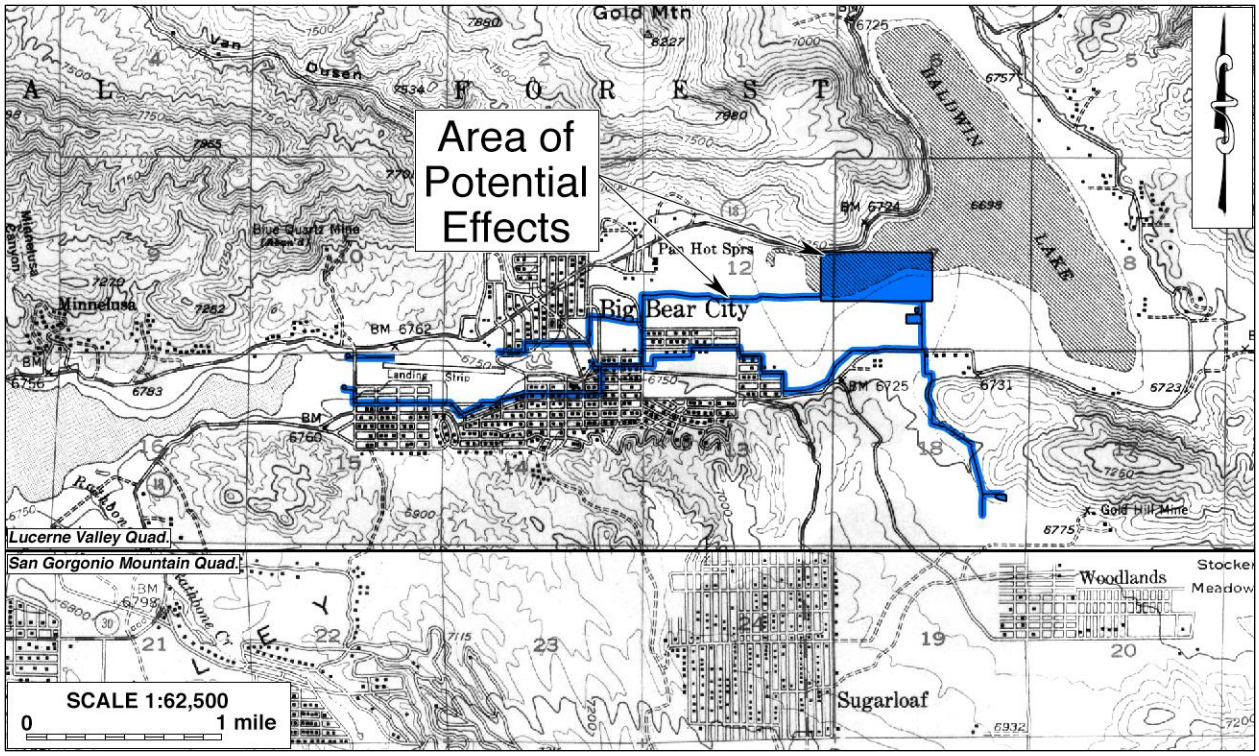

Figure 9. Northern portion of the APE in 1945-1954. (Source: USGS 1947; 1954)

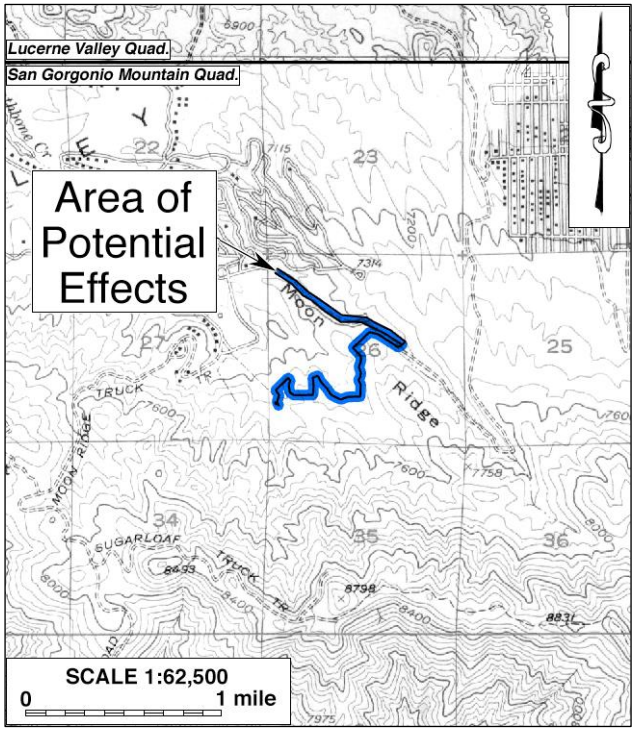

Figure 10. Southern portion of the APE in 1945-1954. (Source: USGS 1947; 1954)

By the mid-20th century Big Bear City had taken shaped, marked by a dense grid of roads lined by buildings, with the similar but smaller communities of Sugarloaf, Woodlands, and Moonridge also established nearby (NETR Online 1938; 1945; Figs. 9, 10). Development in this area continued through the rest of the 20th century, albeit at a slower pace than the City of Big Bear Lake (NETR Online 1945-2020). Nevertheless, over the next three decades new building filled most of the neighborhoods, and by the end of the 20th century there were few vacant lots left (NETR Online 1945-2002; Google Earth 1985-2002). The pace of development has since steadied, with the surrounding area retaining a largely rural character to this day (NETR Online 2002-2020; Google Earth 2002-2022).

Construction began on the wastewater plant (WWTP) and oxidation ponds in circa 1966 (*San Bernardino County Sun* 1965), with

weather-related setbacks faced during construction once work was almost completed

(*San Bernardino County* Sun 1967). In December 1966, sewer trenches were washed out in storms, and a pump station was installed but inoperable (*ibid.*). The WWTP facility is apparent in an aerial photo taken in 1969, with the two balance chambers, the berm surrounding the facility, and what may be an oxidation pond that is no longer present visible (NETR Online 1969). Clarifiers No. 1 and No. 2 and rotors were later constructed in April 1974 (Burton 2023), followed by the two southernmost aeration tanks and basins and several outbuildings (NETR Online 1983).

As a result of further growth in eastern Big Bear Valley, a Joint Powers Agreement was signed in 1972 between the Big Bear City Community Services District, the Big Bear Lake Sanitation District, and the County of San Bernardino to develop a study regarding sewage treatment, disposal, and wastewater management (Burton 2023). This would lead to the formation of the Big Bear Valley Wastewater Planning Commission and ultimately, in 1974, the BBARWA. Expansions and upgrades continued at the WWTP through the formation of the BBARWA, including at least six outfall line modifications and realignments between 1981 and 2011, and the construction of a 10-million-gallon storage pond at the WWTP in 2002 (*ibid.*).

FIELD SURVEY

During the field survey, the BBARWA WWTP was observed as containing both historical and modern components, with the former sufficiently consistent in appearance to their late-1960s origin to warrant recordation and further study as a potential cultural resource. The entire plant was subsequently recorded into the California Historical Resources Inventory under the temporary designation of Site 3969-1H, pending assignment of a permanent identification number by the SCCIC. Site 3969-1H is discussed further below, and additional information is provided in the site record forms in Appendix 4.

Site 3969-1H occupies a peninsula jutting from the south shoreline of Lake Baldwin in the northeastern portion of the APE. As is typical for public utility facilities, the structures and other features at the plant are standard in design and utilitarian in character. Components original to its initial construction and still in use include two concrete balance chambers, settling ponds, an oval-shaped elevated berm/perimeter, two clarifiers (No. 1 and 2), rotors, and a clarifier splitter (Burton 2023). More recent components have been added to the facility beginning around 1974 and continuing through the 1990s and to at least 2011 (NETR Online 1969-2012; Google Earth 1995-2009; Burton 2023). Due to the alterations and additions since 1969, the overall appearance of the facility is predominantly modern.

No evidence of Site 36-002060, the previously recorded prehistoric lithic scatter, was found in the APE. Noted in 2004 as having been impacted by road and residential development near the intersection of Shay Road and Palomino Drive, the site at that time consisted of three lithic flakes located in an open area outside the current APE (Zavala 2004). The portion of the APE across the site lies entirely within the public right-of-way along Palomino Drive, where the surface and near-surface sediments have been extensively disturbed by road construction and underground utility installation. Consequently, it is highly unlikely for any archaeological features or artifact deposits

As noted above, many of the roadways within or across the APE trace their origins to the late historic period, and 14 of them were previously recorded into the California Historical Resources Inventory. As infrastructure features of historical origin that remain in service, however, the current configuration and appearance of these roadways reflect the results of upgrading and maintenance during the modern period, and none of them demonstrate any distinctive historical character today. The other cultural resource in the APE, Baldwin Lake (36-015027), was observed as having a relatively robust reach at the time of the field survey, inundating the western end and part of the northeastern portions of the BBARWA WWTP.

MANAGEMENT CONSIDERATIONS

APPLICABLE STATUTORY/REGULATORY GUIDELINES

The purpose of this study is to identify any "historic properties" or "historical resources" that may exist within the APE. "Historic properties," as defined by the Advisory Council on Historic Preservation, include "any prehistoric or historic district, site, building, structure, or object included in, or eligible for inclusion in, the National Register of Historic Places maintained by the Secretary of the Interior" (36 CFR 800.16(l)). The eligibility for inclusion in the National Register is determined by applying the following criteria, developed by the National Park Service as per provision of the National Historic Preservation Act:

> The quality of significance in American history, architecture, archaeology, engineering, and culture is present in districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association and
> (a) that are associated with events that have made a significant contribution to the broad patterns of our history; or
> (b) that are associated with the lives of persons significant in our past; or
> (c) that embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
> (d) that have yielded, or may be likely to yield, information important in prehistory or history. (36 CFR 60.4)

For CEQA-compliance considerations, the State of California's Public Resources Code (PRC) establishes the definitions and criteria for "historical resources," which require similar protection to what NHPA Section 106 mandates for "historic properties." "Historical resources," according to PRC §5020.1(j), "includes, but is not limited to, any object, building, site, area, place, record, or manuscript which is historically or archaeologically significant, or is significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California."

More specifically, CEQA guidelines state that the term "historical resources" applies to any such resources listed in or determined to be eligible for listing in the California Register of Historical Resources, included in a local register of historical resources, or determined to be historically significant by the lead agency (Title 14 CCR §15064.5(a)(1)-(3)). Regarding the proper criteria of historical significance, CEQA guidelines mandate that "generally a resource shall be considered by

the lead agency to be 'historically significant' if the resource meets the criteria for listing on the California Register of Historical Resources" (Title 14 CCR §15064.5(a)(3)). A resource may be listed in the California Register if it meets any of the following criteria:

(1) Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage.
(2) Is associated with the lives of persons important in our past.
(3) Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values.
(4) Has yielded, or may be likely to yield, information important in prehistory or history. (PRC §5024.1(c))

DISCUSSION

In summary, 17 historical/archaeological sites, including 1 prehistoric site, 15 historic-period site, and 1 natural feature that acquired cultural significance in both prehistory and history, were identified as lying within or partially within in the APE, as listed below:

Primary No.	Other Designation	Description
36-002060	CA-SBR-2060	Prehistoric lithic scatter
36-015027	CPHI No. SBr-014	Baldwin Lake
36-024007	CA-SBR-15192H	Division Drive
36-024051	CA-SBR-15236H	Bufflehead Drive
36-024052	CA-SBR-15237H	Teal Drive
36-024053	CA-SBR-15238H	Gold Mountain Drive
36-024054	CA-SBR-15239H	Mount Doble Drive
36-024059	CA-SBR-15244H	Arbor Lane
36-024547	CA-SBR-15588H	Shore Drive
36-024556	CA-SBR-15597H	Gildart Drive
36-024557	CA-SBR-15598H	Rose Hill Drive
36-024558	CA-SBR-15599H	Saw Mill Drive
36-024559	CA-SBR-15600H	Pinon Drive

Pending	3969-1H	BBARWA wastewater treatment plant

The prehistoric site, 36-002060, was first recorded in 1969 near the intersection of Shay Road and Palomino Drive, in an area that has since been developed into residential properties (NETR Online 1970-2020). During this study, no artifacts or features of prehistoric origin were observed in the portion of the site lying within the APE boundaries, which is confined in the public right-of-way of Palomino Drive. As stated above, in light of the extent of prior ground disturbance at this location, this study concludes that Site 36-002060 no longer exists within the APE.

Among 15 historic-period sites, 14 are segments of various public roadways that coincide with or cross the proposed pipeline alignments. As working components of the modern transportation infrastructure, these roadways have undergone extensive upgrading and maintenance work since the end of the historic period, and none of them demonstrate any distinctive historical character. All these roadways were built in the late historic period in accordance with standard designs and

construction practices. As such, none of them demonstrate any notable qualities in architecture, technology, or aesthetics, nor do they demonstrate the potential for any important historical/ archaeological data. Furthermore, there is no evidence that any of them is closely associated with any historic figures or events of recognized significance. Therefore, none of these 14 previously recorded roadways appear to meet any of the criteria for listing in the National Register of Historic Places or the California Register of Historical Resources, and none of them qualify as "historic properties" or "historical resources" under Section 106 and CEQA provisions.

Similarly, the BBARWA treatment plant (3969-1H) does not appear to be eligible for listing in the National Register or the California Register. Under Criterion A/1, the original construction of the plant dates to a period of rapid population growth in the Big Bear Valley area during the post-WWII suburban boom, which is arguably a pattern of events that substantially influenced the course of local, regional, as well as national history. However, as one of the numerous public utility projects completed at the time, the plant does not demonstrate a unique or particularly close association with this pattern of events or with any other historic theme. Furthermore, the plant is not known to be closely associated with any specific events of recognized significance in history.

Under Criterion B/2, the historical background research has not identified any important persons in association with the history of the BBARWA treatment plant. Under Criterion C/3, this utilitarian facility of standard design and construction does not exhibit any significant, special, or remarkable merits in architecture, engineering, technology, or aesthetics, nor does it represent an important example of any property type, period, region, and method of construction or embody the work of a prominent architect, engineer, or builder. Under Criterion D/4, the plant holds little promise for important historical or archaeological data for the study of public utility works in the post-WWII era, a subject that is well documented in existing literature and contemporary publications.

In addition, as a result of alterations and additions made in the modern period, the plant's historical components are now mixed with modern additions and replacements on prominent display. Consequently, it no longer retains sufficient historic integrity in the aspects of design, materials, workmanship, and feeling to relate to its early history. Based on these considerations, the BBARWA treatment plant does not appear to meet the definition of a "historic property" or a "historical resource."

The last cultural resource identified in the APE, Baldwin Lake (36-015027), has been designated a California Point of Historical Interest (No. SBr-014) due to its well-known association with colorful events in early California history and thus inherently qualifies as a "historical resource" under CEQA. Because of the same historical association, and because of its prominent role in local Native American creation story, Baldwin Lake may be considered eligible for the National Register of Historic Places upon full evaluation and thereby qualify as a "historic property" under Section 106 provisions as well. However, since the APE overlaps only a small portion of the lakebed at the BBARWA wastewater treatment plant and along the Palomino Drive and Baldwin Lake Trail rights-of-way, a full evaluation of the historical significance of Baldwin Lake is well beyond the scope of this study.

Given the limited involvement of the lakebed in the project plans and the previously altered cultural landscape in this portion of the APE, the proposed undertaking has little potential to affect the

existing characteristics of Baldwin Lake. Based on these considerations, the present study concludes that Baldwin Lake as a whole may be presumed to be a "historic property" for the purpose of this undertaking, with the understanding that the limited impact the undertaking may bring about to the current condition of the APE will not constitute an adverse effect on this "historic property"/ "historical resource."

CONCLUSION AND RECOMMENDATIONS

Section 106 of the National Historic Preservation Act mandates that federal agencies take into account the effects of their undertakings on historic properties and seek ways to avoid, minimize, or mitigate any adverse effects on such properties (36 CFR 800.1(a)). Similarly, CEQA establishes that a project that may cause a substantial adverse change in the significance of a "historical resource" is a project that may have a significant effect on the environment (PRC §21084.1). "Substantial adverse change," according to PRC §5020.1(q), "means demolition, destruction, relocation, or alteration such that the significance of an historical resource would be impaired."

In conclusion, among the 17 cultural resources identified in the APE, the 15 historic-period sites do not appear to qualify as "historic properties" or "historical resources," the prehistoric site (36-002060) is no longer extant within the APE boundaries, and the undertaking will not have an adverse effect on Baldwin Lake, a "historical resource" under CEQA and a presumed "historic property" under Section 106. Meanwhile, the subsurface sediments in the vertical APE appear to be relatively low in sensitivity for potentially significant archaeological deposits of prehistoric origin. Pursuant to 36 CFR 800.4(d)(1) and Calif. PRC §21084.1, CRM TECH presents the following recommendations to the BBARWA and the SWRCB:

- As currently proposed, the undertaking will not have an adverse effect on any "historic properties" or cause a substantial adverse change in the significance of any "historical resources."
- No further cultural resources investigation will be necessary for the undertaking unless project plans undergo such changes as to include areas not covered by this study.
- If buried cultural materials are discovered inadvertently during any earth-moving operations associated with the undertaking, all work in that area should be halted or diverted until a qualified archaeologist can evaluate the nature and significance of the find.

Re: Proposed Replenish Big Bear Program DEIR Project (CRM TECH No. 3969), San Bernardino County

Dear Ms. Gallardo:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information submitted for the above referenced project. The results were positive. Please contact the San Manuel Band of Mission Indians Tribal and Morongo Band of Mission Indians Council on the attached list for information. Please note that tribes do not always record their sacred sites in the SLF, nor are they required to do so. A SLF search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with a project's geographic area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites, such as the appropriate regional California Historical Research Information System (CHRIS) archaeological Information Center for the presence of recorded archaeological sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. Please contact all of those listed; if they cannot supply information, they may recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify the NAHC. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Cameron.vela@nahc.ca.gov.

Sincerely,

Cameron Vela

December 30, 2022

RE: Proposed Replenish Big Bear Program DEIR Project
Approximately 105 acres and 11.2 Linear Miles of Pipeline Alignment
In the Big Bear Valley, San Bernardino County, California
CRM TECH Contract #3969

Dear Tribal Representative:

I am writing to bring your attention to an ongoing CEQA-Plus study for the proposed project referenced above, which entails a series of improvements at various locations within the Big Bear Area Regional Wastewater Agency's (BBARWA) service district. The improvements include installation of approximately 11.2 linear miles pipelines along three alignments, development of solar evaporation ponds and other wastewater upgrades on approximately 105 acres within the BBARWA Lucerne facility, groundwater recharging development near the Sand Canyon Channel, creation of three discharge areas along the lake side of Division Drive and within the Shay Pond site, and the installation of a new pump/booster station. The accompanying maps, based on the USGS Big Bear City, Big Bear Lake, Fawnskin, and Moonridge, Calif., 7.5' quadrangles, depict the undertaking's Area of Potential Effects (APE) within Sections 10-15 and 26, T2N R1E, and Sections 7 and 18, T2N R2E, SBBM.

The Native American Heritage Commission reports in a letter dated December 16, 2022, that the results of the Sacred Lands File search were positive and recommends that the Morongo Band of Mission Indians and the Yuhaaviatam of San Manuel Nation (formerly known as San Manuel Band of Mission Indians), as well as local tribes, be contacted for further information (see attached). Therefore, as part of the cultural resources study for this project, I am writing to request your input on potential Native American cultural resources in or near the APE. Any information or concerns may be forwarded to CRM TECH by telephone, e-mail, facsimile, or standard mail. Requests for documentation or information we cannot provide will be forwarded to our client and/or the lead agencies, namely the Big Bear Area Regional Wastewater Agency, but the State Water Resource Control Board will be overseeing the project as well.

We would also like to clarify that, as the cultural resources consultant for the project, CRM TECH is not involved in the AB 52-compliance process or in government-to-government consultations. The purpose of this letter is to seek any information that you may have to help us determine if there are cultural resources in or near the project area that we should be aware of and to help us assess the sensitivity of the APE. Thank you for your time and effort in addressing this important matter.

Respectfully,

Nina Gallardo
CRM TECH Project Archaeologist/Native American liaison

RE: Proposed Replenish Big Bear Program DEIR Project Approximately 105 acres and 11.2 Linear Miles of Pipeline Alignment In the Big Bear Valley, San Bernardino County, California CRM TECH Contract #3969

Dear: Nina Gallardo
Project Archaeologist/Native American liaison

Thank you for the opportunity to offer input concerning the development of the above-identified project. We appreciate your sensitivity to the cultural resources that may be impacted by your project and the importance of these cultural resources to the Native American peoples that have occupied the land surrounding the area of your project for thousands of years. Unfortunately, increased development and lack of sensitivity to cultural resources have resulted in many significant cultural resources being destroyed or substantially altered and impacted. Your invitation to consult on this project is greatly appreciated.

At this time, we are unaware of specific cultural resources that may be affected by the proposed project, however, in the event, you should discover any cultural resources during the development of this project please contact our office immediately for further evaluation.

Very truly yours,

Victoria Martin

Victoria Martin, Tribal Vice-Chairperson

Subject: RE: NA Scoping Letter for the Proposed Replenish Big Bear Program DEIR Project in the Big Bear Valley, San Bernardino County (CRM TECH #3969)

Dear Ms. Gallardo,

The Morongo Band of Mission Indians (Tribe/MBMI) Tribal Historic Preservation Office is in receipt of your letter regarding the above referenced project. Thank you for reaching out to Tribe at an early stage. The proposed Project (Project) is located within the ancestral territory and traditional use area of the Cahuilla and Serrano people of the Morongo Band of Mission Indians.

Tribal cultural resources are non-renewable resources and therefore of high importance to the Morongo Tribe and tribal participation (a.k.a. tribal monitors) is recommended during the future construction phases(s) of the Project. We look forward to working with the Lead Agency of and your company to protect these irreplaceable resources out of respect for ancestors of the Morongo people who left them there, and for the people of today and for generations to come.

Projects within this area are highly sensitive for cultural resources regardless of the presence or absence of remaining surface artifacts and features. At the appropriate stage of the Project, our office will request government-to-government consultation under Assembly Bill (AB) 52 (California Public Resources Code §21080.3.1) with the Lead Agency. At that time, the following will be requested from the Lead Agency to ensure meaningful consultation:

* A records search conducted at the appropriate California Historical Resources Information System (CHRIS) center with at least a 1.0-mile search radius from the project boundary. If this work has already been done, please furnish copies of the cultural resource documentation (reports and site records) generated through this search so that we can compare and review with our records to begin productive consultation
* Tribal participation (a.k.a. tribal monitors) during the pedestrian survey and testing, if this fieldwork has not already taken place. In the event that archaeological crews have completed this work, our office requests a copy of the current Phase I study or other cultural assessments (including the cultural resources inventory)
* Shape files of the Projects area of effect (APE)
* Geotechnical Report
* Currently proposed Project design and Mass

This letter neither initiates nor concludes consultation. Upon the invitation for consultation from the lead agency and receipt of the requested documents, the MBMI THPO may further provide recommendations and/or mitigation measures.

Please keep in mind that MBMI requests that copies of all cultural data such as reports and confidential data (DPRs) and confidential portions of reports be sent to Tribal THPO. The lead contact for this Project is Bernadette Ann Brierty, Tribal Historic Preservation Officer (THPO).

Cultural Resource Specialist Laura Chatterton will be assisting the Tribe in the review of this project. Should you have any questions, please do not hesitate to contact us at lchatterton@morongo-nsn.gov, thpo@morongo-nsn.gov, ABrierty@morongo-nsn.gov, or (951) 663-2842. The Tribe looks forward to meaningful government-to-government consultation with the Lead Agency.

Respectfully,

Laura Chatterton

Permanent Trinomial: CA-SBR-2060 Supplement [XX]

Temporary Number: SBCM-234 and/or 604

Page 1 of 34.

Agency Designation:

1. County: San Bernardino County

2. USGS Quad: Big Bear City (7.5') XXXXX (15') Photorevised 1979

3. UTM Coordinates: Zone 11 / multiple - see list below Easting / Northing ( )

4. Township 2N Range 2E S½ SE ¼ of SE ¼ of SE SW ¼ of SW SE ¼ of Section 7 Base (Mer.) SBM ( )

5. Map Coordinates: 505 mmS 235 mmN (from NW corner of map) 6. Elevation 6726'

7. Location: Scatter of artifacts noted in the area to the northwest of the intersection of Shay Road and Palomino Drive. Scatter is likely to continue to the east of Palomino Drive, in the undeveloped field, and into the property to the west (see McKenna 1989) ( )

8. Prehistoric XXXX Historic Protohistoric 9. Site Description: Lithic artifacts: small waste flakes, a few scrapers, miscellaneous primary flakes, at least one projectile point noted ont he surface. Area is highly overgrown and mush of the ground is obscured. Other artifacts are likely to be in the subsurface context (see Charles-Fincher 1980) ( )

10. Area: 100 m(length) x 100 m(width) 10,000 m². Method of Determination: pacing. It is likely that this scatter is more widely dispersed than indicated here. ( )

11. Depth: 50cm+ cm Method of Determination: from Charles-Fincher notes ( )

12. Features: not observed, but records of buried living surface at 30cm+ (reported by Charles-Fincher 1980). ( )

13. Artifacts: flakes, scrapers, primary flakes, one projectile point. Point has been tentatively identified as an Elko Eared Projectile Point (Warren et.al. 1984; Binning et.al. 1986). ( )

14. Non-Artifactual Constitutients: Natural growth of pine and sage brush cover property. Likely location for early lumbering industry. ( )

15. Date Recorded: July 25, 1989 16. Recorded By: Jeanette A. McKenna ( )

17. Affiliation and Address: McKenna et.al., Whittier, California (213)696-3852 ( )

County San Bernardino | Name Baldwin Lake

Location The upper (eastern) end of Bear Valley, in the San Bernardino Mountains.

Historical Significance: Shallow and marshy, Baldwin Lake was the only large natural lake in the San Bernardino Mountains when Benjamin Wilson reached it in 1845. Wilson had been sent with a contingent of soldiers by Pio Pico to punish the desert Indians who had been raiding Mexican stock ranches in southern California. Sending most of the soldiers and the supply train via Cajon Pass, Wilson took 22 men up Santa Ana Canyon into the mountains. Reaching the lake, which was swarming with grizzlies, they named it Bear Lake. The Californios killed 11 bears, using their lassoes. Proceding north down into the desert, Wilson met the rest of his party along the Mojave River, attacked the Indians, and killed their leader. Unable to follow the Indians farther, they withdrew and returned to Jurupa Rancho, Wilson and his 22 again via the lake, where they killed 11 more bears.

When Bear Valley Dam was built in the 1880s, the name Bear Lake was transferred to the new reservoir, and the natural lake was renamed Baldwin Lake, after "Lucky" Baldwin, owner of the Gold Mine nearby to the northwest.

THIS POINT OF HISTORICAL INTEREST IS NOT A STATE REGISTERED HISTORICAL LANDMARK.

d. UTM: Zone 11; 512402 mE/ 3790848 mN NAD27 GPS

e. Other Locational Data:

Division Drive lies at the western edge of Big Bear City and the eastern edge of the community of Big Bear Lake. The street intersects Highway 18 at postmile 52.7.

***P3a. Description:**

This site is a paved, historical-period road called Division Drive. This road is paved with asphalt, and the directions of travel are separated by a double yellow line. Each of the two lanes, one in each direction, is slightly wider than a normal residential street, and defined dirt shoulders line the road. At the road's intersection with Highway 18 there is a traffic light. The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this site.

*A4. Features:

Feature 9187 is a paved, historical-period road called Division Drive. This road is paved with asphalt, and the directions of travel are separated by a double yellow line. Each of the two lanes, one in each direction, is slightly wider than a normal residential street, and defined dirt shoulders line the road. At the road's intersection with Highway 18 there is a traffic light. The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

*A5. Cultural Constituents:

No artifacts were observed.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☑ Good ☐ Fair ☐ Poor

The road is in good condition and has been maintained. It has, however, been imapcted over time by widening, and possibly grading.

*A8. Nearest Water: The nearest water is Big Bear Lake, located approximately 1/4 mile northwest of the site.

*A9. Elevation: 2063 m amsl

A10. Environmental Setting:

The road is situated within Bear Valley and is near Big Bear Lake. The area is a deep depression within the San Bernardino Mountains, where at one time there were two lakes, but now only one is filled with water. Vegetation in the area of the site consists entirely of planted species of trees, mainly conifers but also various deciduous trees and tropical flowers.

A11. Historical Information:

The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

L2b. Location of Point or Segment:
Zone 11; 512402 mE/ 3790824 mN NAD27 GPS
Zone 11; 512402 mE/ 3790872 mN NAD27 GPS

L3. Description:
Feature 9187 is a paved, historical-period road called Division Drive. This road is paved with asphalt, and the directions of travel are separated by a double yellow line. Each of the two lanes, one in each direction, is slightly wider than a normal residential street, and defined dirt shoulders line the road. At the road's intersection with Highway 18 there is a traffic light. The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

L4. Dimensions:
- **a. Top Width:** 14.00 m
- **b. Bottom Width:** N/A
- **c. Height or Depth:** None
- **d. Length of Segment:** 15.00 m

e. Other Locational Data:
Teal Drive is located in Big Bear City along Highway 38 at postmile 48.6.

*P3a. Description:
This site is an asphalt-paved, historical-period road wide enough for a single lane of traffic to pass in each direction. The pavement is unmarked by paint, but the intersection is marked, outside the right-of-way, by a stop sign and street name sign. The road, known as Teal Drive is a north-to-south-oriented residential street which intersects Highway 38 from the north.

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

A2. Depth: None ☑ None ☐ Unknown Method of determination: None

*A3. Human Remains: ☑ Present ☐ Absent ☐ Possible ☐ Unknown

*A4. Features:

The only feature associated with this site is an asphalt-paved, historical-period road (Feature 8628) wide enough for a single lane of traffic to pass in each direction. The pavement is unmarked by paint, but the intersection is marked, outside the right-of-way, by a stop sign and street name sign. The road, known as Teal Drive is a north-to-south-oriented residential street which intersects Highway 38 from the north.

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

*A5. Cultural Constituents:

No cultural material is associated with this feature.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☐ Good ☑ Fair ☐ Poor

This site likely was once a dirt road and has since been paved and graded. In addition, the pavement now shows signs of weathering, being cracked and faded.

*A8. Nearest Water: The nearest water source to Teal Drive is Big Bear Lake, located approximately 2 miles away to ...

*A9. Elevation: 2057 m amsl

A10. Environmental Setting:

The site is set within Bear Valley, a deep valley in the San Bernardino Mountains. The site is positioned just south of a steep but short rise and along a gentle slope down to the north. Surrounding vegetation conists of pine trees, scrub brush and grasses, but the area generally has a semi-desert-like feel.

A11. Historical Information:

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

A1. Method of determination
pavement for Mount Doble Drive. The site boundary is also determined in part by the right-of-way established by Caltrans. The right-of-way extends 15 m from the edge of the pavement. The site continues beyond the right-of-way, but these portions were not recorded.

L3. Description
The site appears on the 1947 Lucerne Valley 15-minute topographic quad map. No artifacts were associated with the site.

Arbor Lane meets and crosses Highway 38 near postmile 54.35 within Big Bear City's northern section.

*P3a. Description:
This site is a two-lane, asphalt-paved street oriented east to west called Arbor Lane. This road intersects Highway 38 from both sides. At this intersection, the road features white painted stop lines and the word "STOP" on the asphalt. The shoulders are sandy/dirty on both sides of the road at its intersection with Highway 38. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded.The site also appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. No artifacts were encountered associated with this site.

Shore Drive is located in Big Bear City, at postmile 48.7 along Highway 38.

*P3a. Description:
The only feature associated with this site consists of an asphalt-paved, historical-period road that is wide enough for a single lane of traffic to pass in each direction. White paint on the asphalt at the junction with the highway delinates the stop point. The asphalt is generally in good condition, although a few cracks are apparent, and the pavement has faded as well. The road, known as Shore Drive, is a north-to-south-oriented residential street in Big Bear City, which leads from Highway 38 to the shore of the former (now largely dry) Lake Baldwin. Shore Drive is located on both sides of Highway 38.

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this site.

Method of Measurement: ☐ Paced ☐ Taped ☐ Visual estimate ☑ GPS ☐ Other:
Method of Determination: ☐ Artifacts ☑ Features ☐ Soil ☐ Vegetation ☐ Topography ☐ Cut bank ☐ Animal burrow ☐ Excavation ☐ Property boundary ☑ Other: The site boundary is determined in part by the right-of-way established ...
Reliability of determination: ☑ High ☐ Medium ☐ Low
Explain: Because the site was well-maintained with proper signage, the site boundaries were readily apparent.
Limitations: ☐ Restricted access ☐ Paved/built over ☑ Site limits incompletely defined ☐ Disturbances ☐ Vegetation ☐ Other:

A2. Depth: None ☑ None ☐ Unknown Method of determination: None

*A3. Human Remains: ☐ Present ☑ Absent ☐ Possible ☐ Unknown

*A4. Features:

The only feature associated with this site consists of an asphalt-paved, historical-period road (Feature 8631) wide enough for a single lane of traffic to pass in each direction. White paint on the asphalt at the junction with the highway delineates the stop point. The asphalt is generally in good condition, although a few cracks are apparent, and the pavement has faded as well. The road, known as Shore Drive, is a north-to-south-oriented residential street in Big Bear City, which leads from Highway 38 to the shore of the former (now largely dry) Lake Baldwin. Shore Drive is located on both sides of Highway 38.

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

*A5. Cultural Constituents:

No cultural material is associated with this site.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☐ Good ☑ Fair ☐ Poor

The effects of weathering are, however, apparent in that a few cracks are visible in the asphalt.

*A8. Nearest Water: Big Bear Lake, the nearest water source, is located approximately 2 miles from this road.

*A9. Elevation: 2060 m amsl

A10. Environmental Setting:

This site is set within the Bear Valley, a deep valley in the San Bernardino Mountains. The road slopes to the north, while to its south, across the highway, a hill rises up. To the site's immediate west is a wooded area with numerous pine trees, grass, and shrubs.

A11. Historical Information:

The site was identified on the Lucerne Valley (1947) 15-minute USGS topographic quad.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

Although no center lines are painted on the road surface, the word "Stop" and a line appears in white at both the north and southbound intersections with Highway 18. This site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

L4. Dimensions:
a. Top Width: 9.00 m
b. Bottom Width: N/A
c. Height or Depth: None
d. Length of Segment: 15.00 m

L5. Associated Resources:
None

L4e. Sketch of Cross-Section: **Facing:**

L6. Setting:
The road is situated in the Bear Valley depression within the San Bernardino Mountains. Vegetation is mainly planted coniferous trees such as Ponderosa pines, along with nonnative grass. The topography consists of a gentle slope running down to the north.

L7. Integrity Considerations:
The site does not appear to have been disturbed other than by repaving, which covered or destroyed historical-period road surfaces.

Method of Determination: ☐ Artifacts ☑ Features ☐ Soil ☐ Vegetation ☐ Topography ☐ Cut bank ☐ Animal burrow ☐ Excavation ☐ Property boundary ☑ Other: The site boundary is determined in part by the right-of-way established ...
Reliability of determination: ☑ High ☐ Medium ☐ Low
Explain: As a paved road, the boudnaries of this site were clear and discernable from surroundings.
Limitations: ☐ Restricted access ☐ Paved/built over ☑ Site limits incompletely defined ☐ Disturbances ☐ Vegetation ☐ Other:

A2. Depth: None ☑ None ☐ Unknown Method of determination: None

*A3. Human Remains: ☐ Present ☑ Absent ☐ Possible ☐ Unknown

*A4. Features:
The site consists of a paved, two-lane road called Rose Hill Drive (Feature 10016). This road is oriented north to south and intersects Highway 38 from both sides. Although there are not center lines on the road surface, the word "Stop" is painted in white at the intersection of the road and Highway 18. The road provides access to several modest residences in Big Bear City. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way,but these portions were not recorded. The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. No cultural material is associated with this feature.

*A5. Cultural Constituents:
No cultural material is associated with this site.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☑ Good ☐ Fair ☐ Poor
No disturbances are readily apparent.

*A8. Nearest Water: The nearest water to this site is Big Bear Lake, located approximately 1800 meters west of the site.

*A9. Elevation: 2061 m amsl

A10. Environmental Setting:
The setting of this site is within a large basin in the San Bernardino Mountains, which features two natural lakes. The environment is more like high desert than mountain forest, however. This is due to the fact that the basin of Bear Valley sits on the northern side of the mountains, in a rain shadow. Vegetation in this urban area is entirely planted, and consists of conifers, grass and birch trees.

A11. Historical Information:
The site appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

A13. Interpretations:
Rose HIll Drive is a residential street leading to modest homes in Big Bear City. The houses visible from Highway 18 do not appear older than the 1950's or, at earliest, 1940's.

L2b. Location of Point or Segment:
Zone 11; 513802 mE/ 3790899 mN NAD27 GPS
Zone 11; 513802 mE/ 3790937 mN NAD27 GPS

L3. Description:
The site consists of a two-lane, paved road called Pinon Drive (Feature 10032). This road is oriented north to south and intersects Highway 18 from both sides. Although no traffic lines appear on the pavement, the word "Stop" and a white line are painted on each side of the road's intersection with Highway 18. The road provides access to several residences in Big Bear City. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. No cultural material is associated with this feature.

L4. Dimensions:
a. Top Width: 8.00 m
b. Bottom Width: N/A
c. Height or Depth: None
d. Length of Segment: 39.00 m
L5. Associated Resources:
None

L4e. Sketch of Cross-Section: **Facing:**

L6. Setting:
The site is located in Bear Valley in the San Bernardino Mountains. Vegetation is planted in pine trees predominately along with grasses and shrubs.

L7. Integrity Considerations:
No disturbances were observed.

The site continues beyond the right-of-way, but these portions were not recorded. The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. No cultural material is associated with this feature.

*A5. Cultural Constituents:
No artifacts were encountered.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☑ Good ☐ Fair ☐ Poor
No site disturbances were observed. It is possible, however, that the road was not originally paved, in which case the pavement would be a disturbance.

*A8. Nearest Water: The nearest water is Big Bear Lake, located approximately 1400 meters west of the site.

*A9. Elevation: 2060 m amsl

A10. Environmental Setting:
The site is set in the Bear Valley of the San Bernardino Mountains. The valley is relatively dry, despite the presence of one lake. The climate and soils are more like that of the high desert to the north than the south face of the mountains, which are cooler and wetter. Vegetation consists primarily of coniferous trees and various non-native plants.

A11. Historical Information:
The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

A13. Interpretations:
This road is residential and provides access to the city's airport, located at the road's northern terminus.

Reliability of determination: ☑ High ☐ Medium ☐ Low
Explain: Because the site is relatively well-maintained, the site boundaries are readily apparent.
Limitations: ☐ Restricted access ☐ Paved/built over ☑ Site limits incompletely defined ☐ Disturbances ☐ Vegetation ☐ Other:

A2. Depth: ☐ None ☑ Unknown Method of determination: Subsurface testing was not conducted.

*A3. Human Remains: ☐ Present ☑ Absent ☐ Possible ☐ Unknown

*A4. Features:

The site consists of three features: an asphalt-paved road called Pine View Drive (Feature 10062); a bronze survey benchmark (Feature 10067); and a concrete culvert into which the benchmark is set (Feature 10068).

Pine View Drive is a narrow, two-lane road with no shoulders oriented north to south on both sides of Highway 18. This road grades slightly up at these intersections to meet the level of the highway. No traffic lines are painted on the asphalt, but the word "Stop" and a stop line are painted in white at the intersection with Highway 18. The road is visible on the 1947 Lucerne Valley USGS 15-minute topographic quad map.

The benchmark is bronze, 3 inches in diameter, and bears the inscription U.S. Coastal and Geodetic Survey / 1956/ Pentaly for Removal. The benchmark is set into a concrete culvert. The concrete for the culvert was poured in place into a form, as the marks of form boards are present on its south side. It has a box form and directs water directly in and through it, rather than being the support for a corrugated pipe as is often the case. The culvert is 15 1/2 feet long (east to west).

The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. No cultural material is associated with this feature.

*A5. Cultural Constituents:

No cultural material is associated with this site.

*A6. Were Specimens Collected? ☑ No ☐ Yes

*A7. Site Condition ☑ Good ☐ Fair ☐ Poor

No site disturbances were observed.

*A8. Nearest Water: The nearest water is Big Bear Lake, located approximately 800 meters northwest of this site. ...

*A9. Elevation: 2068 m amsl

A10. Environmental Setting:

Ths site is located in Bear Valley, a deep basin in the San Bernardino Mountains. The valley supports pine and scrub naturally. Within the city, however, residents have planted a wide array of trees and shrubs while non-native grasses have invaded or been planted in many places.

A11. Historical Information:

The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. The benchmark has a date of 1956 on it which means that, if original, the concrete culvert must also date to that year.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

A13. Interpretations:

This road serves as a residential road. The culvert brings water from the slopes to the south of the highway underneath it and thence presumably to the lake or a water treatment facility. The survey marker is a remnant of the first half twentieth century surveying program done by the U.S. Coastal and Geodetic Survey, a function later taken over by other agencies of the federal government.

*A8. Nearest Water: The nearest water is a small drainage that crosses Highway 18, one block east of the site. ...

*A9. Elevation: 2066 m amsl

A10. Environmental Setting:
This site is set within Bear Valley, a large basin within the northern side of the San Bernardino Mountains. The north side receives less rain, and consequently exhibits somewhat desert-like conditions. This is despite the lake and the snowy ridges above the valley to the south. The topography of the valley bottom is flat, while the site itself slopes gently northward. Vegetation consists of planted Ponderosa pines, hardwoods and intrusive grasses.

A11. Historical Information:
The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map.

*A12. Age: ☐ Prehistoric ☐ Protohistoric ☐ 1542-1769 ☐ 1769-1848 ☐ 1848-1880 ☐ 1880-1914 ☐ 1914-1945 ☑ Post-1945 ☐ Undetermined

A13. Interpretations:
Holcomb View Drive is a residential street near the edge of Big Bear City.

A14. Remarks:

Zone 11; 512897 mE/ 3790863 mN NAD27 GPS

L3. Description:
The site consists of an asphalt-paved, two-lane road called Holcomb View Drive (Feature 10070). The road intersects Highway 18 from the north and south. At these intersections, the word "Stop" and a stop line are painted in white. No other pavement surface markers are visible. The current project only examines the first 15 meters from the edge of pavement corresponding to the Caltrans right-of-way. The site continues beyond the right-of-way, but these portions were not recorded. The road appears on the 1947 Lucerne Valley USGS 15-minute topographic quad map. No cultural material is associated with this feature.

L4. Dimensions:
a. Top Width: 9.00 m
b. Bottom Width: N/A
c. Height or Depth: None
d. Length of Segment: 39.00 m
L5. Associated Resources:

B1. Historic Name: Big Bear Area Regional Wastewater Agency (BBARWA) treatment plant

B2. Common Name: Same

B3. Original Use: Wastewater treatment B4. Present Use: Same

***B5. Architectural Style:** N/A

***B6. Construction History:** (Construction date, alterations, and date of alterations) Construction of this wastewater treatment plant began in 1966 with the two balance chambers, a horseshoe pond, and a berm around the facility. In April 1974 Clarifiers #1 and #2, rotors, and possibly the Clarifier Splitter were added. By 1980 Oxidation Ditches #1 and #2 were present, and the Operations and Control Building and sand beds were under construction to be completed by 1981. By 1995 the clarifiers were covered by the metallic domes currently in place. By 2002 the horseshoe pond was shortened and divided by a causeway, creating the two-pond configuration today. As a result, the balance chambers and the perimeter berm are the only relatively unaltered elements of the original 1966 construction.

***Date:** April 28, 2023 √ Continuation Update

***P3a. Description (continued):** containing the wastewater treatment elements, forming a 3/4 oval measuring approximately 0.56 miles along (east-west) and 0.22 miles wide (north-south). The maximum height of the berm is approximately 5', but the height is inconsistent, likely due to erosion as several segments of the berm are currently underwater. The 1966 earthen horseshoe pond was approximately 830' long (east-west) and 320' wide (north-south) with a 625'-long causeway partially bisecting the pond from east to west. In the modern period the pond was shortened by 385', thereby dividing it into two ponds measuring 425' x 125', which were then lined with concrete. The balance chambers are two concrete-lined pits measuring approximately 190' long (east-west) and 20' wide (north-south) with a depth of several feet. The clarifiers, measuring 75' across, were covered with geodesic metallic domes in the modern era and thus obscured from exterior view.

***B10. Significance: (continued):** Big Bear Valley area during the post-WWII suburban boom, which is arguably a pattern of events that substantially influenced the course of local, regional, as well as national history. However, as one of the numerous public utility projects completed at the time, the plant does not demonstrate a unique or particularly close association with this pattern of events or with any other historic theme. Furthermore, the plant is not known to be closely associated with any specific events of recognized significance in history.

Under Criterion B/2, the historical background research has not identified any important historic figures in association with the BBARWA treatment plant. Under Criterion C/3, this utilitarian facility of standard design and construction does not exhibit any significant, special, or remarkable merits in architecture, engineering, technology, or aesthetics, nor does it represent an important example of any property type, period, region, and method of construction or embody the work of a prominent architect, engineer, or builder. Under Criterion D/4, the plant holds little promise for important historical or archaeological data for the study of public utility works in the post-WWII era, a subject that is well documented in existing literature and contemporary publications.

In addition, as a result of alterations and additions made in the modern period, the plant's historical components are now mixed with modern additions and replacements on prominent display. Consequently, it no longer retains sufficient historic integrity in the aspects of design, materials, workmanship, and feeling to relate to its early history.

EXECUTIVE SUMMARY

ES.1 SUMMARY OF FINDINGS

The results of this *Replenish Big Bear Program Energy Analysis* is summarized below based on the significance criteria in Section 5 of this report consistent with Appendix G of the California Environmental Quality Act (CEQA) Statute and Guidelines (*CEQA Guidelines*) (1). Table ES-1 shows the findings of significance for potential energy impacts under CEQA.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Energy Impact #1: Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?	5.0	*Less Than Significant*	*n/a*
Energy Impact #2: Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?	5.0	*Less Than Significant*	*n/a*

ES.2 PROJECT REQUIREMENTS

The Project would be required to comply with regulations imposed by the federal and state agencies that regulate energy use and consumption through various means and programs. Those that are directly and indirectly applicable to the Project and that would assist in the reduction of energy usage include:

- Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA)
- The Transportation Equity Act for the 21st Century (TEA-21)
- Integrated Energy Policy Report (IEPR)
- State of California Energy Plan
- California Code Title 24, Part 6, Energy Efficiency Standards
- California Code Title 24, Part 11, California Green Building Standards Code (CALGreen)
- AB 1493 Pavley Regulations and Fuel Efficiency Standards
- California's Renewable Portfolio Standard (RPS)
- Clean Energy and Pollution Reduction Act of 2015 (SB 350)

Consistency with the above regulations is discussed in detail in section 5 of this report.

This page intentionally left blank

1 INTRODUCTION

This report presents the results of the energy analysis prepared by Urban Crossroads, Inc., for the proposed Replenish Big Bear Program Project (Project). The purpose of this report is to ensure that energy implication is considered by the Big Bear Area Regional Wastewater Agency (Lead Agency), as the lead agency, and to quantify anticipated energy usage associated with construction and operation of the proposed Project, determine if the usage amounts are efficient, typical, or wasteful for the land use type, and to emphasize avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

1.1 SITE LOCATION

The Project site is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake are located in the middle of this Basin. The overall project area consists of the Valley in the County of San Bernardino, as shown on Exhibit 1-A.

1.2 PROJECT DESCRIPTION

The proposed Project includes upgrades and additions to Big Bear Area Regional Wastewater Agency's (BBARWA) wastewater treatment plant (WWTP) to produce purified water through full advanced treatment to protect the receiving waters and their beneficial uses. The Replenish Big Bear Program would upgrade BBARWA's WWTP to produce full advanced treated water that would be retained within the Big Bear Valley watershed to be used to increase the sustainability of local water supplies, consequently, wastewater currently delivered to Lucerne Valley will be modified. The proposed Project consists of construction and operation of the various facilities which are separated into five project categories: 1) Replenish Big Bear Component 1: Lake Discharge Pipeline Alignment; 2) Replenish Big Bear Component 2: Shay Pond; 3) Replenish Big Bear Component 3: Evaporation Pond; 4) Replenish Big Bear Component 4: BBARWA WWTP Upgrades; and 5) Replenish Big Bear Component 5: Sand Canyon.

This Replenish Big Bear Component includes upgrades to the BBARWA WWTP, to include 2.2 MGD of full advanced treatment, producing up to 2,210 AFY of purified water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the solar evaporation ponds. Additionally, the BBARWA WWTP Treatment Upgrades also includes

installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump purified water to Shay Pond and Stanfield Marsh.

REPLENISH BIG BEAR COMPONENT 2: LAKE DISCHARGE PIPELINE ALIGNMENT

The Replenish Big Bear Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

REPLENISH BIG BEAR COMPONENT 3: SHAY POND CONVEYANCE PIPELINE

The Replenish Big Bear Program would ultimately install about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

REPLENISH BIG BEAR COMPONENT 4: EVAPORATION POND

The Replenish Big Bear Program would include between 23 and 57 acres of evaporation ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to 2 monitoring wells.

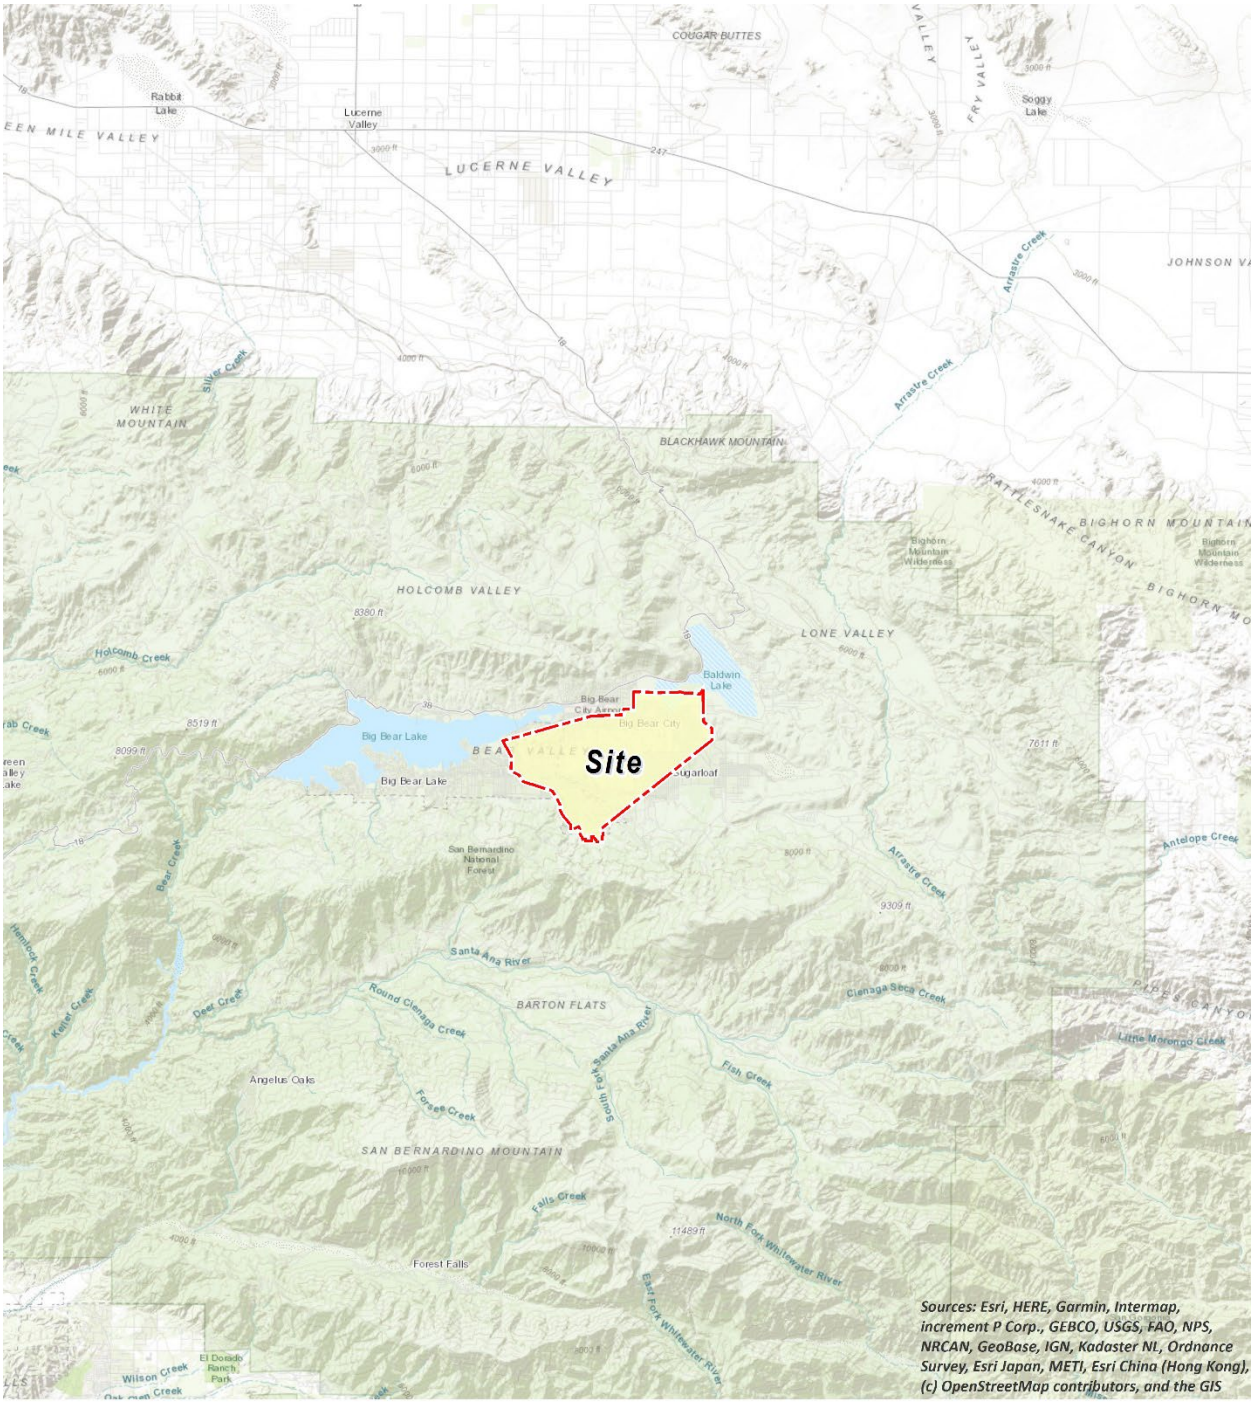
REPLENISH BIG BEAR COMPONENT 5: SAND CANYON

The Sand Canyon groundwater recharge project involves extracting Project water stored in the Lake to a temporary storage pond using existing infrastructure owned by a local resort. The Project water will then be pumped and conveyed to the Sand Canyon recharge area using a new pump station and pipeline.

As part of the Replenish Big Bear Program, the following will be constructed:

- A new 471 gpm pump station near the snowmaking pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

EXHIBIT 1-A: PROJECT LOCATION MAP



This page intentionally left blank

2 EXISTING CONDITIONS

This section provides an overview of the existing energy conditions in the Project region.

2.1 OVERVIEW

The most recent data for California's estimated total energy consumption and natural gas consumption is from 2020, released by the United States (U.S.) Energy Information Administration's (EIA) California State Profile and Energy Estimates in 2021 and included (2):

- As of 2020, approximately 6,923 trillion British Thermal Unit (BTU) of energy was consumed
- As of 2021, approximately 605 million barrels of petroleum
- As of 2021, approximately 2,101 billion cubic feet of natural gas
- As of 2021, approximately 1 million short tons of coal

According to the EIA, in 2021 the U.S. petroleum consumption comprised about 77% of all transportation energy use, excluding fuel consumed for aviation and most marine vessels (3). In 2022, about 251,923 million gallons (or about 5.99 million barrels) of finished petroleum products were consumed in the U.S., an average of about 690 million gallons per day (or about 16.4 million barrels per day) (4). In 2021, California consumed approximately 12,157 million gallons in motor gasoline (33.31 million per day) and approximately 3,541 million gallons of diesel fuel (9.7 million per day) (5).

The most recent data provided by the EIA for energy use in California is reported from 2021 and provided by demand sectors as follows:

- Approximately 37.8% transportation sector
- Approximately 23.2% industrial sector
- Approximately 20.0% residential sector
- Approximately 19.0% commercial sector (6)

According to the EIA, California used approximately 247,250 gigawatt hours of electricity in 2021 (7). By sector in 2021, residential uses utilized 36.5% of the state's electricity, followed by 43.9% for commercial uses, 19.2% for industrial uses, and 0.3% for transportation. Electricity usage in California for differing land uses varies substantially by the type of uses in a building, type of construction materials used in a building, and the efficiency of all electricity-consuming devices within a building (7).

According to the EIA, California used approximately 200,871 million therms of natural gas in 2021 (8). In 2021 (the most recent year for which data is available), by sector, industrial uses utilized 33% of the state's natural gas, followed by 30% used as fuel in the electric power sector, 21% from residential, 11% from commercial, 1% from transportation uses and the remaining 3% was utilized for the operations, processing and production of natural gas itself (8). While the supply of natural gas in the United States and production in the lower 48 states has increased greatly since 2008, California produces little, and imports 90% of its supply of natural gas (9).

In 2022, total system electric generation for California was 287,220 gigawatt hours (GWh). California's massive electricity in-state generation system generated approximately 203,257 GWh which accounted for approximately 71% of the electricity it uses; the rest was imported from the Pacific Northwest (12%) and the U.S. Southwest (17%) (10). Natural gas is the main source for electricity generation at 47.46% of the total in-state electric generation system power as shown in Table 2-1.

An updated summary of, and context for energy consumption and energy demands within the State is presented in "U.S. Energy Information Administration, California State Profile and Energy Estimates, Quick Facts" excerpted below (11):

- In 2022, California was the seventh-largest producer of crude oil among the 50 states, and, as of January 2022, the state ranked third in crude oil refining capacity.
- California is the largest consumer of jet fuel and second-largest consumer of motor gasoline among the 50 states.
- In 2020, California was the second-largest total energy consumer among the states, but its per capita energy consumption was less than in all but three other states.
- In 2022, renewable resources, including hydroelectric power and small-scale, customer-sited solar power, accounted for 49% of California's in-state electricity generation. Natural gas fueled another 42%. Nuclear power supplied almost all the rest.
- In 2022, California was the fourth-largest electricity producer in the nation. The state was also the nation's third-largest electricity consumer, and additional needed electricity supplies came from out-of-state generators.

As indicated below, California is one of the nation's leading energy-producing states, and California's per capita energy use is among the nation's most efficient. Given the nature of the Project, the remainder of this discussion will focus on the three sources of energy that are most relevant to the Project—namely, electricity, natural gas, and transportation fuel for vehicle trips associated with the uses planned for the Project.

TABLE 2-1: TOTAL ELECRICITY SYSTEM POWER (CALIFORNIA 2022)

Fuel Type	California In-State Generation (GWh)	% of California In-State Generation	Northwest Imports (GWh)	Southwest Imports (GWh)	Total Imports (GWh)	Total California Energy Mix (GWh)	Total California Power Mix
Coal	273	0.13%	181	5,716	5,897	6,170	2.15%
Natural Gas	96,457	47.46%	44	7,994	8,038	104,495	36.38%

2.2 ELECTRICITY

The usage associated with electricity use were calculated using the California Emissions Estimator Model (CalEEMod) Version 2022.1.1.12. The Southern California region's electricity reliability has been of concern for the past several years due to the planned retirement of aging facilities that depend upon once-through cooling technologies, as well as the June 2013 retirement of the San Onofre Nuclear Generating Station (San Onofre). While the once-through cooling phase-out has been ongoing since the May 2010 adoption of the State Water Resources Control Board's once-through cooling policy, the retirement of San Onofre complicated the situation. California ISO studies revealed the extent to which the South California Air Basin (SCAB) and the San Diego Air Basin (SDAB) region were vulnerable to low-voltage and post-transient voltage instability concerns. A preliminary plan to address these issues was detailed in the 2013 Integrative Energy Policy Report (IEPR) after a collaborative process with other energy agencies, utilities, and air districts (12). Similarly, the subsequent 2022 IEPR provides information and policy recommendations on advancing a clean, reliable, and affordable energy system.

California's electricity industry is an organization of traditional utilities, private generating companies, and state agencies, each with a variety of roles and responsibilities to ensure that electrical power is provided to consumers. The California ISO is a nonprofit public benefit corporation and is the impartial operator of the State's wholesale power grid and is charged with maintaining grid reliability, and to direct uninterrupted electrical energy supplies to California's homes and communities. While utilities still own transmission assets, the ISO routes electrical power along these assets, maximizing the use of the transmission system and its power generation resources. The ISO matches buyers and sellers of electricity to ensure that enough power is available to meet demand. To these ends, every five minutes the ISO forecasts electrical demands, accounts for operating reserves, and assigns the lowest cost power plant unit to meet demands while ensuring adequate system transmission capacities and capabilities (13).

Part of the ISO's charge is to plan and coordinate grid enhancements to ensure that electrical power is provided to California consumers. To this end, utilities file annual transmission expansion/modification plans to accommodate the State's growing electrical needs. The ISO reviews and either approves or denies the proposed additions. In addition, and perhaps most importantly, the ISO works with other areas in the western United States electrical grid to ensure that adequate power supplies are available to the State. In this manner, continuing reliable and affordable electrical power is assured to existing and new consumers throughout the State.

Electricity is currently provided to the Project site by Bear Valley Electric Service (BVES). BVES provides electric power to more than 23 thousand persons in 2 counties, within a service area encompassing approximately 32 square miles. Based on BVES's 2021 Power Content Label Mix, BVES derives electricity from the following two primary energy resources: fossil fuels and purchases from independent power producers and utilities, including out-of-state suppliers (14).

Tables 2-2 identifies BVES's specific proportional shares of electricity sources in 2021. As indicated in Table 2-2, the 2021 BVES Power Mix has renewable energy at 0.0% of the overall energy resources. (15).

TABLE 2-2: BVES 2021 POWER CONTENT MIX

Energy Resources	2021 BVES Power Mix
Eligible Renewable	**0.0%**
Biomass & Waste	0.0%
Geothermal	0.0%
Eligible Hydroelectric	0.0%
Solar	0.0%
Wind	0.0%
Coal	**0.0%**
Large Hydroelectric	**0.0%**
Natural Gas	**1.4%**
Nuclear	**0.0%**
Other	**0.0%**
Unspecified Sources of power*	98.6%
Total	**100%**

* "Unspecified sources of power" means electricity from transactions that are not traceable to specific generation sources

2.3 NATURAL GAS

The following summary of natural gas customers and volumes, supplies, delivery of supplies, storage, service options, and operations is excerpted from information provided by the California Public Utilities Commission (CPUC).

> *"The CPUC regulates natural gas utility service for approximately 10.8 million customers that receive natural gas from Pacific Gas and Electric (PG&E), Southern California Gas (SoCalGas), San Diego Gas & Electric (SDG&E), Southwest Gas, and several smaller natural gas utilities. The CPUC also regulates independent storage operators: Lodi Gas Storage, Wild Goose Storage, Central Valley Storage and Gill Ranch Storage.*
>
> *California's natural gas utilities provide service to over 11 million gas meters. SoCalGas and PG&E provide service to about 5.9 million and 4.3 million customers, respectively, while SDG&E provides service to over 800, 000 customers. In 2018, California gas utilities forecasted that they would deliver about 4740 million cubic feet per day (MMcfd) of gas to their customers, on average, under normal weather conditions.*
>
> *The overwhelming majority of natural gas utility customers in California are residential and small commercials customers, referred to as "core" customers. Larger volume gas customers, like electric generators and industrial customers, are called "noncore" customers. Although very small in number relative to core customers, noncore customers consume about 65% of the natural gas delivered by the state's natural gas utilities, while core customers consume about 35%.*

A significant amount of gas (about 19%, or 1131 MMcfd, of the total forecasted California consumption in 2018) is also directly delivered to some California large volume consumers, without being transported over the regulated utility pipeline system. Those customers, referred to as "bypass" customers, take service directly from interstate pipelines or directly from California producers.

SDG&E and Southwest Gas' southern division are wholesale customers of SoCalGas, i.e., they receive deliveries of gas from SoCalGas and in turn deliver that gas to their own customers. (Southwest Gas also provides natural gas distribution service in the Lake Tahoe area). Similarly, West Coast Gas, a small gas utility, is a wholesale customer of PG&E. Some other wholesale customers are municipalities like the cities of Palo Alto, Long Beach, and Vernon, which are not regulated by the CPUC.

Natural gas from out-of-state production basins is delivered into California via the interstate natural gas pipeline system. The major interstate pipelines that deliver out-of-state natural gas to California gas utilities are Gas Transmission Northwest Pipeline, Kern River Pipeline, Transwestern Pipeline, El Paso Pipeline, Ruby Pipeline, Mojave Pipeline, and Tuscarora. Another pipeline, the North Baja - Baja Norte Pipeline takes gas off the El Paso Pipeline at the California/Arizona border and delivers that gas through California into Mexico. While the Federal Energy Regulatory Commission (FERC) regulates the transportation of natural gas on the interstate pipelines, and authorizes rates for that service, the California Public Utilities Commission may participate in FERC regulatory proceedings to represent the interests of California natural gas consumers.

The gas transported to California gas utilities via the interstate pipelines, as well as some of the California-produced gas, is delivered into the PG&E and SoCalGas intrastate natural gas transmission pipelines systems (commonly referred to as California's "backbone" pipeline system). Natural gas on the utilities' backbone pipeline systems is then delivered to the local transmission and distribution pipeline systems, or to natural gas storage fields. Some large volume noncore customers take natural gas delivery directly off the high-pressure backbone and local transmission pipeline systems, while core customers and other noncore customers take delivery off the utilities' distribution pipeline systems. The state's natural gas utilities operate over 100,000 miles of transmission and distribution pipelines, and thousands more miles of service lines.

Bypass customers take most of their deliveries directly off the Kern/Mojave pipeline system, but they also take a significant amount of gas from California production.

PG&E and SoCalGas own and operate several natural gas storage fields that are located within their service territories in northern and southern California, respectively. These storage fields, and four independently owned storage utilities - Lodi Gas Storage, Wild Goose Storage, Central Valley Storage, and Gill Ranch Storage - help meet peak seasonal and daily natural gas demand and allow California natural gas customers to secure natural gas supplies more efficiently. PG&E is a 25% owner of the Gill Ranch Storage field. These storage fields provide a significant amount of infrastructure capacity to help meet

California's natural gas requirements, and without these storage fields, California would need much more pipeline capacity in order to meet peak gas requirements.

Prior to the late 1980s, California regulated utilities provided virtually all natural gas services to all their customers. Since then, the Commission has gradually restructured the California gas industry in order to give customers more options while assuring regulatory protections for those customers that wish to, or are required to, continue receiving utility-provided services.

The option to purchase natural gas from independent suppliers is one of the results of this restructuring process. Although the regulated utilities procure natural gas supplies for most core customers, core customers have the option to purchase natural gas from independent natural gas marketers, called "core transport agents" (CTA). Contact information for core transport agents can be found on the utilities' web sites. Noncore customers, on the other hand, make natural gas supply arrangements directly with producers or with marketers.

Another option resulting from the restructuring process occurred in 1993, when the Commission removed the utilities' storage service responsibility for noncore customers, along with the cost of this service from noncore customers' transportation rates. The Commission also encouraged the development of independent storage fields, and in subsequent years, all the independent storage fields in California were established. Noncore customers and marketers may now take storage service from the utility or from an independent storage provider (if available), and pay for that service, or may opt to take no storage service at all. For core customers, the Commission assures that the utility has adequate storage capacity set aside to meet core requirements, and core customers pay for that service.

In a 1997 decision, the Commission adopted PG&E's "Gas Accord", which unbundled PG&E's backbone transmission costs from noncore transportation rates. This decision gave customers and marketers the opportunity to obtain pipeline capacity rights on PG&E's backbone transmission pipeline system, if desired, and pay for that service at rates authorized by the Commission. The Gas Accord also required PG&E to set aside a certain amount of backbone transmission capacity in order to deliver gas to its core customers. Subsequent Commission decisions modified and extended the initial terms of the Gas Accord. The "Gas Accord" framework is still in place today for PG&E's backbone and storage rates and services and is now simply referred to as PG&E Gas Transmission and Storage (GT&S).

In a 2006 decision, the Commission adopted a similar gas transmission framework for Southern California, called the "firm access rights" system. SoCalGas and SDG&E implemented the firm access rights (FAR) system in 2008, and it is now referred to as the backbone transmission system (BTS) framework. As under the PG&E backbone transmission system, SoCalGas backbone transmission costs are unbundled from noncore transportation rates. Noncore customers and marketers may obtain, and pay for, firm backbone transmission capacity at various receipt points on the SoCalGas system. A

certain amount of backbone transmission capacity is obtained for core customers to assure meeting their requirements.

Many if not most noncore customers now use a marketer to provide for several of the services formerly provided by the utility. That is, a noncore customer may simply arrange for a marketer to procure its supplies, and obtain any needed storage and backbone transmission capacity, in order to assure that it will receive its needed deliveries of natural gas supplies. Core customers still mainly rely on the utilities for procurement service, but they have the option to take procurement service from a CTA. Backbone transmission and storage capacity is either set aside or obtained for core customers in amounts to assure very high levels of service.

In order properly operate their natural gas transmission pipeline and storage systems, PG&E and SoCalGas must balance the amount of gas received into the pipeline system and delivered to customers or to storage fields. Some of these utilities' storage capacity is dedicated to this service, and under most circumstances, customers do not need to precisely match their deliveries with their consumption. However, when too much or too little gas is expected to be delivered into the utilities' systems, relative to the amount being consumed, the utilities require customers to more precisely match up their deliveries with their consumption. And, if customers do not meet certain delivery requirements, they could face financial penalties. The utilities do not profit from these financial penalties - the amounts are then returned to customers as a whole. If the utilities find that they are unable to deliver all the gas that is expected to be consumed, they may even call for a curtailment of some gas deliveries. These curtailments are typically required for just the largest, noncore customers. It has been many years since there has been a significant curtailment of core customers in California." (16)

As indicated in the preceding discussions, natural gas is available from a variety of in-state and out-of-state sources and is provided throughout the state in response to market supply and demand. Complementing available natural gas resources, biogas may soon be available via existing delivery systems, thereby increasing the availability and reliability of resources in total. The CPUC oversees utility purchases and transmission of natural gas to ensure reliable and affordable natural gas deliveries to existing and new consumers throughout the State.

2.4 TRANSPORTATION ENERGY RESOURCES

The Project would generate additional vehicle trips with resulting consumption of energy resources, predominantly gasoline and diesel fuel. The Department of Motor Vehicles (DMV) identified 36.2 million registered vehicles in California (6), and those vehicles consume an estimated 17.2 billion gallons of fuel each year[1]. Gasoline (and other vehicle fuels) are commercially provided commodities and would be available to the Project patrons and employees via commercial outlets.

[1] Fuel consumptions estimated utilizing information from EMFAC2021.

California's on-road transportation system includes 396,616 lane miles, more than 26.6 million passenger vehicles and light trucks, and almost 9.0 million medium- and heavy-duty vehicles (6). While gasoline consumption has been declining since 2008 it is still by far the dominant fuel. California is the second-largest consumer of petroleum products, after Texas, and accounts for 8% of the nation's total consumption. The State is the largest U.S. consumer of motor gasoline and jet fuel, and 83% of the petroleum consumed in California is used in the transportation sector (17).

California accounts for less than 1% of total U.S. natural gas reserves and production. As with crude oil, California's natural gas production has experienced a gradual decline since 1985. In 2021, about 33% of the natural gas delivered to consumers went to the State's industrial sector, and about 31% was delivered to the electric power sector. Natural gas fueled more than two-fifths of the State's utility-scale electricity generation in 2021. The residential sector, where three-fifths of California households use natural gas for home heating, accounted for 22% of natural gas deliveries. The commercial sector received 12% of the deliveries to end users and the transportation sector consumed the remaining 1% (17).

This page intentionally left blank

3 REGULATORY BACKGROUND

Federal and state agencies regulate energy use and consumption through various means and programs. On the federal level, the United States Department of Transportation, the United States Department of Energy, and the United States Environmental Protection Agency (EPA) are three federal agencies with substantial influence over energy policies and programs. On the state level, the CPUC and the CEC are two agencies with authority over different aspects of energy. Relevant federal and state energy-related laws and plans are summarized below.

3.1 FEDERAL REGULATIONS

3.1.1 INTERMODAL SURFACE TRANSPORTATION EFFICIENCY ACT OF 1991 (ISTEA)

The ISTEA promoted the development of inter-modal transportation systems to maximize mobility as well as address national and local interests in air quality and energy. ISTEA contained factors that Metropolitan Planning Organizations (MPOs) were to address in developing transportation plans and programs, including some energy-related factors. To meet the new ISTEA requirements, MPOs adopted explicit policies defining the social, economic, energy, and environmental values guiding transportation decisions.

3.1.2 THE TRANSPORTATION EQUITY ACT FOR THE 21ST CENTURY (TEA-21)

The TEA-21 was signed into law in 1998 and builds upon the initiatives established in the ISTEA legislation, discussed above. TEA-21 authorizes highway, highway safety, transit, and other efficient surface transportation programs. TEA-21 continues the program structure established for highways and transit under ISTEA, such as flexibility in the use of funds, emphasis on measures to improve the environment, and focus on a strong planning process as the foundation of good transportation decisions. TEA-21 also provides for investment in research and its application to maximize the performance of the transportation system through, for example, deployment of Intelligent Transportation Systems, to help improve operations and management of transportation systems and vehicle safety.

3.2 CALIFORNIA REGULATIONS

3.2.1 INTEGRATED ENERGY POLICY REPORT (IEPR)

Senate Bill 1389 (Bowen, Chapter 568, Statutes of 2002) requires the CEC to prepare a biennial integrated energy policy report that assesses major energy trends and issues facing the state's electricity, natural gas, and transportation fuel sectors and provides policy recommendations to conserve resources; protect the environment; ensure reliable, secure, and diverse energy supplies; enhance the state's economy; and protect public health and safety (Public Resources Code § 25301[a]). The CEC prepares these assessments and associated policy recommendations every two years, with updates in alternate years, as part of the Integrated Energy Policy Report.

The 2022 IEPR was adopted February 2023, and continues to work towards improving electricity, natural gas, and transportation fuel energy use in California. The 2022 IEPR introduces a new

framework for embedding equity and environmental justice at the CEC and the California Energy Planning Library which allows for easier access to energy data and analytics for a wide range of users. Additionally, energy reliability, western electricity integration, gasoline cost factors and price spikes, the role of hydrogen in California's clean energy future, fossil gas transition and distributed energy resources are topics discussed within the 2022 IEPR (18).

3.2.2 STATE OF CALIFORNIA ENERGY PLAN

The CEC is responsible for preparing the State Energy Plan, which identifies emerging trends related to energy supply, demand, conservation, public health and safety, and the maintenance of a healthy economy. The Plan calls for the state to assist in the transformation of the transportation system to improve air quality, reduce congestion, and increase the efficient use of fuel supplies with the least environmental and energy costs. To further this policy, the plan identifies several strategies, including assistance to public agencies and fleet operators and encouragement of urban designs that reduce vehicle miles traveled (VMT) and accommodate pedestrian and bicycle access.

3.2.3 CALIFORNIA CODE TITLE 24, PART 6, ENERGY EFFICIENCY STANDARDS

California Code of Regulations (CCR) Title 24 Part 6: California's Energy Efficiency Standards for Residential and Nonresidential Buildings, was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. Energy efficient buildings require less electricity; therefore, increased energy efficiency reduces fossil fuel consumption and decreases greenhouse gas (GHG) emissions. The 2022 version of Title 24 was adopted by the CEC and became effective on January 1, 2023. The 2022 Title 24 standards require solar photovoltaic systems for new homes, establish requirements for newly constructed healthcare facilities, encourage demand responsive technologies for residential buildings, and update indoor and outdoor lighting standards for nonresidential buildings.

The CEC anticipates that the 2022 energy code will provide $1.5 billion in consumer benefits and reduce GHG emissions by 10 million metric tons (19). The Project would be required to comply with the applicable standards in place at the time building permit document submittals are made. These require, among other items (20):

NONRESIDENTIAL MANDATORY MEASURES

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, provide secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (5.106.4.1.2).

- Designated parking for clean air vehicles. In new projects or additions to alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).
- EV charging stations. New construction shall facilitate the future installation of EV supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of spaces to be provided for is contained in Table 5.106. 5.3.3 (5.106.5.3). Additionally, Table 5.106.5.4.1 specifies requirements for the installation of raceway conduit and panel power requirements for medium- and heavy-duty EV supply equipment for warehouses, grocery stores, and retail stores.
- Outdoor light pollution reduction. Outdoor lighting systems shall be designed to meet the backlight, uplight and glare ratings per Table 5.106.8 (5.106.8).
- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1).
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reuse or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
    - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1)
    - Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor- mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
    - Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
    - Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).

- Outdoor potable water uses in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).
- Water meters. Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 sf or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (GPD) (5.303.1.1 and 5.303.1.2).
- Outdoor water uses in rehabilitated landscape projects equal or greater than 2,500 sf. Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 sf requiring a building or landscape permit (5.304.3).
- Commissioning. For new buildings 10,000 sf and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

3.2.4 AB 1493 Pavley Regulations and Fuel Efficiency Standards

California AB 1493, enacted on July 22, 2002, required CARB to develop and adopt regulations that reduce GHGs emitted by passenger vehicles and light duty trucks. Under this legislation, CARB adopted regulations to reduce GHG emissions from non-commercial passenger vehicles (cars and light-duty trucks). Although aimed at reducing GHG emissions, specifically, a co-benefit of the Pavley standards is an improvement in fuel efficiency and consequently a reduction in fuel consumption.

3.2.5 California's Renewable Portfolio Standard (RPS)

First established in 2002 under Senate Bill (SB) 1078, California's Renewable Portfolio Standards (RPS) requires retail sellers of electric services to increase procurement from eligible renewable resources to 33% of total retail sales by 2020 (21).

3.2.6 Clean Energy and Pollution Reduction Act of 2015 (SB 350)

In October 2015, the legislature approved, and the Governor signed SB 350, which reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the renewables portfolio standard (RPS), higher energy efficiency requirements for buildings, initial strategies towards a regional electricity grid, and improved infrastructure for electric vehicle charging stations. Specifically, SB 350 requires the following to reduce statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33% to 50% by 2030, with interim targets of 40% by 2024, and 25% by 2027.
- Double the energy efficiency in existing buildings by 2030. This target will be achieved through the California Public Utility Commission (CPUC), the California Energy Commission (CEC), and local publicly owned utilities.

- Reorganize the Independent System Operator (ISO) to develop more regional electrify transmission markets and to improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States (California Leginfo 2015).

3.2.7 100 PERCENT CLEAN ENERGY ACT OF 2018 (SB 100)

In September 2018, the legislature approved, and the Governor signed SB 100, which builds on the targets established in SB 1078 and SB 350. Most notably, SB 100 sets a goal of powering all retail electricity sold in California with renewable and zero-carbon resources. Additionally, SB 100 updates the interim renewables target from 50% to 60% by 2030.

3.2.8 EXECUTIVE ORDER N-79-20 AND ADVANCED CLEAN CARS II

On August 25, 2022 CARB approved the Advanced Clean Cars II rule, which codifies the goals set out in Executive Order N-79-20 and establishes a year-by-year roadmap such that by 2035, 100% of new cars and light trucks sold in California will be zero-emission vehicles. Under this regulation, automakers are required to accelerate deliveries of zero-emission light-duty vehicles, beginning with model year 2026. CARB estimates that between 2026 and 2040, the regulation would reduce GHG emissions by a cumulative 395 million metric tons, equivalent to reducing petroleum use by 915 million barrels.

This page intentionally left blank

4 PROJECT ENERGY DEMANDS AND ENERGY EFFICIENCY MEASURES

4.1 EVALUATION CRITERIA

Per Appendix F of the *State CEQA Guidelines* (22), states that the means of achieving the goal of energy conservation includes the following:

- Decreasing overall per capita energy consumption;
- Decreasing reliance on fossil fuels such as coal, natural gas, and oil; and
- Increasing reliance on renewable energy sources.

In compliance with Appendix G of the *State CEQA Guidelines* (23), this report analyzes the project's anticipated energy use during construction and operations to determine if the Project would:

- Result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation; or
- Conflict with or obstruct a state or local plan for renewable energy or energy efficiency.

4.2 METHODOLOGY

Information from the CalEEMod Version 2022.1.1.12 outputs for the *Replenish Big Bear Program Air Quality Impact Analysis* (24) was utilized in this analysis, detailing Project related construction equipment, transportation energy demands, and facility energy demands.

CONSTRUCTION DURATION

Construction is anticipated to begin in January 2025 and will last through January 2027 (24). The construction schedule utilized in the analysis, shown in Table 4-1, represents a "worst-case" analysis scenario. The duration of construction activity and associated equipment represents a reasonable approximation of the expected construction fleet as required per *CEQA Guidelines* (25).

TABLE 4-1: CONSTRUCTION DURATION

Construction Activity	Start Date	End Date	Days
Replenish Big Bear Component 1: BBARWA WWTP Upgrades	Jan 2025	Jan 2027	515
Replenish Big Bear Component 2: Lake Discharge Pipeline Alignment	May 2025	Oct 2026	370
Replenish Big Bear Component 3: Shay Pond Conveyance Pipeline	May 2025	Oct 2026	370
Replenish Big Bear Component 4: Evaporation Pond	May 2025	Oct 2026	370
Replenish Big Bear Component 5: Sand Canyon	May 2025	Oct 2026	370

CONSTRUCTION EQUIPMENT

Table 4-2 summarizes the equipment fleets and durations modeled for each construction activity.

TABLE 4-2: CONSTRUCTION EQUIPMENT ASSUMPTIONS

Equipment	CalEEMod Equivalent	Amount	Hours Per Day
Replenish Big Bear Component 1: BBARWA WWTP Upgrades			
Dozers	Rubber Tired Dozers	1	8
Graders	Graders	1	8

Source: Construction equipment based on information provided by BBARWA and the Project Team. It should be noted that the Haul/Dump/Delivery trucks are modeled into the Trips & VMT section of CalEEMod.

4.2.1 CALEEMOD

In May 2023 the California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including the South Coast Air Quality Management District (SCAQMD), released the latest version of CalEEMod version 2022.1.1.12. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation measures (26). Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality emissions. Output from the model runs for both construction and operational activity are provided in Appendix 4.1.

4.2.2 EMISSION FACTORS MODEL

On May 2, 2022, the EPA approved the 2021 version of the EMissions FACtor model (EMFAC) web database for use in State Implementation Plan and transportation conformity analyses. EMFAC2021 is a mathematical model that was developed to calculate emission rates, fuel consumption, VMT from motor vehicles that operate on highways, freeways, and local roads in

California and is commonly used by the CARB to project changes in future emissions from on-road mobile sources (27). This energy study utilizes the different fuel types for each vehicle class from the annual EMFAC2021 emission inventory in order to derive the average vehicle fuel economy which is then used to determine the estimated annual fuel consumption associated with vehicle usage during Project construction and operational activities. For purposes of the analysis, the 2025, 2026, 2027 analysis years were utilized to determine the average vehicle fuel economy used throughout the duration of the Project. Output from the EMFAC2021 model runs are provided in Appendix 4.2.

4.3 CONSTRUCTION ENERGY DEMANDS

The focus within this section is the energy implications of the construction process, specifically the power cost from on-site electricity consumption during construction of the proposed Project.

4.3.1 CONSTRUCTION POWER COST

The total Project construction power costs is the summation of the products of the area (sf) by the construction duration and the typical power cost.

PROJECT CONSTRUCTION POWER COST

The *2023 National Construction Estimator* identifies a typical power cost per 1,000 sf of construction per month of $2.50, which was used to calculate the Project's total construction power cost (28).

As shown on Table 4-3, the total power cost of the on-site electricity usage during the construction of the Project is estimated to be approximately $126,967.83.

TABLE 4-3: CONSTRUCTION POWER COST

Land Use	Power Cost (per 1,000 SF of construction per month)	Size (1,000 SF)	Construction Duration (months)	Project Construction Power Cost
BBARWA WWTP Upgrades	$2.50	173.805	24	$10,428.28
Lake Discharge Pipeline Alignment	$2.50	3,092.766	17	$3,813.68
Shay Pond Conveyance Pipeline	$2.50	28.314	17	$1,203.35
Evaporation Pond	$2.50	141.135	17	$105,524.29
Sand Canyon	$2.50	2,482.924	17	$5,998.22
TOTAL CONSTRUCTION POWER COST				***$126,967.83***

4.3.2 CONSTRUCTION ELECTRICITY USAGE

The total Project construction electricity usage is the summation of the products of the power cost (estimated in Table 4-3) by the utility provider cost per kilowatt hour (kWh) of electricity.

PROJECT CONSTRUCTION ELECTRICITY USAGE

The BVES's general service rate schedule were used to determine the Project's electrical usage. As of March 1, 2023, BVES's general service rate is $0.25 per kilowatt hours (kWh) of electricity for general services (29). As shown on Table 4-4, the total electricity usage from on-site Project construction related activities is estimated to be approximately 505,164 kWh.

TABLE 4-4: CONSTRUCTION ELECTRICITY USAGE

Land Use	Cost per kWh	Project Construction Electricity Usage (kWh)
Proposed Project		
BBARWA WWTP Upgrades	$0.25	41,491
Lake Discharge Pipeline Alignment	$0.25	15,173
Shay Pond Conveyance Pipeline	$0.25	4,788
Evaporation Pond	$0.25	419,847
Sand Canyon	$0.25	23,865
TOTAL CONSTRUCTION ELECTRICITY USAGE		***505,164***

4.3.3 CONSTRUCTION EQUIPMENT FUEL ESTIMATES

Fuel consumed by construction equipment would be the primary energy resource expended over the course of Project construction.

PROJECT CONSTRUCTION EQUIPMENT FUEL CONSUMPTION

Project construction activity timeline estimates, construction equipment schedules, equipment power ratings, load factors, and associated fuel consumption estimates are presented in Table 4-5.

The aggregate fuel consumption rate for all equipment is estimated at 18.5 horsepower hour per gallon (hp-hr-gal.), obtained from CARB 2018 Emissions Factors Tables and cited fuel consumption rate factors presented in Table D-24 of the Moyer guidelines (30). For the purposes of this analysis, the calculations are based on all construction equipment being diesel-powered which is consistent with industry standards. Diesel fuel would be supplied by existing commercial fuel providers serving the Project area and region[2]. As presented on Table 4-5, Project construction activities would consume an estimated 565,550 gallons of diesel fuel. Project construction would represent a "single-event" diesel fuel demand and would not require on-going or permanent commitment of diesel fuel resources for this purpose.

[2] Based on Appendix A of the CalEEMod User's Guide, Construction consists of several types of off-road equipment. Since the majority of the off-road construction equipment used for construction projects are diesel fueled, CalEEMod assumes all of the equipment operates on diesel fuel.

TABLE 4-5: CONSTRUCTION EQUIPMENT FUEL CONSUMPTION ESTIMATES

Construction Activity	Duration (Days)	Equipment	HP Rating	Quantity	Usage Hours	Load Factor	HP-hrs/day	Total Fuel Consumption (gal. diesel fuel)

4.3.4 CONSTRUCTION TRIPS AND VMT

Construction generates on-road vehicle emissions from vehicle usage for workers, hauling, and vendors commuting to and from the site. The number of workers, hauling, and vendor trips are presented below in Table 4-6. It should be noted that the trip length for workers, hauling, and vendor trips were adjusted to 100 miles based on BBARWA and the Project Team provided data.

TABLE 4-6: CONSTRUCTION TRIPS AND VMT

Construction Activity	One-Way Trips per Day			Trip Length

4.3.5 CONSTRUCTION WORKER FUEL ESTIMATES

With respect to estimated VMT for the Project, the construction worker trips would generate an estimated 4,532,000 VMT during construction (24). Based on CalEEMod methodology, it is assumed that 50% of all worker trips are from light-duty-auto vehicles (LDA), 25% are from light-duty-trucks (LDT1[3]), and 25% are from light-duty-trucks (LDT2[4]). Data regarding Project related construction worker trips were based on CalEEMod defaults utilized within the AQIA.

[3] Vehicles under the LDT1 category have a gross vehicle weight rating (GVWR) of less than 6,000 lbs. and equivalent test weight (ETW) of less than or equal to 3,750 lbs.

[4] Vehicles under the LDT2 category have a GVWR of less than 6,000 lbs. and ETW between 3,751 lbs. and 5,750 lbs.

Vehicle fuel efficiencies for LDA, LDT1, and LDT2 were estimated using information generated within the 2021 version of the EMFAC developed by CARB. EMFAC2021 is a mathematical model that was developed to calculate emission rates, fuel consumption, and VMT from motor vehicles that operate on highways, freeways, and local roads in California and is commonly used by the CARB to project changes in future emissions from on-road mobile sources (27). EMFAC2021 was run for the LDA, LDT1, and LDT2 vehicle class within the San Bernardino South Coast sub-area for the 2025, 2026, 2027 calendar years. Data from EMFAC2021 is shown in Appendix 4.2.

Tables 4-7 through 4-9 provide estimated annual fuel consumption resulting from Project construction worker trips. Based on Tables 4-7 through 4-9, it is estimated that 157,463 gallons of fuel will be consumed related to construction worker trips during full construction of the Project.

It should be noted that construction worker trips would represent a "single-event" gasoline fuel demand and would not require on-going or permanent commitment of fuel resources for this purpose.

4.3.6 CONSTRUCTION VENDOR/HAULING FUEL ESTIMATES

With respect to estimated VMT, the construction vendor and hauling trips (vehicles that deliver/export materials to and from the site during construction) would generate an estimated 3,706,415 VMT along area roadways for the Project over the duration of construction activity (24). It is assumed that 50% of all vendor trips are from medium-heavy duty trucks (MHDT), 50% of vendor trips are from heavy-heavy duty trucks (HHDT), and 100% of all hauling trips are from HHDTs. These assumptions are consistent with the CalEEMod defaults utilized within the within the AQIA (24). Vehicle fuel efficiencies for MHDTs and HHDTs were estimated using information generated within EMFAC2021. EMFAC2021 was run for the MHDT and HHDT vehicle classes within the San Bernardino South Coast sub-area for the 2025, 2026, 2027 calendar years. Data from EMFAC2021 is shown in Appendix 4.2.

Based on Tables 4-10 through 4-12, it is estimated that 583,562 gallons of fuel will be consumed related to construction vendor and hauling trips during full construction of the Project.

It should be noted that construction vendor and hauling trips would represent a “single-event” gasoline fuel demand and would not require on-going or permanent commitment of fuel resources for this purpose.

4.3.7 CONSTRUCTION ENERGY EFFICIENCY/CONSERVATION MEASURES

The equipment used for Project construction would conform to CARB regulations and California emissions standards. There are no unusual Project characteristics or construction processes that would require the use of equipment that would be more energy intensive than is used for comparable activities; or equipment that would not conform to current emissions standards (and related fuel efficiencies). Equipment employed in construction of the Project would therefore not result in inefficient wasteful, or unnecessary consumption of fuel.

The Project would utilize construction contractors which practice compliance with applicable CARB regulation regarding retrofitting, repowering, or replacement of diesel off-road construction equipment. Additionally, CARB has adopted the Airborne Toxic Control Measure to limit heavy-duty diesel motor vehicle idling in order to reduce public exposure to diesel particulate matter and other Toxic Air Contaminants. Compliance with anti-idling and emissions regulations would result in a more efficient use of construction-related energy and the minimization or elimination of wasteful or unnecessary consumption of energy. Idling restrictions and the use of newer engines and equipment would result in less fuel combustion and energy consumption.

Additionally, certain incidental construction-source energy efficiencies would likely accrue through implementation of California regulations and best available control measures (BACM). More specifically, California Code of Regulations Title 13, Motor Vehicles, section 2449(d)(3) Idling, limits idling times of construction vehicles to no more than five minutes, thereby precluding unnecessary and wasteful consumption of fuel due to unproductive idling of construction equipment. To this end, “grading plans shall reference the requirement that a sign shall be posted on-site stating that construction workers need to shut off engines at or before five minutes of idling.” In this manner, construction equipment operators are informed that engines are to be turned off at or prior to five minutes of idling. Enforcement of idling limitations is realized through periodic site inspections conducted by County building officials, and/or in response to citizen complaints.

Indirectly, construction energy efficiencies and energy conservation would be achieved for the proposed development through energy efficiencies realized from bulk purchase, transport and use of construction materials.

A full analysis related to the energy needed to form construction materials is not included in this analysis due to a lack of detailed Project-specific information on construction materials. At this time, an analysis of the energy needed to create Project-related construction materials would be extremely speculative and thus has not been prepared.

In general, the construction processes promote conservation and efficient use of energy by reducing raw materials demands, with related reduction in energy demands associated with raw materials extraction, transportation, processing and refinement. Use of materials in bulk reduces energy demands associated with preparation and transport of construction materials as well as the transport and disposal of construction waste and solid waste in general, with corollary

reduced demands on area landfill capacities and energy consumed by waste transport and landfill operations.

4.4 OPERATIONAL ENERGY DEMANDS

Energy consumption in support of or related to Project operations would include minimal transportation fuel demands (fuel consumed by maintenance vehicles accessing the Project site), fuel demands from operational equipment, and facilities energy demands (energy consumed by building operations and site maintenance activities).

4.4.1 TRANSPORTATION FUEL DEMANDS

In terms of operational energy demands, the proposed Project involves the construction of monitoring wells, conveyance facilities and ancillary facilities, evaporation ponds, advanced water purification facilities, and associated improvements. The proposed Project does not include any substantive new stationary or mobile sources of emissions, and therefore, by its very nature, will not generate substantive amounts of energy demand from Project operations. The Project does not propose a trip-generating land use and while it is anticipated that the Project would require intermittent maintenance, such maintenance would be minimal requiring a negligible amount of traffic trips on an annual basis.

4.4.2 OPERATIONAL ENERGY DEMANDS

Project building operations activities would result in the consumption of natural gas and electricity, which would be supplied to the Project by Southwest Gas Corp. and BVES. As summarized on Table 4-14 the Project would result in 760,427 kBTU/year of natural gas and a net electricity demand of 147,883 kWh/year of electricity after netting out the 3,652,117 kWh/year of electricity generated by the project's photovoltaic solar design feature.

Land Use	Natural Gas Demand (kBTU/year)	Electricity Demand (kWh/year)
Warehouse	760,427	3,800,000
Parking Lot	0	19,079
TOTAL PROJECT ENERGY DEMAND	**760,427**	**3,819,079**
Solar Generation (kWh/year)	***N/A***	***3,652,117***
NET ENERGY DEMANDS	**760,427**	**147,883**

4.5 SUMMARY

4.5.1 CONSTRUCTION ENERGY DEMANDS

The estimated power cost of on-site electricity usage during the construction of the Project is assumed to be approximately $126,967.83. Additionally, based on the assumed power cost, it is estimated that the total electricity usage during construction, after full Project build-out, is calculated to be approximately 505,164 kWh.

Construction equipment used by the Project would result in single event consumption of approximately 565,550 gallons of diesel fuel. Construction equipment use of fuel would not be atypical for the type of construction proposed because there are no aspects of the Project's proposed construction process that are unusual or energy-intensive, and Project construction equipment would conform to the applicable CARB emissions standards, acting to promote equipment fuel efficiencies.

CCR Title 13, Title 13, Motor Vehicles, section 2449(d)(3) Idling, limits idling times of construction vehicles to no more than 5 minutes, thereby precluding unnecessary and wasteful consumption of fuel due to unproductive idling of construction equipment. BACMs inform construction equipment operators of this requirement. Enforcement of idling limitations is realized through periodic site inspections conducted by City building officials, and/or in response to citizen complaints.

Construction worker trips for full construction of the Project would result in the estimated fuel consumption of 157,463 gallons of fuel. Additionally, fuel consumption from construction hauling and vendor trips (MHDTs and HHDTs) will total approximately 583,562 gallons. Diesel fuel would be supplied by City and regional commercial vendors. Indirectly, construction energy efficiencies and energy conservation would be achieved using bulk purchases, transport and use of construction materials. The 2022 IEPR released by the CEC has shown that fuel efficiencies are getting better within on and off-road vehicle engines due to more stringent government requirements (31). As supported by the preceding discussions, Project construction energy consumption would not be considered inefficient, wasteful, or otherwise unnecessary.

4.5.2 Operational Energy Demands

Facility Energy Demands

Project facility operational energy demands are estimated at: 760,427 kBTU/year of natural gas and 147,883 kWh/year of electricity. Natural gas would be supplied to the Project by Southwest Gas Corp.; electricity would be supplied by BVES. The Project does not propose uses that are inherently energy intensive and the energy demands in total would be comparable to other land uses of similar scale and configuration.

Lastly, the Project will comply with the applicable Title 24 standards. Compliance itself with applicable Title 24 standards will ensure that the Project energy demands would not be inefficient, wasteful, or otherwise unnecessary.

This page intentionally left blank

5 CONCLUSIONS

5.1 ENERGY IMPACT 1

Would the Project result in potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during project construction or operation?

Impact Analysis

A significant impact would occur if the proposed Project would result in the inefficient, wasteful, or unnecessary use of energy.

Construction

Based on CalEEMod estimations within the modeling output files used to estimate GHG emissions, construction-related vehicle trips would result in approximately 8.2 million VMT and consume an estimated 741,025 gallons of gasoline and diesel combined during future development projects construction phases. Additionally, on-site construction equipment would consume an estimated 565,550 gallons of diesel fuel. Limitations on idling of vehicles and equipment and requirements that equipment be properly maintained would result in fuel savings. California Code of Regulations, Title 13, Sections 2449 and 2485, limit idling from both on-road and off-road diesel- powered equipment and are enforced by the ARB. Additionally, given the cost of fuel, contractors and owners have a strong financial incentive to avoid wasteful, inefficient, and unnecessary consumption of energy during construction.

Due to the temporary nature of construction and the financial incentives for developers and contractors to use energy-consuming resources in an efficient manner, the construction phase of the proposed project would not result in wasteful, inefficient, and unnecessary consumption of energy. Therefore, the construction-related impacts related to electricity and fuel consumption would be less than significant.

Operation

Electricity and Natural Gas

Operation of the proposed project would consume energy as part of building operations and transportation activities. Building operations would involve energy consumption for multiple purposes and based on CalEEMod energy use estimations, operations for the Project would result in approximately 147,883 kWh of electricity and 760,427 kBTU/year of natural gas annually.

The Project would be designed and constructed in accordance with the City's latest adopted energy efficiency standards, which are based on the California Title 24 energy efficiency standards. Title 24 standards include a broad set of energy conservation requirements that apply to the structural, mechanical, electrical, and plumbing systems in a building. For example, the Title 24 Lighting Power Density requirements define the maximum wattage of lighting that can be used in a building based on its square footage. Title 24 standards are widely regarded as the

most advanced energy efficiency standards, would help reduce the amount of energy required for lighting, water heating, and heating and air conditioning in buildings and promote energy conservation.

Fuel

As mentioned previously, the proposed Project does not include any substantive new stationary or mobile sources of emissions, and therefore, by its very nature, will not generate substantive amounts of energy demand from Project operations. The Project does not propose trip-generating land use and while it is anticipated that the Project would require intermittent maintenance, such maintenance would be minimal requiring a negligible amount of traffic trips on an annual basis. For these reasons, operational-related transportation fuel consumption would not result in a significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources. Therefore, the operational impact related to vehicle fuel consumption would be less than significant.

5.2 ENERGY IMPACT 2

Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

Impact Analysis

A significant impact would occur if the proposed Project would conflict with or obstruct a State or local plan for renewable energy or energy efficiency.

Construction

As discussed in Section 5.1, above, the proposed project would result in energy consumption through the combustion of fossil fuels in construction vehicles, worker commute vehicles, and construction equipment, and the use of electricity for temporary buildings, lighting, and other sources. California Code of Regulations Title 13, Sections 2449 and 2485, limit idling from both on- road and off-road diesel-powered equipment and are enforced by the ARB. The proposed project would comply with these regulations. There are no policies at the local level applicable to energy conservation specific to the construction phase. Thus, it is anticipated that construction of the proposed project would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. Therefore, construction- related energy efficiency and renewable energy standards consistency impacts would be less than significant.

Operation

California's Renewable Portfolio Standard (RPS) establishes a goal of renewable energy for local providers to be 44 percent by 2040. Similarly, the State is promoting renewable energy targets to meet the 2022 Scoping Plan greenhouse gas emissions reductions. As discussed in Section 5.1, above, the Project would result in approximately 147,883 kWh of electricity and 760,427 kBTU/year of natural gas annually.

The Project would be designed and constructed in accordance with the City's latest adopted energy efficiency standards, which are based on the California Title 24 energy efficiency standards. Title 24 standards include a broad set of energy conservation requirements that apply to the structural, mechanical, electrical, and plumbing systems in a building. For example, the Title 24 Lighting Power Density requirements define the maximum wattage of lighting that can be used in a building based on its square footage. Title 24 standards are widely regarded as the most advanced energy efficiency standards, would help reduce the amount of energy required for lighting, water heating, and heating and air conditioning in buildings and promote energy conservation.

Compliance with the aforementioned mandatory measures would ensure that future development projects would not conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing energy use or increasing the use of renewable energy. Therefore, operational energy efficiency and renewable energy standards consistency impacts would be less than significant.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15309-WWTP Upgrades (Unmitigated)
Construction Start Date	1/1/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	1.80
Location	34.269428, -116.815824
County	San Bernardino-South Coast
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5156
EDFZ	10
Electric Utility	Bear Valley Electric Service
Gas Utility	Southwest Gas Corp.
App Version	2022.1.1.18

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

Unrefrigerated Warehouse-Rail	40.0	1000sqft	0.92	40,000	0.00	—	—	—
Other Non-Asphalt Surfaces	2.00	Acre	2.00	0.00	0.00	—	—	Pump Station
Parking Lot	0.50	Acre	0.50	0.00	0.00	—	—	—
User Defined Linear	0.26	Mile	0.14	0.00	0.00	—	—	—
Other Asphalt Surfaces	0.44	Acre	0.44	0.00	0.00	—	—	Remaining SF

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Energy	E-10-B	Establish Onsite Renewable Energy Systems: Solar Power

2. Emissions Summary

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6

Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Based on Client Provided data and construction schedule
Construction: Off-Road Equipment	Client Provided construction equipment list
Construction: Trips and VMT	Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.
Operations: Vehicle Data	No trips data available
Operations: Architectural Coatings	SCAQMD Rule 1113
Construction: Dust From Material Movement	Export expected per Project data

Construction: Architectural Coatings	SCAQMD Rule 1113
Operations: Energy Use	Electricity adjusted based on client provided data
Operations: Water and Waste Water	Taken from 2022 Lake Analysis report

APPENDIX 4.2:

CALEEMOD PROJECT COMPONENT 2 EMISSIONS MODEL OUTPUTS

15309-Lake Pipeline (Unmitigated) Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

3. Construction Emissions Details

3.1. Linear, Grading & Excavation (2025) - Unmitigated

3.3. Linear, Grading & Excavation (2026) - Unmitigated

3.5. Linear, Drainage, Utilities, & Sub-Grade (2026) - Unmitigated

3.7. Demolition (2025) - Unmitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15309-Lake Pipeline (Unmitigated)
Construction Start Date	5/1/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	1.80
Location	34.269428, -116.815824
County	San Bernardino-South Coast
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5156
EDFZ	10
Electric Utility	Bear Valley Electric Service
Gas Utility	Southwest Gas Corp.
App Version	2022.1.1.18

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

User Defined Linear	3.78	Mile	2.06	0.00	—	—	—	—
Other Non-Asphalt Surfaces	1.00	Acre	1.00	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list
Construction: Trips and VMT	13 haul trucks and 2 worker trucks accounted for in Linear, Grading & Excavation Phase in addition to default CalEEMod hauling trucks. Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Linear, Grading & Excavation	—	7,020	0.65	0.00	—
Linear, Drainage, Utilities, & Sub-Grade	—	—	0.65	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
User Defined Linear	0.65	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	29.4	565	0.03	< 0.005
2026	29.4	482	0.03	< 0.005

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

Vegetation Land Use Type	Vegetation Soil Type	Initial Acres	Final Acres

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	39.3	annual days of extreme heat
Extreme Precipitation	4.40	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	31.0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1

Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	86.34672142
Active commuting	8.161170281
Social	—
2-parent households	29.38534582
Voting	73.38637239

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided schedule
Construction: Off-Road Equipment	Client provided equipment list
Construction: Trips and VMT	Client provided total worker trips and hauling trips which equals 8,000 round trips.

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.1	annual days of extreme heat
Extreme Precipitation	8.60	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	32.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	98.7
AQ-PM	4.43
AQ-DPM	1.14

Drinking Water	70.5
Lead Risk Housing	65.1
Pesticides	4.55
Toxic Releases	18.1
Traffic	3.04
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	1.80
Impaired Water Bodies	90.1
Solid Waste	75.7
Sensitive Population	—
Asthma	26.6
Cardio-vascular	44.6
Low Birth Weights	67.2
Socioeconomic Factor Indicators	—
Education	9.73
Housing	12.8
Linguistic	0.26
Poverty	55.9
Unemployment	35.0

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	53.62504812

Employed	15.8475555
Median HI	38.16245348
Education	—
Bachelor's or higher	57.65430515
High school enrollment	0.372128834
Preschool enrollment	1.873476197
Transportation	—

2016 Voting	97.1

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	24.0
Healthy Places Index Score for Project Location (b)	21.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino National Forest Area, California
Survey Area Data: Version 14, Sep 1, 2022

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Feb 27, 2021—May 27, 2021

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Warning: Soil Map may not be valid at this scale.

Enlargement of maps beyond the scale of mapping can cause misunderstanding of the detail of mapping and accuracy of soil line placement. The maps do not show the small areas of contrasting soils that could have been shown at a more detailed scale.

Please rely on the bar scale on each map sheet for map measurements.

EXECUTIVE SUMMARY

ES.1 SUMMARY OF FINDINGS

The results of this *Replenish Big Bear Program Greenhouse Gas Analysis* (GHGA) is summarized below based on the significance criteria in Section 3 of this report consistent with Appendix G of the California Environmental Quality Act (CEQA) Guidelines (1). Table ES-1 shows the findings of significance for potential greenhouse gas (GHG) impacts under CEQA.

TABLE ES-1: SUMMARY OF CEQA SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
GHG Impact #1: The Project would not generate direct or indirect GHG emission that would result in a significant impact on the environment.	3.8	*Less Than Significant*	*n/a*
GHG Impact #2: The Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHGs.	3.8	*Less Than Significant*	*n/a*

ES.2 PROJECT REQUIREMENTS

The Project would be required to comply with regulations imposed by the State of California and the South Coast Air Quality Management District (SCAQMD) aimed at the reduction of air pollutant emissions. Those that are directly and indirectly applicable to the Project and that would assist in the reduction of GHG emissions include:

- Global Warming Solutions Act of 2006 (Assembly Bill (AB) 32) (2).
- Regional GHG Emissions Reduction Targets/Sustainable Communities Strategies (Senate Bill (SB) 375) (3).
- Pavley Fuel Efficiency Standards (AB 1493). Establishes fuel efficiency ratings for new vehicles (4).
- California Building Code (Title 24 California Code of Regulations (CCR)). Establishes energy efficiency requirements for new construction (5).
- Appliance Energy Efficiency Standards (Title 20 CCR). Establishes energy efficiency requirements for appliances (6).
- Low Carbon Fuel Standard (LCFS). Requires carbon content of fuel sold in California to be 10 percent (%) less by 2020 (7).
- California Water Conservation in Landscaping Act of 2006 (AB 1881). Requires local agencies to adopt the Department of Water Resources updated Water Efficient Landscape Ordinance or equivalent by January 1, 2010 to ensure efficient landscapes in new development and reduced water waste in existing landscapes (8).

- Statewide Retail Provider Emissions Performance Standards (SB 1368). Requires energy generators to achieve performance standards for GHG emissions (9).
- Renewable Portfolio Standards (SB 1078 – also referred to as RPS). Requires electric corporations to increase the amount of energy obtained from eligible renewable energy resources to 20 % by 2010 and 33% by 2020 (10).
- California Global Warming Solutions Act of 2006 (SB 32). Requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15 (11).

Promulgated regulations that will affect the Project's emissions are accounted for in the Project's GHG calculations provided in this report. In particular, AB 1493, LCFS, and RPS, and therefore are accounted for in the Project's emission calculations.

1 INTRODUCTION

This report presents the results of the Greenhouse Gas Analysis (GHGA) prepared by Urban Crossroads, Inc., for the proposed Replenish Big Bear Program (Project). The purpose of this GHGA is to evaluate Project-related construction and operational emissions and determine the level of GHG impacts as a result of constructing and operating the proposed Project.

1.1 SITE LOCATION

The proposed Project site is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake are located in the middle of this Basin. The overall project area consists of the Valley in the County of San Bernardino, as shown on Exhibit 1-A.

1.2 PROJECT DESCRIPTION

The proposed Project includes upgrades and additions to Big Bear Area Regional Wastewater Agency's (BBARWA) wastewater treatment plant (WWTP) to produce purified water through full advanced treatment to protect the receiving waters and their beneficial uses. The Replenish Big Bear Program would upgrade BBARWA's WWTP to produce full advanced treated water that would be retained within the Big Bear Valley watershed to be used to increase the sustainability of local water supplies, consequently, wastewater currently delivered to Lucerne Valley will be modified. The proposed Project consists of construction and operation of the various facilities which are separated into five project categories: 1) Replenish Big Bear Component 1: Lake Discharge Pipeline Alignment; 2) Replenish Big Bear Component 2: Shay Pond; 3) Replenish Big Bear Component 3: Evaporation Pond; 4) Replenish Big Bear Component 4: BBARWA WWTP Upgrades; and 5) Replenish Big Bear Component 5: Sand Canyon.

REPLENISH BIG BEAR COMPONENT 1: BBARWA WWTP UPGRADES

This Replenish Big Bear Component includes upgrades to the BBARWA WWTP, to include 2.2 MGD of full advanced treatment, producing up to 2,210 AFY of purified water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the solar evaporation ponds. Additionally, the BBARWA WWTP Treatment Upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump purified water to Shay Pond and Stanfield Marsh.

REPLENISH BIG BEAR COMPONENT 2: LAKE DISCHARGE PIPELINE ALIGNMENT

The Replenish Big Bear Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

REPLENISH BIG BEAR COMPONENT 3: SHAY POND CONVEYANCE PIPELINE

The Replenish Big Bear Program would ultimately install about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

REPLENISH BIG BEAR COMPONENT 4: EVAPORATION POND

The Replenish Big Bear Program would include between 23 and 57 acres of evaporation ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to 2 monitoring wells.

REPLENISH BIG BEAR COMPONENT 5: SAND CANYON

The Sand Canyon groundwater recharge project involves extracting Project water stored in the Lake to a temporary storage pond using existing infrastructure owned by a local resort. The Project water will then be pumped and conveyed to the Sand Canyon recharge area using a new pump station and pipeline.

As part of the Replenish Big Bear Program, the following will be constructed:

- A new 471 gpm pump station near the snowmaking pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

2 CLIMATE CHANGE SETTING

2.1 INTRODUCTION TO GLOBAL CLIMATE CHANGE (GCC)

GCC is defined as the change in average meteorological conditions on the earth with respect to temperature, precipitation, and storms. The majority of scientists believe that the climate shift taking place since the Industrial Revolution is occurring at a quicker rate and magnitude than in the past. Scientific evidence suggests that GCC is the result of increased concentrations of GHGs in the earth's atmosphere, including carbon dioxide (CO_2), methane (CH_4), nitrous oxide (N_2O), and fluorinated gases. The majority of scientists believe that this increased rate of climate change is the result of GHGs resulting from human activity and industrialization over the past 200 years.

An individual project like the proposed Project evaluated in this GHGA cannot generate enough GHG emissions to affect a discernible change in global climate. However, the proposed Project may participate in the potential for GCC by its incremental contribution of GHGs combined with the cumulative increase of all other sources of GHGs, which when taken together constitute potential influences on GCC. Because these changes may have serious environmental consequences, Section 3.0 will evaluate the potential for the proposed Project to have a significant effect upon the environment as a result of its potential contribution to the greenhouse effect.

2.2 GLOBAL CLIMATE CHANGE DEFINED

GCC refers to the change in average meteorological conditions on the earth with respect to temperature, wind patterns, precipitation and storms. Global temperatures are regulated by naturally occurring atmospheric gases such as water vapor, CO_2, N_2O, CH_4, hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF_6). These particular gases are important due to their residence time (duration they stay) in the atmosphere, which ranges from 10 years to more than 100 years. These gases allow solar radiation into the earth's atmosphere, but prevent radioactive heat from escaping, thus warming the earth's atmosphere. GCC can occur naturally as it has in the past with the previous ice ages.

Gases that trap heat in the atmosphere are often referred to as GHGs. GHGs are released into the atmosphere by both natural and anthropogenic activity. Without the natural GHG effect, the earth's average temperature would be approximately 61 degrees Fahrenheit (°F) cooler than it is currently. The cumulative accumulation of these gases in the earth's atmosphere is considered to be the cause for the observed increase in the earth's temperature.

2.3 GREENHOUSE GASES

2.3.1 GHGS AND HEALTH EFFECTS

GHGs trap heat in the atmosphere, creating a GHG effect that results in global warming and climate change. Many gases demonstrate these properties and as discussed in Table 2-1. For the purposes of this analysis, emissions of CO_2, CH_4, and N_2O were evaluated (see Table 3-1 later in this report) because these gases are the primary contributors to GCC from development projects.

Although there are other substances such as fluorinated gases that also contribute to GCC, these fluorinated gases were not evaluated as their sources are not well-defined and do not contain accepted emissions factors or methodology to accurately calculate these gases.

TABLE 2-1: GREENHOUSE GASES

Greenhouse Gases	Description	Sources	Health Effects
Water	Water is the most abundant, important, and variable GHG in the atmosphere. Water vapor is not considered a pollutant; in the atmosphere it maintains a climate necessary for life. Changes in its concentration are primarily considered to be a result of climate feedbacks related to the warming of the atmosphere rather than a direct result of industrialization. A climate feedback is an indirect, or secondary, change, either positive or negative, that occurs within the climate system in response to a forcing mechanism. The feedback loop in which water is involved is critically important to projecting future climate change. As the temperature of the atmosphere rises, more water is evaporated from ground storage (rivers, oceans, reservoirs, soil). Because the air is warmer, the relative humidity can be higher (in essence, the air is able to 'hold' more water when it is warmer), leading to more water vapor in the atmosphere. As a GHG, the higher concentration of water vapor is then able to absorb more thermal indirect energy radiated from the Earth, thus further warming the atmosphere. The warmer atmosphere can then hold more water vapor and so on and so on. This is referred to as a "positive feedback loop." The extent to which this positive feedback loop will continue is	The main source of water vapor is evaporation from the oceans (approximately 85%). Other sources include evaporation from other water bodies, sublimation (change from solid to gas) from sea ice and snow, and transpiration from plant leaves.	There are no known direct health effects related to water vapor at this time. It should be noted however that when some pollutants react with water vapor, the reaction forms a transport mechanism for some of these pollutants to enter the human body through water vapor.

Greenhouse Gases	Description	Sources	Health Effects
	unknown as there are also dynamics that hold the positive feedback loop in check. As an example, when water vapor increases in the atmosphere, more of it will eventually condense into clouds, which are more able to reflect incoming solar radiation (thus allowing less energy to reach the earth's surface and heat it up) (12).		
CO_2	CO_2 is an odorless and colorless GHG. Since the industrial revolution began in the mid-1700s, the sort of human activity that increases GHG emissions has increased dramatically in scale and distribution. Data from the past 50 years suggests a corollary increase in levels and concentrations. As an example, prior to the industrial revolution, CO_2 concentrations were fairly stable at 280 parts per million (ppm). Today, they are around 370 ppm, an increase of more than 30%. Left unchecked, the concentration of CO_2 in the atmosphere is projected to increase to a minimum of 540 ppm by 2100 as a direct result of anthropogenic sources (13).	CO_2 is emitted from natural and manmade sources. Natural sources include: the decomposition of dead organic matter; respiration of bacteria, plants, animals and fungus; evaporation from oceans; and volcanic outgassing. Anthropogenic sources include: the burning of coal, oil, natural gas, and wood. CO_2 is naturally removed from the air by photosynthesis, dissolution into ocean water, transfer to soils and ice caps, and chemical weathering of carbonate rocks (14).	Outdoor levels of CO_2 are not high enough to result in negative health effects. According to the National Institute for Occupational Safety and Health (NIOSH) high concentrations of CO_2 can result in health effects such as: headaches, dizziness, restlessness, difficulty breathing, sweating, increased heart rate, increased cardiac output, increased blood pressure, coma, asphyxia, and/or convulsions. It should be noted that current concentrations of CO_2 in the earth's atmosphere are estimated to be approximately 370 ppm, the actual reference exposure level (level at which adverse health effects typically occur) is at exposure levels of 5,000 ppm averaged over 10 hours in a 40-hour workweek and short-term reference exposure levels of 30,000 ppm averaged over a 15 minute period (15).

Greenhouse Gases	Description	Sources	Health Effects
CH_4	CH_4 is an extremely effective absorber of radiation, although its atmospheric concentration is less than CO_2 and its lifetime in the atmosphere is brief (10-12 years), compared to other GHGs.	CH_4 has both natural and anthropogenic sources. It is released as part of the biological processes in low oxygen environments, such as in swamplands or in rice production (at the roots of the plants). Over the last 50 years, human activities such as growing rice, raising cattle, using natural gas, and mining coal have added to the atmospheric concentration of CH_4. Other anthropocentric sources include fossil-fuel combustion and biomass burning (16).	CH_4 is extremely reactive with oxidizers, halogens, and other halogen-containing compounds. Exposure to high levels of CH_4 can cause asphyxiation, loss of consciousness, headache and dizziness, nausea and vomiting, weakness, loss of coordination, and an increased breathing rate.
N_2O	N_2O, also known as laughing gas, is a colorless GHG. Concentrations of N_2O also began to rise at the beginning of the industrial revolution. In 1998, the global concentration was 314 parts per billion (ppb).	N_2O is produced by microbial processes in soil and water, including those reactions which occur in fertilizer containing nitrogen. In addition to agricultural sources, some industrial processes (fossil fuel-fired power plants, nylon production, nitric acid production, and vehicle emissions) also contribute to its atmospheric load. It is used as an aerosol spray propellant, i.e., in whipped cream bottles. It is also	N_2O can cause dizziness, euphoria, and sometimes slight hallucinations. In small doses, it is considered harmless. However, in some cases, heavy and extended use can cause Olney's Lesions (brain damage) (17).

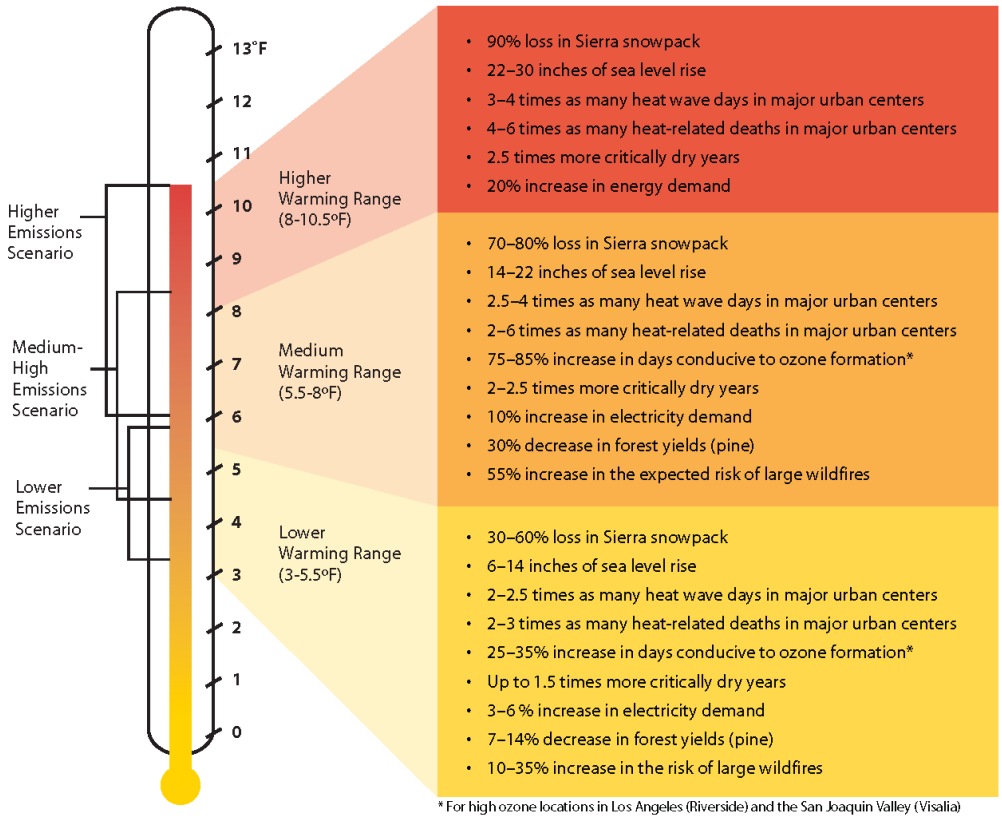
Greenhouse Gases	Description	Sources	Health Effects
		used in potato chip bags to keep chips fresh. It is used in rocket engines and in race cars. N_2O can be transported into the stratosphere, be deposited on the earth's surface, and be converted to other compounds by chemical reaction (17).	
Chlorofluorocarbons (CFCs)	CFCs are gases formed synthetically by replacing all hydrogen atoms in CH_4 or ethane (C_2H_6) with chlorine and/or fluorine atoms. CFCs are nontoxic, nonflammable, insoluble and chemically unreactive in the troposphere (the level of air at the earth's surface).	CFCs have no natural source but were first synthesized in 1928. They were used for refrigerants, aerosol propellants and cleaning solvents. Due to the discovery that they are able to destroy stratospheric ozone, a global effort to halt their production was undertaken and was extremely successful, so much so that levels of the major CFCs are now remaining steady or declining. However, their long atmospheric lifetimes mean that some of the CFCs will remain in the atmosphere for over 100 years (18).	In confined indoor locations, working with CFC-113 or other CFCs is thought to result in death by cardiac arrhythmia (heart frequency too high or too low) or asphyxiation.

Greenhouse Gases	Description	Sources	Health Effects
HFCs	HFCs are synthetic, man-made chemicals that are used as a substitute for CFCs. Out of all the GHGs, they are one of three groups with the highest global warming potential (GWP). The HFCs with the largest measured atmospheric abundances are (in order), fluoroform (CHF_3), 1,1,1,2-tetrafluoroethane (CH_2FCF), and 1,1-difluoroethane (CH_3CF_2). Prior to 1990, the only significant emissions were of CHF_3. CH_2FCF emissions are increasing due to its use as a refrigerant.	HFCs are manmade for applications such as automobile air conditioners and refrigerants.	No health effects are known to result from exposure to HFCs.
PFCs	PFCs have stable molecular structures and do not break down through chemical processes in the lower atmosphere. High-energy ultraviolet rays, which occur about 60 kilometers above earth's surface, are able to destroy the compounds. Because of this, PFCs have very long lifetimes, between 10,000 and 50,000 years. Two common PFCs are tetrafluoromethane (CF_4) and hexafluoroethane (C_2F_6). The EPA estimates that concentrations of CF_4 in the atmosphere are over 70 parts per trillion (ppt).	The two main sources of PFCs are primary aluminum production and semiconductor manufacture.	No health effects are known to result from exposure to PFCs.
SF_6	SF_6 is an inorganic, odorless, colorless, nontoxic, nonflammable gas. It also has the highest GWP of any gas evaluated (23,900) (19). The EPA indicates that concentrations in the 1990s were about 4 ppt.	SF_6 is used for insulation in electric power transmission and distribution equipment, in the magnesium industry, in semiconductor manufacturing, and as a tracer gas for leak detection.	In high concentrations in confined areas, the gas presents the hazard of suffocation because it displaces the oxygen needed for breathing.

Greenhouse Gases	Description	Sources	Health Effects
Nitrogen Trifluoride (NF_3)	NF_3 is a colorless gas with a distinctly moldy odor. The World Resources Institute (WRI) indicates that NF_3 has a 100-year GWP of 17,200 (20).	NF_3 is used in industrial processes and is produced in the manufacturing of semiconductors, Liquid Crystal Display (LCD) panels, types of solar panels, and chemical lasers.	Long-term or repeated exposure may affect the liver and kidneys and may cause fluorosis (21).

The potential health effects related directly to the emissions of CO_2, CH_4, and N_2O as they relate to development projects such as the proposed Project are still being debated in the scientific community. Their cumulative effects to GCC have the potential to cause adverse effects to human health. Increases in Earth's ambient temperatures would result in more intense heat waves, causing more heat-related deaths. Scientists also purport that higher ambient temperatures would increase disease survival rates and result in more widespread disease. Climate change will likely cause shifts in weather patterns, potentially resulting in devastating droughts and food shortages in some areas (22). Exhibit 2-A presents the potential impacts of global warming (23).

EXHIBIT 2-A: SUMMARY OF PROJECTED GLOBAL WARMING IMPACT, 2070-2099 (AS COMPARED WITH 1961-1990)



Source: Barbara H. Allen-Diaz. "Climate change affects us all." *University of California, Agriculture and Natural Resources*, 2009.

2.4 GLOBAL WARMING POTENTIAL

GHGs have varying GWP values. GWP of a GHG indicates the amount of warming a gas cause over a given period of time and represents the potential of a gas to trap heat in the atmosphere. CO_2 is utilized as the reference gas for GWP, and thus has a GWP of 1. CO_2 equivalent (CO_2e) is a term used for describing the difference GHGs in a common unit. CO_2e signifies the amount of CO_2 which would have the equivalent GWP.

The atmospheric lifetime and GWP of selected GHGs are summarized at Table 2-2. As shown in the table below, GWP for the 6th Assessment Report, the Intergovernmental Panel on Climate Change (IPCC)'s scientific and socio-economic assessment on climate change, range from 1 for CO_2 to 25,200 for SF_6 (24).

TABLE 2-2: GWP AND ATMOSPHERIC LIFETIME OF SELECT GHGS

Gas	Atmospheric Lifetime (years)	GWP (100-year time horizon)
		6th Assessment Report
CO_2	Multiple	1
CH_4	12 .4	28
N_2O	121	273
HFC-23	222	14,600
HFC-134a	13.4	1,526
HFC-152a	1.5	164
SF_6	3,200	25,200

2.5 GREENHOUSE GAS EMISSIONS INVENTORIES

2.5.1 GLOBAL

Worldwide anthropogenic GHG emissions are tracked by the IPCC for industrialized nations (referred to as Annex I) and developing nations (referred to as Non-Annex I). Human GHG emissions data for Annex I nations are available through 2020. Based on the latest available data, the sum of these emissions totaled approximately 28,026,643 gigagram (Gg) CO_2e[1] (25) (26) as summarized on Table 2-3.

[1] The global emissions are the sum of Annex I and non-Annex I countries, without counting Land-Use, Land-Use Change and Forestry (LULUCF). For countries without 2020 data, the United Nations' Framework Convention on Climate Change (UNFCCC) data for the most recent year were used U.N. Framework Convention on Climate Change, "Annex I Parties – GHG total without LULUCF," The most recent GHG emissions for China and India are from 2014 and 2016, respectively.

2.5.2 UNITED STATES

As noted in Table 2-3, the United States, as a single country, was the number two producer of GHG emissions in 2020.

TABLE 2-3: TOP GHG PRODUCING COUNTRIES AND THE EUROPEAN UNION [2]

Emitting Countries	GHG Emissions (Gg CO_2e)
China	12,300,200
United States	5,981,354
European Union (27-member countries)	3,706,110
India	2,839,420
Russian Federation	2,051,437
Japan	1,148,122
Total	**28,026,643**

2.5.3 STATE OF CALIFORNIA

California has significantly slowed the rate of growth of GHG emissions due to the implementation of energy efficiency programs as well as adoption of strict emission controls but is still a substantial contributor to the United States (U.S.) emissions inventory total (27). The California Air Resource Board (CARB) compiles GHG inventories for the State of California. Based upon the 2022 GHG inventory data (i.e., the latest year for which data are available) for the 2000-2020 GHG emissions period, California emitted an average 369.2 million metric tons of CO_2e per year ($MMTCO_2e/yr$) or 369,200 Gg CO_2e (6.17% of the total United States GHG emissions) (28).

2.6 EFFECTS OF CLIMATE CHANGE IN CALIFORNIA

2.6.1 PUBLIC HEALTH

Higher temperatures may increase the frequency, duration, and intensity of conditions conducive to air pollution formation. For example, days with weather conducive to ozone formation could increase from 25 to 35% under the lower warming range to 75 to 85% under the medium warming range. In addition, if global background ozone levels increase as predicted in some scenarios, it may become impossible to meet local air quality standards. Air quality could be further compromised by increases in wildfires, which emit fine particulate matter that can travel long distances, depending on wind conditions. Based on *Our Changing Climate Assessing the Risks to California by the California Climate Change Center*, large wildfires could become up to 55% more frequent if GHG emissions are not significantly reduced (29).

In addition, under the higher warming range scenario, there could be up to 100 more days per year with temperatures above 90°F in Los Angeles and 95°F in Sacramento by 2100. This is a large increase over historical patterns and approximately twice the increase projected if temperatures

[2] Used http://unfccc.int data for Annex I countries. Consulted the CAIT Climate Data Explorer in https://www.climatewatchdata.org site to reference Non-Annex I countries of China and India.

rempain within or below the lower warming range. Rising temperatures could increase the risk of death from dehydration, heat stroke/exhaustion, heart attack, stroke, and respiratory distress caused by extreme heat.

2.6.2 WATER RESOURCES

A vast network of man-made reservoirs and aqueducts captures and transports water throughout the state from northern California rivers and the Colorado River. The current distribution system relies on Sierra Nevada snowpack to supply water during the dry spring and summer months. Rising temperatures, potentially compounded by decreases in precipitation, could severely reduce spring snowpack, increasing the risk of summer water shortages.

If temperatures continue to increase, more precipitation could fall as rain instead of snow, and the snow that does fall could melt earlier, reducing the Sierra Nevada spring snowpack by as much as 70 to 90%. Under the lower warming range scenario, snowpack losses could be only half as large as those possible if temperatures were to rise to the higher warming range. How much snowpack could be lost depends in part on future precipitation patterns, the projections for which remain uncertain. However, even under the wetter climate projections, the loss of snowpack could pose challenges to water managers and hamper hydropower generation. It could also adversely affect winter tourism. Under the lower warming range, the ski season at lower elevations could be reduced by as much as a month. If temperatures reach the higher warming range and precipitation declines, there might be many years with insufficient snow for skiing and snowboarding.

The State's water supplies are also at risk from rising sea levels. An influx of saltwater could degrade California's estuaries, wetlands, and groundwater aquifers. Saltwater intrusion caused by rising sea levels is a major threat to the quality and reliability of water within the southern edge of the Sacramento/San Joaquin River Delta – a major fresh water supply.

2.6.3 AGRICULTURE

Increased temperatures could cause widespread changes to the agriculture industry reducing the quantity and quality of agricultural products statewide. First, California farmers could possibly lose as much as 25% of the water supply needed. Although higher CO_2 levels can stimulate plant production and increase plant water-use efficiency, California's farmers could face greater water demand for crops and a less reliable water supply as temperatures rise. Crop growth and development could change, as could the intensity and frequency of pest and disease outbreaks. Rising temperatures could aggravate ozone pollution, which makes plants more susceptible to disease and pests and interferes with plant growth.

Plant growth tends to be slow at low temperatures, increasing with rising temperatures up to a threshold. However, faster growth can result in less-than-optimal development for many crops, so rising temperatures could worsen the quantity and quality of yield for a number of California's agricultural products. Products likely to be most affected include wine grapes, fruits and nuts.

In addition, continued GCC could shift the ranges of existing invasive plants and weeds and alter competition patterns with native plants. Range expansion could occur in many species while

range contractions may be less likely in rapidly evolving species with significant populations already established. Should range contractions occur, new or different weed species could fill the emerging gaps. Continued GCC could alter the abundance and types of many pests, lengthen pests' breeding season, and increase pathogen growth rates.

2.6.4 FORESTS AND LANDSCAPES

GCC has the potential to intensify the current threat to forests and landscapes by increasing the risk of wildfire and altering the distribution and character of natural vegetation. If temperatures rise into the medium warming range, the risk of large wildfires in California could increase by as much as 55%, which is almost twice the increase expected if temperatures stay in the lower warming range. However, since wildfire risk is determined by a combination of factors, including precipitation, winds, temperature, and landscape and vegetation conditions, future risks will not be uniform throughout the state. In contrast, wildfires in northern California could increase by up to 90% due to decreased precipitation.

Moreover, continued GCC has the potential to alter natural ecosystems and biological diversity within the state. For example, alpine and subalpine ecosystems could decline by as much as 60 to 80% by the end of the century as a result of increasing temperatures. The productivity of the state's forests has the potential to decrease as a result of GCC.

2.6.5 RISING SEA LEVELS

Rising sea levels, more intense coastal storms, and warmer water temperatures could increasingly threaten the state's coastal regions. Under the higher warming range scenario, sea level is anticipated to rise 22 to 35 inches by 2100. Elevations of this magnitude would inundate low-lying coastal areas with saltwater, accelerate coastal erosion, threaten vital levees and inland water systems, and disrupt wetlands and natural habitats. Under the lower warming range scenario, sea level could rise 12-14 inches.

2.7 REGULATORY SETTING

2.7.1 INTERNATIONAL

Climate change is a global issue involving GHG emissions from all around the world; therefore, countries such as the ones discussed below have made an effort to reduce GHGs.

IPCC

In 1988, the United Nations (U.N.) and the World Meteorological Organization established the IPCC to assess the scientific, technical and socioeconomic information relevant to understanding the scientific basis of risk of human-induced climate change, its potential impacts, and options for adaptation and mitigation.

UNITED NATION'S FRAMEWORK CONVENTION ON CLIMATE CHANGE (UNFCCC)

On March 21, 1994, the U.S. joined a number of countries around the world in signing the Convention. Under the Convention, governments gather and share information on GHG

emissions, national policies, and best practices; launch national strategies for addressing GHG emissions and adapting to expected impacts, including the provision of financial and technological support to developing countries; and cooperate in preparing for adaptation to the impacts of climate change.

INTERNATIONAL CLIMATE CHANGE TREATIES

The Kyoto Protocol is an international agreement linked to the Convention. The major feature of the Kyoto Protocol is that it sets binding targets for 37 industrialized countries and the European community for reducing GHG emissions at an average of 5% against 1990 levels over the five-year period 2008–2012. The Convention (as discussed above) encouraged industrialized countries to stabilize emissions; however, the Protocol commits them to do so. Developed countries have contributed more emissions over the last 150 years; therefore, the Protocol places a heavier burden on developed nations under the principle of "common but differentiated responsibilities."

In 2001, President George W. Bush indicated that he would not submit the treaty to the U.S. Senate for ratification, which effectively ended American involvement in the Kyoto Protocol. In December 2009, international leaders met in Copenhagen to address the future of international climate change commitments post-Kyoto. No binding agreement was reached in Copenhagen; however, the Committee identified the long-term goal of limiting the maximum global average temperature increase to no more than 2 degrees Celsius (°C) above pre-industrial levels, subject to a review in 2015. The UN Climate Change Committee held additional meetings in Durban, South Africa in November 2011; Doha, Qatar in November 2012; and Warsaw, Poland in November 2013. The meetings are gradually gaining consensus among participants on individual climate change issues.

On September 23, 2014 more than 100 Heads of State and Government and leaders from the private sector and civil society met at the Climate Summit in New York hosted by the U.N. At the Summit, heads of government, business and civil society announced actions in areas that would have the greatest impact on reducing emissions, including climate finance, energy, transport, industry, agriculture, cities, forests, and building resilience.

Parties to the U.N. Framework Convention on Climate Change (UNFCCC) reached a landmark agreement on December 12, 2015 in Paris, charting a fundamentally new course in the two-decade-old global climate effort. Culminating a four-year negotiating round, the new treaty ends the strict differentiation between developed and developing countries that characterized earlier efforts, replacing it with a common framework that commits all countries to put forward their best efforts and to strengthen them in the years ahead. This includes, for the first time, requirements that all parties report regularly on their emissions and implementation efforts and undergo international review.

The agreement and a companion decision by parties were the key outcomes of the conference, known as the 21st session of the UNFCCC Conference of the Parties (COP) 21. Together, the Paris Agreement and the accompanying COP decision:

- Reaffirm the goal of limiting global temperature increase well below 2°C, while urging efforts to limit the increase to 1.5 degrees;
- Establish binding commitments by all parties to make "nationally determined contributions" (NDCs), and to pursue domestic measures aimed at achieving them;
- Commit all countries to report regularly on their emissions and "progress made in implementing and achieving" their NDCs, and to undergo international review;
- Commit all countries to submit new NDCs every five years, with the clear expectation that they will "represent a progression" beyond previous ones;
- Reaffirm the binding obligations of developed countries under the UNFCCC to support the efforts of developing countries, while for the first time encouraging voluntary contributions by developing countries too;
- Extend the current goal of mobilizing $100 billion a year in support by 2020 through 2025, with a new, higher goal to be set for the period after 2025;
- Extend a mechanism to address "loss and damage" resulting from climate change, which explicitly will not "involve or provide a basis for any liability or compensation;"
- Require parties engaging in international emissions trading to avoid "double counting;" and
- Call for a new mechanism, similar to the Clean Development Mechanism under the Kyoto Protocol, enabling emission reductions in one country to be counted toward another country's NDC (C2ES 2015a) (30).

Following President Biden's day one executive order, the United States officially rejoined the landmark Paris Agreement on February 19, 2021, positioning the country to once again be part of the global climate solution. Meanwhile, city, state, business, and civic leaders across the country and around the world have been ramping up efforts to drive the clean energy advances needed to meet the goals of the agreement and put the brakes on dangerous climate change.

2.7.2 NATIONAL

Prior to the last decade, there have been no concrete federal regulations of GHGs or major planning for climate change adaptation. The following are actions regarding the federal government, GHGs, and fuel efficiency.

GHG ENDANGERMENT

In *Massachusetts v. Environmental Protection Agency* 549 U.S. 497 (2007), decided on April 2, 2007, the United States Supreme Court (U.S. Court) found that four GHGs, including CO_2, are air pollutants subject to regulation under Section 202(a)(1) of the Clean Air Act (CAA). The Court held that the EPA Administrator must determine whether emissions of GHGs from new motor vehicles cause or contribute to air pollution, which may reasonably be anticipated to endanger public health or welfare, or whether the science is too uncertain to make a reasoned decision. On December 7, 2009, the EPA Administrator signed two distinct findings regarding GHGs under section 202(a) of the CAA:

- Endangerment Finding: The Administrator finds that the current and projected concentrations of the six key well-mixed GHGs— CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6—in the atmosphere threaten the public health and welfare of current and future generations.
- Cause or Contribute Finding: The Administrator finds that the combined emissions of these well-mixed GHGs from new motor vehicles and new motor vehicle engines contribute to the GHG pollution, which threatens public health and welfare.

These findings do not impose requirements on industry or other entities. However, this was a prerequisite for implementing GHG emissions standards for vehicles, as discussed in the section "Clean Vehicles" below. After a lengthy legal challenge, the U.S. Court declined to review an Appeals Court ruling that upheld the EPA Administrator's findings (31).

CLEAN VEHICLES

Congress first passed the Corporate Average Fuel Economy law in 1975 to increase the fuel economy of cars and light duty trucks. The law has become more stringent over time. On May 19, 2009, President Obama put in motion a new national policy to increase fuel economy for all new cars and trucks sold in the U.S. On April 1, 2010, the EPA and the Department of Transportation's National Highway Traffic Safety Administration (NHTSA) announced a joint final rule establishing a national program that would reduce GHG emissions and improve fuel economy for new cars and trucks sold in the U.S.

The first phase of the national program applies to passenger cars, light-duty trucks, and medium-duty (MD) passenger vehicles, covering model years 2012 through 2016. They require these vehicles to meet an estimated combined average emissions level of 250 grams of CO_2 per mile, equivalent to 35.5 miles per gallon (mpg) if the automobile industry were to meet this CO_2 level solely through fuel economy improvements. Together, these standards would cut CO_2 emissions by an estimated 960 million metric tons and 1.8 billion barrels of oil over the lifetime of the vehicles sold under the program (model years 2012–2016). The EPA and the NHTSA issued final rules on a second-phase joint rulemaking establishing national standards for light-duty vehicles for model years 2017 through 2025 in August 2012. The new standards for model years 2017 through 2025 apply to passenger cars, light-duty trucks, and MD passenger vehicles. The final standards are projected to result in an average industry fleetwide level of 163 grams/mile of CO_2 in model year 2025, which is equivalent to 54.5 mpg if achieved exclusively through fuel economy improvements.

The EPA and the U.S. Department of Transportation issued final rules for the first national standards to reduce GHG emissions and improve fuel efficiency of heavy-duty trucks (HDT) and buses on September 15, 2011, effective November 14, 2011. For combination tractors, the agencies are proposing engine and vehicle standards that begin in the 2014 model year and achieve up to a 20% reduction in CO_2 emissions and fuel consumption by the 2018 model year. For HDT and vans, the agencies are proposing separate gasoline and diesel truck standards, which phase in starting in the 2014 model year and achieve up to a 10% reduction for gasoline vehicles and a 15% reduction for diesel vehicles by the 2018 model year (12 and 17% respectively if accounting for air conditioning leakage). Lastly, for vocational vehicles, the engine and vehicle

standards would achieve up to a 10% reduction in fuel consumption and CO_2 emissions from the 2014 to 2018 model years.

On April 2, 2018, the EPA signed the Mid-term Evaluation Final Determination, which declared that the MY 2022-2025 GHG standards are not appropriate and should be revised (32). This Final Determination serves to initiate a notice to further consider appropriate standards for MY 2022-2025 light-duty vehicles. On August 2, 2018, the NHTSA in conjunction with the EPA, released a notice of proposed rulemaking, the *Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule for Model Years 2021-2026 Passenger Cars and Light Trucks* (SAFE Vehicles Rule). The SAFE Vehicles Rule was proposed to amend existing Corporate Average Fuel Economy (CAFE) and tailpipe CO_2 standards for passenger cars and light trucks and to establish new standards covering model years 2021 through 2026. As of March 31, 2020, the NHTSA and EPA finalized the SAFE Vehicle Rule which increased stringency of CAFE and CO_2 emissions standards by 1.5% each year through model year 2026 (33). On December 21, 2021, after reviewing all the public comments submitted on NHTSA's April 2021 Notice of Proposed Rulemaking, NHTSA finalizes the CAFE Preemption rulemaking to withdraw its portions of the so-called SAFE I Rule. The final rule concludes that the SAFE I Rule overstepped the agency's legal authority and established overly broad prohibitions that did not account for a variety of important state and local interests. The final rule ensures that the SAFE I Rule will no longer form an improper barrier to states exploring creative solutions to address their local communities' environmental and public health challenges (34).

On March 31, 2022, NHTSA finalized CAFE standards for MY 2024-2026. The standards for passenger cars and light trucks for MYs 2024-2025 were increased at a rate of 8% per year and then increased at a rate of 10% per year for MY 2026 vehicles. NHTSA currently projects that the revised standards would require an industry fleet-wide average of roughly 49 mpg in MY 2026 and would reduce average fuel outlays over the lifetimes of affected vehicles that provide consumers hundreds of dollars in net savings. These standards are directly responsive to the agency's statutory mandate to improve energy conservation and reduce the nation's energy dependence on foreign sources (35).

MANDATORY REPORTING OF GHGS

The Consolidated Appropriations Act of 2008, passed in December 2007, requires the establishment of mandatory GHG reporting requirements. On September 22, 2009, the EPA issued the Final Mandatory Reporting of GHGs Rule, which became effective January 1, 2010. The rule requires reporting of GHG emissions from large sources and suppliers in the U.S. and is intended to collect accurate and timely emissions data to inform future policy decisions. Under the rule, suppliers of fossil fuels or industrial GHGs, manufacturers of vehicles and engines, and facilities that emit 25,000 metric tons per year (MT/yr) or more of GHG emissions are required to submit annual reports to the EPA.

NEW SOURCE REVIEW

The EPA issued a final rule on May 13, 2010, that establishes thresholds for GHGs that define when permits under the New Source Review Prevention of Significant Deterioration and Title V Operating Permit programs are required for new and existing industrial facilities. This final rule

"tailors" the requirements of these CAA permitting programs to limit which facilities will be required to obtain Prevention of Significant Deterioration and Title V permits. In the preamble to the revisions to the Federal Code of Regulations, the EPA states:

> *"This rulemaking is necessary because without it the Prevention of Significant Deterioration and Title V requirements would apply, as of January 2, 2011, at the 100 or 250 tons per year levels provided under the CAA, greatly increasing the number of required permits, imposing undue costs on small sources, overwhelming the resources of permitting authorities, and severely impairing the functioning of the programs. EPA is relieving these resource burdens by phasing in the applicability of these programs to GHG sources, starting with the largest GHG emitters. This rule establishes two initial steps of the phase-in. The rule also commits the agency to take certain actions on future steps addressing smaller sources but excludes certain smaller sources from Prevention of Significant Deterioration and Title V permitting for GHG emissions until at least April 30, 2016."*

The EPA estimates that facilities responsible for nearly 70% of the national GHG emissions from stationary sources will be subject to permitting requirements under this rule. This includes the nation's largest GHG emitters—power plants, refineries, and cement production facilities.

STANDARDS OF PERFORMANCE FOR GHG EMISSIONS FOR NEW STATIONARY SOURCES: ELECTRIC UTILITY GENERATING UNITS

As required by a settlement agreement, the EPA proposed new performance standards for emissions of CO_2 for new, affected, fossil fuel-fired electric utility generating units on March 27, 2012. New sources greater than 25 megawatts (MW) would be required to meet an output-based standard of 1,000 pounds (lbs) of CO_2 per MW-hour (MWh), based on the performance of widely used natural gas combined cycle technology. It should be noted that on February 9, 2016, the Supreme Court issued a stay of this regulation pending litigation. Additionally, the current EPA Administrator has also signed a measure to repeal the Clean Power Plan, including the CO_2 standards. The Clean Power Plan was officially repealed on June 19, 2019, when the EPA issued the final Affordable Clean Energy rule (ACE). Under ACE, new state-specific emission guidelines were established that provided existing coal-fired electric utility generating units with achievable standards.

On January 19, 2021, the D.C. Circuit Court of Appeals ruled that the EPA's ACE Rule for GHG emissions from power plants rested on an erroneous interpretation of the CAA that barred EPA from considering measures beyond those that apply at and to an individual source. The court therefore vacated and remanded the ACE Rule and adopted a replacement rule which regulates CO_2 emissions from existing power plants, potentially again considering generation shifting and other measures to more aggressively target power sector emissions.

CAP-AND-TRADE

Cap-and-trade refers to a policy tool where emissions are limited to a certain amount and can be traded or provides flexibility on how the emitter can comply. Successful examples in the U.S.

include the Acid Rain Program and the N_2O Budget Trading Program and Clean Air Interstate Rule in the northeast. There is no federal GHG cap-and-trade program currently; however, some states have joined to create initiatives to provide a mechanism for cap-and-trade.

The Regional GHG Initiative is an effort to reduce GHGs among the states of Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New York, Rhode Island, and Vermont. Each state caps CO_2 emissions from power plants, auctions CO_2 emission allowances, and invests the proceeds in strategic energy programs that further reduce emissions, save consumers money, create jobs, and build a clean energy economy. The Initiative began in 2008 and in 2020 has retained all participating states.

The Western Climate Initiative (WCI) partner jurisdictions have developed a comprehensive initiative to reduce regional GHG emissions to 15% below 2005 levels by 2020. The partners were originally California, British Columbia, Manitoba, Ontario, and Quebec. However, Manitoba and Ontario are not currently participating. California linked with Quebec's cap-and-trade system January 1, 2014, and joint offset auctions took place in 2015. While the WCI has yet to publish whether it has successfully reached the 2020 emissions goal initiative set in 2007, SB 32, requires that California, a major partner in the WCI, adopt the goal of reducing statewide GHG emissions to 40% below the 1990 level by 2030.

SMARTWAY PROGRAM

The SmartWay Program is a public-private initiative between the EPA, large and small trucking companies, rail carriers, logistics companies, commercial manufacturers, retailers, and other federal and state agencies. Its purpose is to improve fuel efficiency and the environmental performance (reduction of both GHG emissions and air pollution) of the goods movement supply chains. SmartWay is comprised of four components (36):

1. SmartWay Transport Partnership: A partnership in which freight carriers and shippers commit to benchmark operations, track fuel consumption, and improve performance annually.
2. SmartWay Technology Program: A testing, verification, and designation program to help freight companies identify equipment, technologies, and strategies that save fuel and lower emissions.
3. SmartWay Vehicles: A program that ranks light-duty cars and small trucks and identifies superior environmental performers with the SmartWay logo.
4. SmartWay International Interests: Guidance and resources for countries seeking to develop freight sustainability programs modeled after SmartWay.

SmartWay effectively refers to requirements geared towards reducing fuel consumption. Most large trucking fleets driving newer vehicles are compliant with SmartWay design requirements. Moreover, over time, all HDTs will have to comply with the CARB GHG Regulation that is designed with the SmartWay Program in mind, to reduce GHG emissions by making them more fuel-efficient. For instance, in 2015, 53 foot or longer dry vans or refrigerated trailers equipped with a combination of SmartWay-verified low-rolling resistance tires and SmartWay-verified aerodynamic devices would obtain a total of 10% or more fuel savings over traditional trailers.

Through the SmartWay Technology Program, the EPA has evaluated the fuel saving benefits of various devices through grants, cooperative agreements, emissions and fuel economy testing, demonstration projects and technical literature review. As a result, the EPA has determined the following types of technologies provide fuel saving and/or emission reducing benefits when used properly in their designed applications, and has verified certain products:

- Idle reduction technologies – less idling of the engine when it is not needed would reduce fuel consumption.
- Aerodynamic technologies minimize drag and improve airflow over the entire tractor-trailer vehicle. Aerodynamic technologies include gap fairings that reduce turbulence between the tractor and trailer, side skirts that minimize wind under the trailer, and rear fairings that reduce turbulence and pressure drop at the rear of the trailer.
- Low rolling resistance tires can roll longer without slowing down, thereby reducing the amount of fuel used. Rolling resistance (or rolling friction or rolling drag) is the force resisting the motion when a tire rolls on a surface. The wheel will eventually slow down because of this resistance.
- Retrofit technologies include things such as diesel particulate filters, emissions upgrades (to a higher tier), etc., which would reduce emissions.
- Federal excise tax exemptions.

EXECUTIVE ORDER 13990

On January 20, 2021, Federal agencies were directed to immediately review, and take action to address, Federal regulations promulgated and other actions taken during the last 4 years that conflict with national objectives to improve public health and the environment; ensure access to clean air and water; limit exposure to dangerous chemicals and pesticides; hold polluters accountable, including those who disproportionately harm communities of color and low-income communities; reduce GHG emissions; bolster resilience to the impacts of climate change; restore and expand our national treasures and monuments; and prioritize both environmental justice and employment.

2.7.3 CALIFORNIA

LEGISLATIVE ACTIONS TO REDUCE GHGS

The State of California legislature has enacted a series of bills that constitute the most aggressive program to reduce GHGs of any state in the nation. Some legislation such as the landmark AB 32 was specifically enacted to address GHG emissions. Other legislation such as Title 24 and Title 20 energy standards were originally adopted for other purposes such as energy and water conservation, but also provide GHG reductions. This section describes the major provisions of the legislation.

AB 32

The California State Legislature enacted AB 32, which required that GHGs emitted in California be reduced to 1990 levels by the year 2020 (this goal has been met[3]). GHGs as defined under AB 32 include CO_2, CH_4, N_2O, HFCs, PFCs, and SF_6. Since AB 32 was enacted, a seventh chemical, NF_3, has also been added to the list of GHGs. CARB is the state agency charged with monitoring and regulating sources of GHGs. Pursuant to AB 32, CARB adopted regulations to achieve the maximum technologically feasible and cost-effective GHG emission reductions. AB 32 states the following:

> *"Global warming poses a serious threat to the economic well-being, public health, natural resources, and the environment of California. The potential adverse impacts of global warming include the exacerbation of air quality problems, a reduction in the quality and supply of water to the state from the Sierra snowpack, a rise in sea levels resulting in the displacement of thousands of coastal businesses and residences, damage to marine ecosystems and the natural environment, and an increase in the incidences of infectious diseases, asthma, and other human health-related problems."*

SB 32

On September 8, 2016, Governor Jerry Brown signed the SB 32 and its companion bill, AB 197. SB 32 requires the state to reduce statewide GHG emissions to 40% below 1990 levels by 2030, a reduction target that was first introduced in Executive Order B-30-15. The new legislation builds upon the AB 32 goal and provides an intermediate goal to achieving S-3-05, which sets a statewide GHG reduction target of 80% below 1990 levels by 2050. AB 197 creates a legislative committee to oversee regulators to ensure that CARB not only responds to the Governor, but also the Legislature (11).

2017 CARB SCOPING PLAN

In November 2017, CARB released the *Final 2017 Scoping Plan Update*, which identifies the State's post-2020 reduction strategy. The *Final 2017 Scoping Plan Update* reflects the 2030 target of a 40% reduction below 1990 levels, set by Executive Order B-30-15 and codified by SB 32. Key programs that the proposed Second Update builds upon include the Cap-and-Trade Regulation, the LCFS, and much cleaner cars, trucks and freight movement, utilizing cleaner, renewable energy, and strategies to reduce CH_4 emissions from agricultural and other wastes.

The *Final 2017 Scoping Plan Update* establishes a new emissions limit of 260 $MMTCO_2e$ for the year 2030, which corresponds to a 40% decrease in 1990 levels by 2030 (37).

California's climate strategy will require contributions from all sectors of the economy, including the land base, and will include enhanced focus on zero- and near-zero-emission (ZE/NZE) vehicle technologies; continued investment in renewables, including solar roofs, wind, and other

[3] Based upon the 2019 GHG inventory data (i.e., the latest year for which data are available) for the 2000-2017 GHG emissions period, California emitted an average 424.1 $MMTCO_2e$ **Invalid source specified.**. This is less than the 2020 emissions target of 431 $MMTCO_2e$.

distributed generation; greater use of low carbon fuels; integrated land conservation and development strategies; coordinated efforts to reduce emissions of short-lived climate pollutants (CH_4, black carbon, and fluorinated gases); and an increased focus on integrated land use planning to support livable, transit-connected communities and conservation of agricultural and other lands. Requirements for direct GHG reductions at refineries will further support air quality co-benefits in neighborhoods, including in disadvantaged communities historically located adjacent to these large stationary sources, as well as efforts with California's local air pollution control and air quality management districts (air districts) to tighten emission limits on a broad spectrum of industrial sources. Major elements of the *Final 2017 Scoping Plan Update* framework include:

- Implementing and/or increasing the standards of the Mobile Source Strategy, which include increasing ZEV buses and trucks.
- LCFS, with an increased stringency (18% by 2030).
- Implementing SB 350, which expands the RPS to 50% RPS and doubles energy efficiency savings by 2030.
- California Sustainable Freight Action Plan, which improves freight system efficiency, utilizes near-zero emissions technology, and deployment of zero-emission vehicles (ZEV) trucks.
- Implementing the proposed Short-Lived Climate Pollutant Strategy (SLPS), which focuses on reducing CH_4 and hydroflurocarbon emissions by 40% and anthropogenic black carbon emissions by 50% by year 2030.
- Continued implementation of SB 375.
- Post-2020 Cap-and-Trade Program that includes declining caps.
- 20% reduction in GHG emissions from refineries by 2030.
- Development of a Natural and Working Lands Action Plan to secure California's land base as a net carbon sink.

Note, however, that the *Final 2017 Scoping Plan Update* acknowledges that:

> *"[a]chieving net zero increases in GHG emissions, resulting in no contribution to GHG impacts, may not be feasible or appropriate for every project, however, and the inability of a project to mitigate its GHG emissions to net zero does not imply the project results in a substantial contribution to the cumulatively significant environmental impact of climate change under CEQA."*

In addition to the statewide strategies listed above, the *Final 2017 Scoping Plan Update* also identifies local governments as essential partners in achieving the State's long-term GHG reduction goals and identifies local actions to reduce GHG emissions. As part of the recommended actions, CARB recommends that local governments achieve a community-wide goal to achieve emissions of no more than 6 metric tons of CO_2e ($MTCO_2e$) or less per capita by 2030 and 2 $MTCO_2e$ or less per capita by 2050. For CEQA projects, CARB states that lead agencies may develop evidenced-based bright-line numeric thresholds—consistent with the Scoping Plan and the State's long-term GHG goals—and projects with emissions over that amount may be required to incorporate on-site design features and mitigation measures that avoid or minimize

project emissions to the degree feasible; or, a performance-based metric using a CAP or other plan to reduce GHG emissions is appropriate.

According to research conducted by the Lawrence Berkeley National Laboratory (LBNL) and supported by CARB, California, under its existing and proposed GHG reduction policies, could achieve the 2030 goals under SB 32. The research utilized a new, validated model known as the California LBNL GHG Analysis of Policies Spreadsheet (CALGAPS), which simulates GHG and criteria pollutant emissions in California from 2010 to 2050 in accordance to existing and future GHG-reducing policies. The CALGAPS model showed that by 2030, emissions could range from 211 to 428 $MTCO_2e$ per year ($MTCO_2e$/yr), indicating that "even if all modeled policies are not implemented, reductions could be sufficient to reduce emissions 40% below the 1990 level [of SB 32]." CALGAPS analyzed emissions through 2050 even though it did not generally account for policies that might be put in place after 2030. Although the research indicated that the emissions would not meet the State's 80% reduction goal by 2050, various combinations of policies could allow California's cumulative emissions to remain very low through 2050 (38) (39).

2022 CARB SCOPING PLAN

On December 15, 2022, CARB adopted the 2022 Scoping Plan for Achieving Carbon Neutrality (2022 Scoping Plan) (40). The 2022 Scoping Plan builds on the 2017 Scoping Plan as well as the requirements set forth by AB 1279, which directs the state to become carbon neutral no later than 2045. To achieve this statutory objective, the 2022 Scoping Plan lays out how California can reduce GHG emissions by 85% below 1990 levels and achieve carbon neutrality by 2045. The Scoping Plan scenario to do this is to "deploy a broad portfolio of existing and emerging fossil fuel alternatives and clean technologies, and align with statutes, Executive Orders, Board direction, and direction from the governor." The 2022 Scoping Plan sets one of the most aggressive approaches to reach carbon neutrality in the world. Unlike the 2017 Scoping Plan, CARB no longer includes a numeric per capita threshold and instead advocates for compliance with a local GHG reduction strategy (CAP) consistent with CEQA Guidelines section 15183.5.

The key elements of the 2022 CARB Scoping Plan focus on transportation - the regulations that will impact this sector are adopted and enforced by CARB on vehicle manufacturers and outside the jurisdiction and control of local governments. As stated in the Plan's executive summary:

> "The major element of this unprecedented transformation is the aggressive reduction of fossil fuels wherever they are currently used in California, building on and accelerating carbon reduction programs that have been in place for a decade and a half. That means rapidly moving to zero-emission transportation; electrifying the cars, buses, trains, and trucks that now constitute California's single largest source of planet-warming pollution."
>
> "[A]pproval of this plan catalyzes a number of efforts, including the development of new regulations as well as amendments to strengthen regulations and programs already in place, not just at CARB but across state agencies."

Under the 2022 Scoping Plan, the State will lead efforts to meet the 2045 carbon neutrality goal through implementation of the following objectives:

- Reimagine roadway projects that increase VMT in a way that meets community needs and reduces the need to drive.
- Double local transit capacity and service frequencies by 2030.
- Complete the High-Speed Rail (HSR) System and other elements of the intercity rail network by 2040.
- Expand and complete planned networks of high-quality active transportation infrastructure.
- Increase availability and affordability of bikes, e-bikes, scooters, and other alternatives to light-duty vehicles, prioritizing needs of underserved communities.
- Shift revenue generation for transportation projects away from the gas tax into more durable sources by 2030.
- Authorize and implement roadway pricing strategies and reallocate revenues to equitably improve transit, bicycling, and other sustainable transportation choices.
- Prioritize addressing key transit bottlenecks and other infrastructure investments to improve transit operational efficiency over investments that increase VMT.
- Develop and implement a statewide transportation demand management (TDM) framework with VMT mitigation requirements for large employers and large developments.
- Prevent uncontrolled growth of autonomous vehicle (AV) VMT, particularly zero-passenger miles.
- Channel new mobility services towards pooled use models, transit complementarity, and lower VMT outcomes.
- Establish an integrated statewide system for trip planning, booking, payment, and user accounts that enables efficient and equitable multimodal systems.
- Provide financial support for low-income and disadvantaged Californians' use of transit and new mobility services.
- Expand universal design features for new mobility services.
- Accelerate infill development in existing transportation-efficient places and deploy strategic resources to create more transportation-efficient locations.
- Encourage alignment in land use, housing, transportation, and conservation planning in adopted regional plans (RTP/SCS and RHNA) and local plans (e.g., general plans, zoning, and local transportation plans).
- Accelerate production of affordable housing in forms and locations that reduce VMT and affirmatively further fair housing policy objectives.
- Reduce or eliminate parking requirements (and/or enact parking maximums, as appropriate) and promote redevelopment of excess parking, especially in infill locations.
- Preserve and protect existing affordable housing stock and protect existing residents and businesses from displacement and climate risk.

Included in the 2022 Scoping Plan is a set of Local Actions (Appendix D to the 2022 Scoping Plan) aimed at providing local jurisdictions with tools to reduce GHGs and assist the state in meeting the ambitious targets set forth in the 2022 Scoping Plan. Appendix D to the 2022 Scoping Plan includes a section on evaluating plan-level and project-level alignment with the State's Climate Goals in CEQA GHG analyses. In this section, CARB identifies several recommendations and strategies that should be considered for new development in order to determine consistency

with the 2022 Scoping Plan. Notably, this section is focused on Residential and Mixed-Use Projects, in fact CARB states in Appendix D (page 4): "…focuses primarily on climate action plans (CAPs) and local authority over new residential development. It does not address other land use types (e.g., industrial) or air permitting."

Additionally on Page 21 in Appendix D, CARB states: "The recommendations outlined in this section apply only to residential and mixed-use development project types. California currently faces both a housing crisis and a climate crisis, which necessitates prioritizing recommendations for residential projects to address the housing crisis in a manner that simultaneously supports the State's GHG and regional air quality goals. CARB plans to continue to explore new approaches for other land use types in the future." As such, it would be inappropriate to apply the requirements contained in Appendix D of the 2022 Scoping Plan to any land use types other than residential or mixed-use residential development.

CAP-AND-TRADE PROGRAM

The Scoping Plan identifies a Cap-and-Trade Program as one of the key strategies for California to reduce GHG emissions. According to CARB, a cap-and-trade program will help put California on the path to meet its goal of achieving a 40% reduction in GHG emissions from 1990 levels by 2030. Under cap-and-trade, an overall limit on GHG emissions from capped sectors is established, and facilities subject to the cap will be able to trade permits to emit GHGs within the overall limit.

CARB adopted a California Cap-and-Trade Program pursuant to its authority under AB 32. The Cap-and-Trade Program is designed to reduce GHG emissions from regulated entities by more than 16% between 2013 and 2020, and by an additional 40% by 2030. The statewide cap for GHG emissions from the capped sectors (e.g., electricity generation, petroleum refining, and cement production) commenced in 2013 and will decline over time, achieving GHG emission reductions throughout the program's duration.

Covered entities that emit more than 25,000 $MTCO_2e$/yr must comply with the Cap-and-Trade Program. Triggering of the 25,000 $MTCO_2e$/yr "inclusion threshold" is measured against a subset of emissions reported and verified under the California Regulation for the Mandatory Reporting of GHG Emissions (Mandatory Reporting Rule or "MRR").

Under the Cap-and-Trade Program, CARB issues allowances equal to the total amount of allowable emissions over a given compliance period and distributes these to regulated entities. Covered entities are allocated free allowances in whole or part (if eligible), and may buy allowances at auction, purchase allowances from others, or purchase offset credits. Each covered entity with a compliance obligation is required to surrender "compliance instruments" for each $MTCO_2e$ of GHG they emit. There also are requirements to surrender compliance instruments covering 30% of the prior year's compliance obligation by November of each year (41).

The Cap-and-Trade Program provides a firm cap, which provides the highest certainty of achieving the 2030 target. An inherent feature of the Cap-and-Trade program is that it does not guarantee GHG emissions reductions in any discrete location or by any particular source. Rather, GHG emissions reductions are only guaranteed on an accumulative basis. As summarized by CARB in the *First Update to the Climate Change Scoping Plan*:

> *"The Cap-and-Trade Regulation gives companies the flexibility to trade allowances with others or take steps to cost-effectively reduce emissions at their own facilities. Companies that emit more have to turn in more allowances or other compliance instruments. Companies that can cut their GHG emissions have to turn in fewer allowances. But as the cap declines, aggregate emissions must be reduced. In other words, a covered entity theoretically could increase its GHG emissions every year and still comply with the Cap-and-Trade Program if there is a reduction in GHG emissions from other covered entities. Such a focus on aggregate GHG emissions is considered appropriate because climate change is a global phenomenon, and the effects of GHG emissions are considered cumulative."* (42)

The Cap-and-Trade Program covered approximately 80% of California's GHG emissions (37). The Cap-and-Trade Program covers the GHG emissions associated with electricity consumed in California, whether generated in-state or imported. Accordingly, GHG emissions associated with CEQA projects' electricity usage are covered by the Cap-and-Trade Program. The Cap-and-Trade Program also covers fuel suppliers (natural gas and propane fuel providers and transportation fuel providers) to address emissions from such fuels and from combustion of other fossil fuels not directly covered at large sources in the Program's first compliance period. The Cap-and-Trade Program covers the GHG emissions associated with the combustion of transportation fuels in California, whether refined in-state or imported.

THE SUSTAINABLE COMMUNITIES AND CLIMATE PROTECTION ACT OF 2008 (SB 375)

According to SB 375, the transportation sector is the largest contributor of GHG emissions, which emits over 40% of the total GHG emissions in California. SB 375 states, "Without improved land use and transportation policy, California will not be able to achieve the goals of AB 32." SB 375 does the following: it (1) requires metropolitan planning organizations to include sustainable community strategies in their regional transportation plans for reducing GHG emissions, (2) aligns planning for transportation and housing, and (3) creates specified incentives for the implementation of the strategies.

Concerning CEQA, SB 375, as codified in Public Resources Code Section 21159.28, states that CEQA findings for certain projects are not required to reference, describe, or discuss (1) growth inducing impacts, or (2) any project-specific or cumulative impacts from cars and light-duty truck trips generated by the project on global warming or the regional transportation network, if the project:

1. Is in an area with an approved sustainable communities strategy or an alternative planning strategy that the CARB accepts as achieving the GHG emission reduction targets.
2. Is consistent with that strategy (in designation, density, building intensity, and applicable policies).
3. Incorporates the mitigation measures required by an applicable prior environmental document.

AB 1493

The second phase of the implementation for the Pavley bill was incorporated into Amendments to the Low-Emission Vehicle Program (LEV III) or the Advanced Clean Cars (ACC) program. The ACC program combines the control of smog-causing pollutants and GHG emissions into a single

coordinated package of requirements for MY 2017 through 2025. The regulation will reduce GHGs from new cars by 34% from 2016 levels by 2025. The new rules will clean up gasoline and diesel-powered cars, and deliver increasing numbers of zero-emission technologies, such as full battery electric cars, newly emerging plug-in hybrid EV and hydrogen fuel cell cars. The package will also ensure adequate fueling infrastructure is available for the increasing numbers of hydrogen fuel cell vehicles planned for deployment in California. On March 9, EPA reinstated California's authority under the Clean Air Act to implement its own GHG emission standards for cars and light trucks, which other states can also adopt and enforce. With this authority restored, EPA will continue partnering with states to advance the next generation of clean vehicle technologies.

CLEAN ENERGY AND POLLUTION REDUCTION ACT OF 2015 (SB 350)

In October 2015, the legislature approved, and the Governor signed SB 350, which reaffirms California's commitment to reducing its GHG emissions and addressing climate change. Key provisions include an increase in the RPS, higher energy efficiency requirements for buildings, initial strategies towards a regional electricity grid, and improved infrastructure for EV charging stations. Provisions for a 50% reduction in the use of petroleum statewide were removed from the Bill because of opposition and concern that it would prevent the Bill's passage. Specifically, SB 350 requires the following to reduce statewide GHG emissions:

- Increase the amount of electricity procured from renewable energy sources from 33% to 50% by 2030, with interim targets of 40% by 2024, and 25% by 2027.
- Double the energy efficiency in existing buildings by 2030. This target will be achieved through the California Public Utility Commission (CPUC), the California Energy Commission (CEC), and local publicly owned utilities.
- Reorganize the Independent System Operator to develop more regional electrify transmission markets and to improve accessibility in these markets, which will facilitate the growth of renewable energy markets in the western United States.

2.7.3.1 EXECUTIVE ORDERS RELATED TO GHG EMISSIONS

California's Executive Branch has taken several actions to reduce GHGs through the use of Executive Orders. Although not regulatory, they set the tone for the state and guide the actions of state agencies.

EXECUTIVE ORDER B-55-18 AND SB 100

SB 100 and Executive Order B-55-18 were signed by Governor Brown on September 10, 2018. Under the existing RPS, 25% of retail sales of electricity are required to be from renewable sources by December 31, 2016, 33% by December 31, 2020, 40% by December 31, 2024, 45% by December 31, 2027, and 50% by December 31, 2030. SB 100 raises California's RPS requirement to 50% renewable resources target by December 31, 2026, and to achieve a 60% target by December 31, 2030. SB 100 also requires that retail sellers and local publicly owned electric utilities procure a minimum quantity of electricity products from eligible renewable energy resources so that the total kilowatt hours (kWh) of those products sold to their retail end-use customers achieve 44% of retail sales by December 31, 2024, 52% by December 31, 2027, and 60% by December 31, 2030. In addition to targets under AB 32 and SB 32, Executive Order B-55-18 establishes a carbon neutrality goal for the state of California by 2045; and sets a goal to maintain net negative emissions thereafter. The Executive Order directs the California Natural Resources Agency (CNRA), California EPA (CalEPA), the California Department of Food and Agriculture (CDFA), and CARB to include sequestration targets in the Natural and Working Lands Climate Change Implementation Plan consistent with the carbon neutrality goal.

EXECUTIVE ORDER S-3-05

Former California Governor Arnold Schwarzenegger announced on June 1, 2005, through Executive Order S-3-05, the following reduction targets for GHG emissions:

- By 2010, reduce GHG emissions to 2000 levels.
- By 2020, reduce GHG emissions to 1990 levels.
- By 2050, reduce GHG emissions to 80% below 1990 levels.

The 2050 reduction goal represents what some scientists believe is necessary to reach levels that will stabilize the climate. The 2020 goal was established to be a mid-term target. Because this is an executive order, the goals are not legally enforceable for local governments or the private sector.

EXECUTIVE ORDER S-01-07 (LCFS)

Governor Schwarzenegger signed Executive Order S-01-07 on January 18, 2007. The order mandates that a statewide goal shall be established to reduce the carbon intensity of California's transportation fuels by at least 10% by 2020. CARB adopted the LCFS on April 23, 2009.

After a series of legal changes, in order to address the Court ruling, CARB was required to bring a new LCFS regulation to the Board for consideration in February 2015. The proposed LCFS regulation was required to contain revisions to the 2010 LCFS as well as new provisions designed to foster investments in the production of the low-carbon intensity fuels, offer additional

flexibility to regulated parties, update critical technical information, simplify and streamline program operations, and enhance enforcement. On November 16, 2015, the Office of Administrative Law (OAL) approved the Final Rulemaking Package. The new LCFS regulation became effective on January 1, 2016.

In 2018, CARB approved amendments to the regulation, which included strengthening the carbon intensity benchmarks through 2030 in compliance with the SB 32 GHG emissions reduction target for 2030. The amendments included crediting opportunities to promote zero emission vehicle adoption, alternative jet fuel, carbon capture and sequestration, and advanced technologies to achieve deep decarbonization in the transportation sector (43).

EXECUTIVE ORDER S-13-08

Executive Order S-13-08 states that "climate change in California during the next century is expected to shift precipitation patterns, accelerate sea level rise and increase temperatures, thereby posing a serious threat to California's economy, to the health and welfare of its population and to its natural resources." Pursuant to the requirements in the Order, the 2009 California Climate Adaptation Strategy (CNRA 2009) was adopted, which is the "…first statewide, multi-sector, region-specific, and information-based climate change adaptation strategy in the United States." Objectives include analyzing risks of climate change in California, identifying and exploring strategies to adapt to climate change, and specifying a direction for future research.

EXECUTIVE ORDER B-30-15

On April 29, 2015, Governor Brown issued an executive order to establish a California GHG reduction target of 40% below 1990 levels by 2030. The Governor's executive order aligned California's GHG reduction targets with those of leading international governments ahead of the U.N. Climate Change Conference in Paris late 2015. The Order sets a new interim statewide GHG emission reduction target to reduce GHG emissions to 40% below 1990 levels by 2030 in order to ensure California meets its target of reducing GHG emissions to 80% below 1990 levels by 2050 and directs CARB to update the *2017 Scoping Plan* to express the 2030 target in terms of $MMTCO_2e$. The Order also requires the state's climate adaptation plan to be updated every three years, and for the State to continue its climate change research program, among other provisions. As with Executive Order S-3-05, this Order is not legally enforceable as to local governments and the private sector. Legislation that would update AB 32 to make post 2020 targets and requirements a mandate is in process in the State Legislature.

2.7.3.2 CALIFORNIA REGULATIONS AND BUILDING CODES

California has a long history of adopting regulations to improve energy efficiency in new and remodeled buildings. These regulations have kept California's energy consumption relatively flat even with rapid population growth.

TITLE 20 CCR SECTIONS 1601 ET SEQ. – APPLIANCE EFFICIENCY REGULATIONS

CCR, Title 20: Division 2, Chapter 4, Article 4, Sections 1601-1608: Appliance Efficiency Regulations regulates the sale of appliances in California. The Appliance Efficiency Regulations include standards for both federally regulated appliances and non-federally regulated appliances.

23 categories of appliances are included in the scope of these regulations. The standards within these regulations apply to appliances that are sold or offered for sale in California, except those sold wholesale in California for final retail sale outside the state and those designed and sold exclusively for use in recreational vehicles or other mobile equipment (CEC 2012).

TITLE 24 CCR PART 6 – CALIFORNIA ENERGY CODE

The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods.

TITLE 24 CCR PART 11 – CALIFORNIA GREEN BUILDING STANDARDS CODE

California Code of Regulations (CCR) Title 24 Part 6: The California Energy Code was first adopted in 1978 in response to a legislative mandate to reduce California's energy consumption.

The standards are updated periodically to allow consideration and possible incorporation of new energy efficient technologies and methods. CCR, Title 24, Part 11: California Green Building Standards Code (CALGreen) is a comprehensive and uniform regulatory code for all residential, commercial, and school buildings that went in effect on August 1, 2009, and is administered by the California Building Standards Commission.

CALGreen is updated on a regular basis, with the most recent approved update consisting of the 2022 California Green Building Code Standards that became effective on January 1, 2023. The CEC anticipates that the 2022 energy code will provide $1.5 billion in consumer benefits and reduce GHG emissions by 10 million metric tons (44). The Project would be required to comply with the applicable standards in place at the time plan check submittals are made. These require, among other items (45):

NONRESIDENTIAL MANDATORY MEASURES

- Short-term bicycle parking. If the new project or an additional alteration is anticipated to generate visitor traffic, provide permanently anchored bicycle racks within 200 feet of the visitors' entrance, readily visible to passers-by, for 5% of new visitor motorized vehicle parking spaces being added, with a minimum of one two-bike capacity rack (5.106.4.1.1).
- Long-term bicycle parking. For new buildings with tenant spaces that have 10 or more tenant-occupants, provide secure bicycle parking for 5% of the tenant-occupant vehicular parking spaces with a minimum of one bicycle parking facility (5.106.4.1.2).
- Designated parking for clean air vehicles. In new projects or additions to alterations that add 10 or more vehicular parking spaces, provide designated parking for any combination of low-emitting, fuel-efficient and carpool/van pool vehicles as shown in Table 5.106.5.2 (5.106.5.2).

- EV charging stations. New construction shall facilitate the future installation of EV supply equipment. The compliance requires empty raceways for future conduit and documentation that the electrical system has adequate capacity for the future load. The number of spaces to be provided for is contained in Table 5.106. 5.3.3 (5.106.5.3). Additionally, Table 5.106.5.4.1 specifies requirements for the installation of raceway conduit and panel power requirements for medium- and heavy-duty electric vehicle supply equipment for warehouses, grocery stores, and retail stores.
- Outdoor light pollution reduction. Outdoor lighting systems shall be designed to meet the backlight, uplight and glare ratings per Table 5.106.8 (5.106.8).
- Construction waste management. Recycle and/or salvage for reuse a minimum of 65% of the nonhazardous construction and demolition waste in accordance with Section 5.408.1.1. 5.405.1.2, or 5.408.1.3; or meet a local construction and demolition waste management ordinance, whichever is more stringent (5.408.1).
- Excavated soil and land clearing debris. 100% of trees, stumps, rocks and associated vegetation and soils resulting primarily from land clearing shall be reuse or recycled. For a phased project, such material may be stockpiled on site until the storage site is developed (5.408.3).
- Recycling by Occupants. Provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive (5.410.1).
- Water conserving plumbing fixtures and fittings. Plumbing fixtures (water closets and urinals) and fittings (faucets and showerheads) shall comply with the following:
    - Water Closets. The effective flush volume of all water closets shall not exceed 1.28 gallons per flush (5.303.3.1)
    - Urinals. The effective flush volume of wall-mounted urinals shall not exceed 0.125 gallons per flush (5.303.3.2.1). The effective flush volume of floor- mounted or other urinals shall not exceed 0.5 gallons per flush (5.303.3.2.2).
    - Showerheads. Single showerheads shall have a minimum flow rate of not more than 1.8 gallons per minute and 80 psi (5.303.3.3.1). When a shower is served by more than one showerhead, the combine flow rate of all showerheads and/or other shower outlets controlled by a single valve shall not exceed 1.8 gallons per minute at 80 psi (5.303.3.3.2).
    - Faucets and fountains. Nonresidential lavatory faucets shall have a maximum flow rate of not more than 0.5 gallons per minute at 60 psi (5.303.3.4.1). Kitchen faucets shall have a maximum flow rate of not more than 1.8 gallons per minute of 60 psi (5.303.3.4.2). Wash fountains shall have a maximum flow rate of not more than 1.8 gallons per minute (5.303.3.4.3). Metering faucets shall not deliver more than 0.20 gallons per cycle (5.303.3.4.4). Metering faucets for wash fountains shall have a maximum flow rate not more than 0.20 gallons per cycle (5.303.3.4.5).
- Outdoor potable water uses in landscaped areas. Nonresidential developments shall comply with a local water efficient landscape ordinance or the current California Department of Water Resources' Model Water Efficient Landscape Ordinance (MWELO), whichever is more stringent (5.304.1).

- Water meters. Separate submeters or metering devices shall be installed for new buildings or additions in excess of 50,000 sf or for excess consumption where any tenant within a new building or within an addition that is project to consume more than 1,000 gallons per day (GPD) (5.303.1.1 and 5.303.1.2).
- Outdoor water uses in rehabilitated landscape projects equal or greater than 2,500 sf. Rehabilitated landscape projects with an aggregate landscape area equal to or greater than 2,500 sf requiring a building or landscape permit (5.304.3).
- Commissioning. For new buildings 10,000 sf and over, building commissioning shall be included in the design and construction processes of the building project to verify that the building systems and components meet the owner's or owner representative's project requirements (5.410.2).

MWELO

The MWELO was required by AB 1881, the Water Conservation Act. The bill required local agencies to adopt a local landscape ordinance at least as effective in conserving water as the Model Ordinance by January 1, 2010. Governor Brown's Drought Executive Order of April 1, 2015 (Executive Order B-29-15) directed Department of Water Resources (DWR) to update the Ordinance through expedited regulation. The California Water Commission approved the revised Ordinance on July 15, 2015 effective December 15, 2015. New development projects that include landscape areas of 500 sf or more are subject to the Ordinance. The update requires:

- More efficient irrigation systems;
- Incentives for graywater usage;
- Improvements in on-site stormwater capture;
- Limiting the portion of landscapes that can be planted with high water use plants; and
- Reporting requirements for local agencies.

CARB REFRIGERANT MANAGEMENT PROGRAM

CARB adopted a regulation in 2009 to reduce refrigerant GHG emissions from stationary sources through refrigerant leak detection and monitoring, leak repair, system retirement and retrofitting, reporting and recordkeeping, and proper refrigerant cylinder use, sale, and disposal. The regulation is set forth in sections 95380 to 95398 of Title 17, CCR. The rules implementing the regulation establish a limit on statewide GHG emissions from stationary facilities with refrigeration systems with more than 50 lbs of a high GWP refrigerant. The refrigerant management program is designed to (1) reduce emissions of high-GWP GHG refrigerants from leaky stationary, non-residential refrigeration equipment; (2) reduce emissions from the installation and servicing of refrigeration and air-conditioning appliances using high-GWP refrigerants; and (3) verify GHG emission reductions.

TRACTOR-TRAILER GHG REGULATION

The tractors and trailers subject to this regulation must either use EPA SmartWay certified tractors and trailers or retrofit their existing fleet with SmartWay verified technologies. The regulation applies primarily to owners of 53-foot or longer box-type trailers, including both dry-van and refrigerated-van trailers, and owners of the HD tractors that pull them on California

highways. These owners are responsible for replacing or retrofitting their affected vehicles with compliant aerodynamic technologies and low rolling resistance tires. Sleeper cab tractors model year 2011 and later must be SmartWay certified. All other tractors must use SmartWay verified low rolling resistance tires. There are also requirements for trailers to have low rolling resistance tires and aerodynamic devices.

PHASE I AND 2 HEAVY-DUTY VEHICLE GHG STANDARDS

In September 2011, CARB has adopted a regulation for GHG emissions from HDTs and engines sold in California. It establishes GHG emission limits on truck and engine manufacturers and harmonizes with the EPA rule for new trucks and engines nationally. Existing HD vehicle regulations in California include engine criteria emission standards, tractor-trailer GHG requirements to implement SmartWay strategies (i.e., the Heavy-Duty Tractor-Trailer GHG Regulation), and in-use fleet retrofit requirements such as the Truck and Bus Regulation. The EPA rule has compliance requirements for new compression and spark ignition engines, as well as trucks from Class 2b through Class 8. Compliance requirements began with MY 2014 with stringency levels increasing through MY 2018. The rule organizes truck compliance into three groupings, which include a) HD pickups and vans; b) vocational vehicles; and c) combination tractors. The EPA rule does not regulate trailers.

CARB staff has worked jointly with the EPA and the NHTSA on the next phase of federal GHG emission standards for medium-duty trucks (MDT) and HDT vehicles, called federal Phase 2. The federal Phase 2 standards were built on the improvements in engine and vehicle efficiency required by the Phase 1 emission standards and represent a significant opportunity to achieve further GHG reductions for 2018 and later MY HDT vehicles, including trailers. The EPA and NHTSA have proposed to roll back GHG and fuel economy standards for cars and light-duty trucks, which suggests a similar rollback of Phase 2 standards for MDT and HDT vehicles may be pursued.

SB 97 AND THE CEQA GUIDELINES UPDATE

Passed in August 2007, SB 97 added Section 21083.05 to the Public Resources Code. The code states "(a) On or before July 1, 2009, the Office of Planning and Research (OPR) shall prepare, develop, and transmit to the Resources Agency guidelines for the mitigation of GHG emissions or the effects of GHG emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption. (b) On or before January 1, 2010, the Resources Agency shall certify and adopt guidelines prepared and developed by the OPR pursuant to subdivision (a)."

In 2012, Public Resources Code Section 21083.05 was amended to state:

> *"The Office of Planning and Research and the Natural Resources Agency shall periodically update the guidelines for the mitigation of greenhouse gas emissions or the effects of greenhouse gas emissions as required by this division, including, but not limited to, effects associated with transportation or energy consumption, to incorporate new information or criteria established by the State Air Resources Board pursuant to Division 25.5 (commencing with Section 38500) of the Health and Safety Code."*

On December 28, 2018, the Natural Resources Agency announced the OAL approved the amendments to the *CEQA Guidelines* for implementing CEQA. The CEQA Amendments provide guidance to public agencies regarding the analysis and mitigation of the effects of GHG emissions in CEQA documents. The CEQA Amendments fit within the existing CEQA framework by amending existing *CEQA Guidelines* to reference climate change.

Section 15064.4 was added the *CEQA Guidelines* and states that in determining the significance of a project's GHG emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project's emissions to the effects of climate change. A project's incremental contribution may be cumulatively considerable even if it appears relatively insignificant compared to statewide, national, or global emissions. The agency's analysis should consider a timeframe that is appropriate for the project. The agency's analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. Additionally, a lead agency may use a model or methodology to estimate GHG emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project's incremental contribution to climate change. The lead agency must support its selection of a model or methodology with substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use (46).

2.7.4 REGIONAL

The project is within the South Coast Air Basin (SCAB), which is under the jurisdiction of the SCAQMD.

SCAQMD

SCAQMD is the agency responsible for air quality planning and regulation in the SCAB. The SCAQMD addresses the impacts to climate change of projects subject to SCAQMD permit as a lead agency if they are the only agency having discretionary approval for the project and acts as a responsible agency when a land use agency must also approve discretionary permits for the project. The SCAQMD acts as an expert commenting agency for impacts to air quality. This expertise carries over to GHG emissions, so the agency helps local land use agencies through the development of models and emission thresholds that can be used to address GHG emissions.

In 2008, SCAQMD formed a Working Group to identify GHG emissions thresholds for land use projects that could be used by local lead agencies in the SCAB. The Working Group developed several different options that are contained in the SCAQMD Draft Guidance Document – Interim CEQA GHG Significance Threshold, that could be applied by lead agencies. The working group has not provided additional guidance since release of the interim guidance in 2008. The SCAQMD Board has not approved the thresholds; however, the Guidance Document provides substantial evidence supporting the approaches to significance of GHG emissions that can be considered by the lead agency in adopting its own threshold. The current interim thresholds consist of the following tiered approach:

- Tier 1 consists of evaluating whether or not the project qualifies for any applicable exemption under CEQA.

- Tier 2 consists of determining whether the project is consistent with a GHG reduction plan. If a project is consistent with a qualifying local GHG reduction plan, it does not have significant GHG emissions.
- Tier 3 consists of screening values, which the lead agency can choose, but must be consistent with all projects within its jurisdiction. A project's construction emissions are averaged over 30 years and are added to the project's operational emissions. If a project's emissions are below one of the following screening thresholds, then the project is less than significant:
    - Residential and Commercial land use: 3,000 $MTCO_2e$/yr
    - Industrial land use: 10,000 $MTCO_2e$/yr
    - Based on land use type: residential: 3,500 $MTCO_2e$/yr; commercial: 1,400 $MTCO_2e$/yr; or mixed use: 3,000 $MTCO_2e$/yr
- Tier 4 has the following options:
    - Option 1: Reduce Business-as-Usual (BAU) emissions by a certain percentage; this percentage is currently undefined.
    - Option 2: Early implementation of applicable AB 32 Scoping Plan measures
    - Option 3: 2020 target for service populations (SP), which includes residents and employees: 4.8 $MTCO_2e$ per SP per year for projects and 6.6 $MTCO_2e$ per SP per year for plans;
    - Option 3, 2035 target: 3.0 $MTCO_2e$ per SP per year for projects and 4.1 $MTCO_2e$ per SP per year for plans
- Tier 5 involves mitigation offsets to achieve target significance threshold.

The SCAQMD's interim thresholds used the Executive Order S-3-05-year 2050 goal as the basis for the Tier 3 screening level. Achieving the Executive Order's objective would contribute to worldwide efforts to cap CO_2 concentrations at 450 ppm, thus stabilizing global climate.

SCAQMD only has authority over GHG emissions from development projects that include air quality permits. At this time, it is unknown if the project would include stationary sources of emissions subject to SCAQMD permits. Notwithstanding, if the Project requires a stationary permit, it would be subject to the applicable SCAQMD regulations.

SCAQMD Regulation XXVII, adopted in 2009 includes the following rules:

- Rule 2700 defines terms and post global warming potentials.
- Rule 2701, SoCal Climate Solutions Exchange, establishes a voluntary program to encourage, quantify, and certify voluntary, high quality certified GHG emission reductions in the SCAQMD.
- Rule 2702, GHG Reduction Program created a program to produce GHG emission reductions within the SCAQMD. The SCAQMD will fund projects through contracts in response to requests for proposals or purchase reductions from other parties.

3 PROJECT GREENHOUSE GAS IMPACT

3.1 INTRODUCTION

The Project has been evaluated to determine if it will result in a significant GHG impact. The significance of these potential impacts is described in the following section.

3.2 STANDARDS OF SIGNIFICANCE

The criteria used to determine the significance of potential Project-related GHG impacts are taken from the Initial Study Checklist in Appendix G of the State CEQA Guidelines (14 California Code of Regulations §§15000, et seq.). Based on these thresholds, a project would result in a significant impact related to GHG if it would (1):

- Generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?
- Conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

3.3 CALIFORNIA EMISSIONS ESTIMATOR MODEL™ EMPLOYED TO ANALYZE GHG EMISSIONS

In May 2023 California Air Pollution Control Officers Association (CAPCOA) in conjunction with other California air districts, including SCAQMD, released the latest version of the CalEEMod Version 2022.1.1.12. The purpose of this model is to calculate construction-source and operational-source criteria pollutant (VOCs, NO_X, SO_X, CO, PM_{10}, and $PM_{2.5}$) and GHG emissions from direct and indirect sources; and quantify applicable air quality and GHG reductions achieved from mitigation (47). Accordingly, the latest version of CalEEMod has been used for this Project to determine construction and operational air quality emissions. CalEEMod output for both construction and operational scenarios is provided in Appendix 3.1.

3.4 CONSTRUCTION LIFE-CYCLE ANALYSIS NOT REQUIRED

A full life-cycle analysis (LCA) for construction and operational activity is not included in this analysis due to the lack of consensus guidance on LCA methodology at this time (48). Life-cycle analysis (i.e., assessing economy-wide GHG emissions from the processes in manufacturing and transporting all raw materials used in the project development, infrastructure and on-going operations) depends on emission factors or econometric factors that are not well established for all processes. At this time, an LCA would be extremely speculative and thus has not been prepared.

Additionally, the SCAQMD recommends analyzing direct and indirect project GHG emissions generated within California and not life-cycle emissions because the life-cycle effects from a project could occur outside of California, might not be very well understood or documented, and would be challenging to mitigate (49). Additionally, the science to calculate life cycle emissions

is not yet established or well defined; therefore, SCAQMD has not recommended, and is not requiring, life-cycle emissions analysis.

3.5 CONSTRUCTION EMISSIONS

Project construction activities would result in emissions of CO_2 and CH_4. The report *Replenish Big Bear Program Air Quality Impact Analysis Report* (AQIA) (Urban Crossroads, Inc.) contains detailed information regarding construction activity (50).

3.6 OPERATIONAL EMISSIONS

In terms of operational GHG emissions, the proposed Project involves the construction of monitoring wells, conveyance facilities and ancillary facilities, evaporation ponds, advanced water purification facilities, and associated improvements. The proposed Project does not include any substantive new stationary or mobile sources of emissions, and therefore, by its very nature, will not generate quantifiable GHG emissions from Project operations. The Project does not propose a trip-generating land use or facilities that would generate any substantive amount of on-going GHG emissions. While it is anticipated that the Project would require intermittent maintenance to be, such maintenance would be minimal requiring a negligible amount of traffic trips on an annual basis. Additionally, based on information provided by BBARWA and the Project Team, the Project will include the installation of solar, which is expected to generate approximately 3,652,117 kWh per year. Therefore, there is no significant operational impact expected, as shown on Table 3-1.

3.7 EMISSIONS SUMMARY

As shown in Table 3-1, the Project will result in approximately 1,499.63 $MTCO_2e$/yr from construction and operational activities.

TABLE 3-1: PROJECT GHG EMISSIONS

Emission Source	Emissions (MT/yr)				
	CO_2	CH_4	N_2O	Refrigerants	Total CO_2e
Annual construction-related emissions amortized over 30 years	361.89	1.94E-02	2.38E-02	2.10E-01	369.69
Mobile Source	0.10	0.00	0.00	0.00	0.10
Area Source	0.81	0.00	0.00	0.00	0.81
Energy Source	44.95	4.61	0.00	0.00	45.08
Water Usage	834.41	0.06	0.01	0.00	837.91
Waste	3.35	0.34	0.00	0.00	11.74
Stationary Source	233.51	166.79	0.01	0.00	234.28
Total CO_2e (All Sources)	**1,499.63**				

Source: CalEEMod output, See Appendices 3.1 through 3.5 for detailed model outputs.

3.8 GREENHOUSE GAS EMISSIONS FINDINGS AND RECOMMENDATIONS

GHG Impact #1: The Project would generate direct or indirect GHG emission that would result in a significant impact on the environment.

The Big Bear Area Regional Wastewater Agency has not adopted its own numeric threshold of significance for determining impacts with respect to GHG emissions. A screening threshold of 3,000 $MTCO_2e$/yr or 10,000 $MTCO_2e$/yr to determine if additional analysis is required is an acceptable approach. This approach is a widely accepted screening threshold used by numerous cities and counties in the SCAB and is based on the SCAQMD staff's proposed GHG screening threshold for stationary source emissions for non-industrial projects, as described in the SCAQMD's *Interim CEQA GHG Significance Threshold for Stationary Sources, Rules and Plans* (SCAQMD Interim GHG Threshold). The SCAQMD Interim GHG Threshold identifies a screening threshold to determine whether additional analysis is required (51).

The Project will result in approximately 1,499.63 $MTCO_2e$/yr from construction and operational activities. As such, the Project would not exceed the SCAQMD's recommended numeric threshold of 3,000 $MTCO_2e$ or 10,000 $MTCO_2e$/yr if it were applied. Thus, the Project would not result in a cumulatively considerable impact with respect to GHG emissions.

GHG Impact #2: The Project would not conflict with any applicable plan, policy or regulation of an agency adopted for the purpose of reducing the emissions of GHG.

As discussed above, the Project involves construction activity and does not propose a trip-generating land use or facilities that would generate any substantive amount of on-going GHG emissions. As presented in Table 3-1, the Project's GHG emissions are below the 3,000 $MTCO_2e$/yr and 10,000 $MTCO_2e$/yr thresholds. As concluded in Impact Statement GHG-1 the proposed project would not have the potential to generate a significant amount of GHGs emissions. As such, the proposed Project will not conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. Impacts are considered less than significant in this regard.

APPENDIX 3.1:

CALEEMOD REPLENISH BIG BEAR COMPONENT 1 UNMITIGATED EMISSIONS MODEL OUTPUTS

15309-WWTP Upgrades (Unmitigated) Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.3. Construction Emissions by Year, Mitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

2.6. Operations Emissions by Sector, Mitigated

3. Construction Emissions Details

3.1. Linear, Grading & Excavation (2026) - Unmitigated

3.2. Linear, Grading & Excavation (2026) - Mitigated

3.3. Linear, Grading & Excavation (2027) - Unmitigated

3.4. Linear, Grading & Excavation (2027) - Mitigated

3.5. Demolition (2025) - Unmitigated

3.6. Demolition (2025) - Mitigated

3.7. Building Construction (2025) - Unmitigated

3.8. Building Construction (2025) - Mitigated

3.9. Building Construction (2026) - Unmitigated

3.10. Building Construction (2026) - Mitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.1.2. Mitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.2. Electricity Emissions By Land Use - Mitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.2.4. Natural Gas Emissions By Land Use - Mitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.3.2. Mitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.4.2. Mitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.5.2. Mitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.6.2. Mitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.7.2. Mitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.8.2. Mitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.9.2. Mitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Building Construction	0.00	0.00	60,000	20,000	7,684

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (Cubic Yards)	Material Exported (Cubic Yards)	Acres Graded (acres)	Material Demolished (Ton of Debris)	Acres Paved (acres)
Linear, Grading & Excavation	—	—	0.14	0.00	—

Demolition	—	1,350	0.14	3,000	—
Building Construction	—	8,000	581	0.00	—

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction
Water Exposed Area	3	74%	74%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Unrefrigerated Warehouse-Rail	0.00	0%
Other Non-Asphalt Surfaces	2.00	0%
Parking Lot	0.50	100%
User Defined Linear	0.14	100%
Other Asphalt Surfaces	0.44	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2025	0.00	565	0.03	< 0.005
2026	0.00	482	0.03	< 0.005
2027	0.00	482	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year

Unrefrigerated Warehouse-Rail	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Other Non-Asphalt Surfaces	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Parking Lot	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.

Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A

Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6

Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Based on Client Provided data and construction schedule
Construction: Off-Road Equipment	Client Provided construction equipment list
Construction: Trips and VMT	Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.
Operations: Vehicle Data	No trips data available
Operations: Architectural Coatings	SCAQMD Rule 1113
Construction: Dust From Material Movement	Export expected per Project data

Construction: Architectural Coatings	SCAQMD Rule 1113
Operations: Energy Use	Electricity adjusted based on client provided data
Operations: Water and Waste Water	Taken from 2022 Lake Analysis report

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list
Construction: Trips and VMT	13 haul trucks and 2 worker trucks accounted for in Linear, Grading & Excavation Phase in addition to default CalEEMod hauling trucks. Per Project applicant, the hauling trucks would travel a distance of up to 100 miles round trip, as such hauling for both the Linear, Grading & Excavation and Demolition phase was adjusted to 100 miles.

APPENDIX 3.3:

CALEEMOD REPLENISH BIG BEAR COMPONENT 3 UNMITIGATED EMISSIONS MODEL OUTPUTS

15309-Shay Ponds (Unmitigated) Detailed Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

3. Construction Emissions Details

3.1. Linear, Grading & Excavation (2025) - Unmitigated

3.3. Linear, Grading & Excavation (2026) - Unmitigated

3.5. Linear, Drainage, Utilities, & Sub-Grade (2026) - Unmitigated

4. Operations Emissions Details

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.3. Construction Vehicles

5.3.1. Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

6.2. Initial Climate Risk Scores

6.3. Adjusted Climate Risk Scores

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

7.2. Healthy Places Index Scores

7.3. Overall Health & Equity Scores

7.4. Health & Equity Measures

7.5. Evaluation Scorecard

7.6. Health & Equity Custom Measures

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15309-Shay Ponds (Unmitigated)
Construction Start Date	5/1/2025
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	3.30
Precipitation (days)	1.80
Location	34.253674, -116.80784
County	San Bernardino-South Coast
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5156
EDFZ	10
Electric Utility	Bear Valley Electric Service
Gas Utility	Southwest Gas Corp.
App Version	2022.1.1.18

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
User Defined Linear	1.20	Mile	0.65	0.00	—	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

5.18.1.1. Unmitigated

Biomass Cover Type	Initial Acres	Final Acres

5.18.2. Sequestration

5.18.2.1. Unmitigated

Tree Type	Number	Electricity Saved (kWh/year)	Natural Gas Saved (btu/year)

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	39.3	annual days of extreme heat
Extreme Precipitation	4.40	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	31.0	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A

Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00

Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1
Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461
High school enrollment	100
Preschool enrollment	95.7141024
Transportation	—
Auto Access	86.34672142
Active commuting	8.161170281

Social	—
2-parent households	29.38534582
Voting	73.38637239
Neighborhood	—
Alcohol availability	87.1423072
Park access	51.00731426
Retail density	9.110740408
Supermarket access	10.57359168
Tree canopy	85.29449506
Housing	—
Homeownership	77.15898884
Housing habitability	49.54446298
Low-inc homeowner severe housing cost burden	35.91684845
Low-inc renter severe housing cost burden	3.708456307
Uncrowded housing	96.93314513
Health Outcomes	—
Insured adults	30.92518927
Arthritis	0.0
Asthma ER Admissions	46.4
High Blood Pressure	0.0
Cancer (excluding skin)	0.0
Asthma	0.0
Coronary Heart Disease	0.0
Chronic Obstructive Pulmonary Disease	0.0
Diagnosed Diabetes	0.0
Life Expectancy at Birth	16.7
Cognitively Disabled	5.2

Physically Disabled	5.0
Heart Attack ER Admissions	10.8
Mental Health Not Good	0.0
Chronic Kidney Disease	0.0
Obesity	0.0

Other Decision Support	—

2016 Voting	81.4

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided Schedule
Construction: Off-Road Equipment	Client Provided Equipment list
Construction: Trips and VMT	13 haul trucks and 2 worker trucks accounted for in Linear, Grading & Excavation Phase.

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.6	annual days of extreme heat
Extreme Precipitation	7.50	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	35.6	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A

Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	97.6
AQ-PM	1.68
AQ-DPM	4.41
Drinking Water	60.7
Lead Risk Housing	11.6
Pesticides	11.0
Toxic Releases	8.39
Traffic	1.35
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	0.00
Impaired Water Bodies	0.00
Solid Waste	11.6
Sensitive Population	—
Asthma	63.6
Cardio-vascular	92.9
Low Birth Weights	66.3
Socioeconomic Factor Indicators	—
Education	33.5
Housing	22.1

Linguistic	8.49
Poverty	67.0
Unemployment	64.5

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	54.07416913
Employed	2.34826126
Median HI	47.09354549
Education	—
Bachelor's or higher	24.38085461

7.3. Overall Health & Equity Scores

Metric	Result for Project Census Tract
CalEnviroScreen 4.0 Score for Project Location (a)	19.0
Healthy Places Index Score for Project Location (b)	41.0
Project Located in a Designated Disadvantaged Community (Senate Bill 535)	No
Project Located in a Low-Income Community (Assembly Bill 1550)	No
Project Located in a Community Air Protection Program Community (Assembly Bill 617)	No

a: The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.
b: The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

7.4. Health & Equity Measures

No Health & Equity Measures selected.

7.5. Evaluation Scorecard

Health & Equity Evaluation Scorecard not completed.

7.6. Health & Equity Custom Measures

No Health & Equity Custom Measures created.

8. User Changes to Default Data

Screen	Justification
Construction: Construction Phases	Client Provided schedule
Construction: Off-Road Equipment	Client provided equipment list
Construction: Trips and VMT	Client provided total worker trips and hauling trips which equals 8,000 round trips.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	15309-Sand Canyon
Construction Start Date	5/1/2025
Operational Year	2027
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.50
Precipitation (days)	1.80
Location	34.224799, -116.85662
County	San Bernardino-South Coast
City	Unincorporated
Air District	South Coast AQMD
Air Basin	South Coast
TAZ	5157
EDFZ	10
Electric Utility	Southern California Edison
Gas Utility	Southwest Gas Corp.
App Version	2022.1.1.14

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description

User Defined Linear	1.37	Mile	0.74	0.00	—	—	—	Pipeline
Other Non-Asphalt Surfaces	2.00	Acre	2.00	0.00	0.00	—	—	Pump/Monitoring Wells
Parking Lot	0.50	Acre	0.50	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

No measures selected

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

6. Climate Risk Detailed Report

6.1. Climate Risk Summary

Cal-Adapt midcentury 2040–2059 average projections for four hazards are reported below for your project location. These are under Representation Concentration Pathway (RCP) 8.5 which assumes GHG emissions will continue to rise strongly through 2050 and then plateau around 2100.

Climate Hazard	Result for Project Location	Unit
Temperature and Extreme Heat	38.1	annual days of extreme heat
Extreme Precipitation	8.60	annual days with precipitation above 20 mm
Sea Level Rise	0.00	meters of inundation depth
Wildfire	32.4	annual hectares burned

Temperature and Extreme Heat data are for grid cell in which your project are located. The projection is based on the 98th historical percentile of daily maximum/minimum temperatures from observed historical data (32 climate model ensemble from Cal-Adapt, 2040–2059 average under RCP 8.5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Extreme Precipitation data are for the grid cell in which your project are located. The threshold of 20 mm is equivalent to about ¾ an inch of rain, which would be light to moderate rainfall if received over a full day or heavy rain if received over a period of 2 to 4 hours. Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.
Sea Level Rise data are for the grid cell in which your project are located. The projections are from Radke et al. (2017), as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider different increments of sea level rise coupled with extreme storm events. Users may select from four model simulations to view the range in potential inundation depth for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 50 meters (m) by 50 m, or about 164 feet (ft) by 164 ft.
Wildfire data are for the grid cell in which your project are located. The projections are from UC Davis, as reported in Cal-Adapt (2040–2059 average under RCP 8.5), and consider historical data of climate, vegetation, population density, and large (> 400 ha) fire history. Users may select from four model simulations to view the range in potential wildfire probabilities for the grid cell. The four simulations make different assumptions about expected rainfall and temperature are: Warmer/drier (HadGEM2-ES), Cooler/wetter (CNRM-CM5), Average conditions (CanESM2), Range of different rainfall and temperature possibilities (MIROC5). Each grid cell is 6 kilometers (km) by 6 km, or 3.7 miles (mi) by 3.7 mi.

6.2. Initial Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	0	0	N/A
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	0	0	N/A
Wildfire	1	0	0	N/A
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	0	0	0	N/A

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.

The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores do not include implementation of climate risk reduction measures.

6.3. Adjusted Climate Risk Scores

Climate Hazard	Exposure Score	Sensitivity Score	Adaptive Capacity Score	Vulnerability Score
Temperature and Extreme Heat	5	1	1	4
Extreme Precipitation	N/A	N/A	N/A	N/A
Sea Level Rise	1	1	1	2
Wildfire	1	1	1	2
Flooding	N/A	N/A	N/A	N/A
Drought	N/A	N/A	N/A	N/A
Snowpack Reduction	N/A	N/A	N/A	N/A
Air Quality Degradation	1	1	1	2

The sensitivity score reflects the extent to which a project would be adversely affected by exposure to a climate hazard. Exposure is rated on a scale of 1 to 5, with a score of 5 representing the greatest exposure.
The adaptive capacity of a project refers to its ability to manage and reduce vulnerabilities from projected climate hazards. Adaptive capacity is rated on a scale of 1 to 5, with a score of 5 representing the greatest ability to adapt.
The overall vulnerability scores are calculated based on the potential impacts and adaptive capacity assessments for each hazard. Scores include implementation of climate risk reduction measures.

6.4. Climate Risk Reduction Measures

7. Health and Equity Details

7.1. CalEnviroScreen 4.0 Scores

The maximum CalEnviroScreen score is 100. A high score (i.e., greater than 50) reflects a higher pollution burden compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Exposure Indicators	—
AQ-Ozone	98.7
AQ-PM	4.43
AQ-DPM	1.14

Drinking Water	70.5
Lead Risk Housing	65.1
Pesticides	4.55
Toxic Releases	18.1
Traffic	3.04
Effect Indicators	—
CleanUp Sites	0.00
Groundwater	0.00
Haz Waste Facilities/Generators	1.80
Impaired Water Bodies	90.1
Solid Waste	75.7
Sensitive Population	—
Asthma	26.6
Cardio-vascular	44.6
Low Birth Weights	67.2
Socioeconomic Factor Indicators	—
Education	9.73
Housing	12.8
Linguistic	0.26
Poverty	55.9
Unemployment	35.0

7.2. Healthy Places Index Scores

The maximum Health Places Index score is 100. A high score (i.e., greater than 50) reflects healthier community conditions compared to other census tracts in the state.

Indicator	Result for Project Census Tract
Economic	—
Above Poverty	53.62504812

Employed	15.8475555
Median HI	38.16245348
Education	—
Bachelor's or higher	57.65430515

Site History

The Facility was originally permitted by the Regional Water Board on June 28, 1973. The types of waste that have been accepted at the BBSL include residential, commercial, demolition/construction, and agricultural. The Discharger submitted a report of waste discharge (ROWD), dated March 12, 2013, to update the WDRs for the Facility to incorporate changes resulting from the final closure of the landfill and to comply with current laws and regulations, as set forth in the California Water Code and the California Code of Regulations, Title 27. The Discharger currently operates a refuse transfer station at the Facility. The discharge or deposit of any solid waste at this site is prohibited.

TECH MEMO

REPLENISH
Big Bear

Date:	10/1/2023
To:	Tom Dodson and Kaitlyn Dodson, TDA
Prepared by:	Michael A. Anderson, Antonia Estevez-Olea, PE - Water Systems Consulting, Inc. (WSC)
Reviewed By:	Laine Carlson, PE (WSC)
Project:	Replenish Big Bear Program
Subject:	Water Quality Analysis for the Sand Canyon Recharge Area

Introduction

As part of the Replenish Big Bear Program (Program), up to 380 acre-feet per year (AFY) of Program Water stored in Big Bear Lake will be used for groundwater recharge at the Sand Canyon Recharge Area over a six-month dry weather period. In addition, Program Water stored in Big Bear Lake could also be extracted to irrigate Bear Mountain Golf Course (up to 120 AFY) and for dust control of a bike park at the Snow Summit Ski Resort (up to 120 AFY). This technical memorandum evaluates whether these proposed uses of the blended Program Water stored in Big Bear Lake have the potential to cause violations of any water quality standards in Big Bear Valley Basin, violations of expected waste discharge requirements or otherwise degrade surface or groundwater quality.

Per the Santa Ana River Basin Plan (Basin Plan), the Big Bear Valley Basin has a total dissolved solids (TDS) objective of 300 mg/L, a hardness objective of 225 mg/L, a sodium objective of 20 mg/L, a chloride objective of 10 mg/L, a nitrate as N objective of 5 mg/L, and a sulfate objective of 20 mg/L. As shown in **Table 1**, Big Bear Lake has more stringent water quality objectives, so the proposed use of Program Water (which is purified water) is estimated to improve water quality in Big Bear Lake for TDS, total nitrogen (TN), and maintain similar water quality for total inorganic nitrogen (TIN) as discussed in the Antidegradation Analysis for Proposed Discharges to Stanfield Marsh/ Big Bear Lake and Shay Pond (WSC/LWA, 2022).

Table 1. Water Quality Objectives for Receiving Waters

Water Quality Objective (WQO)	Big Bear Lake	Big Bear Valley
Total Dissolved Solids (TDS), mg/L	175	300
Hardness, mg/L	125	225
Sodium, mg/L	20	20
Chloride, mg/L	10	10
Total Inorganic Nitrogen, mg/L	0.15	--
Nitrate as N	--	5
Sulfate, mg/L	10	20
Total Phosphorus, mg/L (TMDL Objective)	0.035	--
Chlorophyll-a, mg/L (TMDL Objective)	0.014	--

Per conversations with DDW, Big Bear Lake may be designated as a non-restricted recycled water impoundment, and the subsequent use of Program Water stored in Big Bear Lake water for snowmaking, landscape irrigation, dust control, and groundwater recharge via surface application would be subject to recycled water regulations. The non-potable recycled water uses for landscape irrigation, dust control, snowmaking, and nonrestricted impoundment are anticipated to be regulated under the Statewide Water Reclamation Requirements for Recycled Water Use (Oder WQ 2016-0068-DDW). This Order sets rules for recycled water users to avoid the overapplication of recycled water that would result in runoff or groundwater recharge. Therefore, it can be assumed that these proposed uses will not impact the water quality of the Big Bear Valley Basin.

To permit the Sand Canyon groundwater recharge project via surface application, the City of Big Bear Lake Department of Water (BBLDWP), the lead proponent for that portion of the Program, will need to submit a Report of Waste Discharge (ROWD) and technical studies to the Santa Ana Regional Water Quality Control Board to obtain a Waste Discharge Requirements (WDR) permit to implement the proposed uses in the Sand Canyon Recharge Area. As part of the WDR permit process, an antidegradation analysis will be prepared to evaluate the water quality impacts in more detail than this technical memorandum to demonstrate that the project is consistent with state antidegradation policy. An antidegradation analysis is robust and is used by regulators to set permit conditions. Another study that will be completed as part of the ROWD is a Title 22 Engineering Report. This report will describe how the permittee will comply with the regulations applicable to a surface application groundwater recharge project. Overall, the WDR permitting process ensures that the beneficial uses of Big Bear Valley Basin are protected by setting permit requirements to mitigate and/or avoid impacts. These studies will be completed once the design of the advanced water purification facility (AWPF) and Sand Canyon recharge facilities are more developed to provide the necessary information.

Predicted Concentrations of TDS and Selected Constituents in Sand Canyon Recharge

To evaluate the potential impacts that the Program Water stored in Big Bear Lake will have on Big Bear Valley Basin, the same CE-QUAL-W2 model used for Big Bear Lake Analysis (Anderson 2021) was used to simulate the water quality of the blended Program Water and Big Bear Lake at the extraction point. The extraction point is located near Rathbun Creek, and Program Water would be extracted using an existing pump station and pipeline used by the Bear Mountain and Snow Summit Resorts to extract lake water for snowmaking. The model simulated the extraction of Program Water stored in Big Bear Lake for groundwater recharge (380 AFY) and landscape irrigation (120 AFY). The extraction for dust control was not accounted for in the model since the model showed that Big Bear Lake extractions improved water quality (at least for TDS), so this scenario is more conservative as additional extraction would yield better water quality results. This simulation evaluated predicted conditions for a 41-year time period using available meteorological and hydrologic data for 2009-2019 and a probability-based forward forecast using the median hydrologic scenario with about 2,200 AFY of Program Water being discharged into Big Bear Lake. These assumptions are consistent with the assumptions used to evaluate the impacts on Big Bear Lake without the extractions.

The model explicitly calculated TDS and nitrate as N concentrations at the withdrawal segment in the model where Program Water would be extracted for groundwater recharge and landscape irrigation. The concentrations of sodium, chloride, sulfate, and hardness were not explicitly predicted by this model. While the Big Bear Lake Analysis model could be set up to simulate these additional chemical species by assigning them as generic constituents, there is a lack of necessary watershed runoff and Big Bear Lake concentration data upon which to develop such a model. As a result, sodium, chloride, sulfate, and hardness concentrations in Program Water extracted for recharge and landscape irrigation were estimated from model-predicted TDS concentrations based upon chemical data for Big Bear Lake water collected on December 12, 2021 and July 27, 2023 at TMDL Station #9[1] (**Table 2**) and chemical data collected from the effluent of an ongoing pilot treatment facility that is expected to be representative of the purified water ultimately discharged to Big Bear Lake (**Table 3**).

Table 2. MAJOR ION CHEMISTRY IN BIG BEAR LAKE AS MEASURED ON 12/12/2021 AND 7/27/2023 (TMDL STATION #9)

Date	TDS (mg/L)	Hardness [a] (mg/L)	Sodium (mg/L)	Chloride (mg/L)	Sulfate (mg/L)
12 Dec 2021	251	157	33	26	18
27 Jul 2023	230	140	23	21	12
Average	***241***	***149***	***28***	***24***	***15***

[1] Per the Big Bear Lake Nutrient Total Maximum Daily Load (Nutrient TMDL) for Dry Hydrologic Conditions (Resolution No. R8-2006-0023), the Stanfield Middle TMDL monitoring is located closest to the discharge and extraction points. Therefore, the water quality at this location was used. This location is at N 34° 15' 25.9" W 116° 53' 56.0".

[a] Hardness presented as mg/L $CaCO_3$

Table 3. MAJOR ION CHEMISTRY IN PROGRAM WATER BASED UPON PILOT PLANT EFFLUENT, TDS CONCENTRATION AS REPRESENTED IN BIG BEAR LAKE ANALYSIS MODELING AND ASSUMED RO EFFLUENT STABILIZATION USING 10 mg/L Calcium (Ca2+)

Date	TDS [a]	Hardness [b]	Sodium	Chloride	Sulfate
22 Jun 2023	50	25	3.7	2.3	<0.03
29 Jun 2023	50	25	3.8	2.3	<0.03
7 Jul 2023	50	25	NA	2.2	0.03
Average	***50***	***25***	***3.8***	***2.3***	***0.03***

[a] TDS as modeled; [b] hardness presented as mg/L $CaCO_3$. A TDS of 50 mg/L was used to be consistent with previous model runs. Based on pilot data, the TDS content is expected to be lower.

[b] Hardness presented as mg/L CaCO3.

Concentrations of sodium, chloride, sulfate, and hardness were estimated from the Big Bear Lake Analysis model predicted TDS values over time using a ratio approach in which the relative contributions of these ions to TDS were assumed to be fixed at values derived from **Table 2** and **Table 3.** The resulting ratios are shown in **Table 4**. For example, sodium at an average concentration of 28 mg/L under natural runoff conditions (i.e., no Program Water) represented 12% of TDS ($R_{Big\ Bear\ Lake}$=28/241=0.12) in Big Bear Lake and 8% ($R_{Effluent}$=3.8/50=0.08) in Program Water. A simple mixing model, in which natural runoff and Program Water represented about 75% and 25% of total runoff under average conditions, respectively, allows for calculation of approximate flow-weighted average concentration ratios (R) via an equation of the form:

$$R = R_{Big\ Bear\ Lake} * 0.75 + R_{Effluent} * 0.25$$

Concentrations (C) of sodium, chloride, sulfate and hardness in Program Water withdrawn from Big Bear Lake for recharge were then estimated from Big Bear Lake Analysis predicted TDS values at the withdrawal location simply as:

$$C = R * TDS$$

Table 4. CONCENTRATION RATIOS BASED UPON AVERAGE VALUES IN BIG BEAR LAKE AND PILOT PLANT EFFLUENT

Date	Hardness [a]	Sodium	Chloride	Sulfate
Big Bear Lake ($R_{Big\ Bear\ Lake}$)	0.65	0.12	0.10	0.06
Pilot Effluent ($R_{Effluent}$)	0.50	0.08	0.05	0.00
Weighted Average (R)	***0.59***	***0.11***	***0.08***	***0.05***

[a] Hardness presented as mg/L $CaCO_3$

The Big Bear Lake Analysis model previously simulated TDS and nitrate as N concentrations at the withdrawal location in Big Bear Lake supplemented with about 2,200 AFY Program Water (Anderson, 2022). The mean, median, minimum, and maximum concentrations from the model simulation are summarized in **Table 5**. The concentrations of TDS and nitrate as N in the Program Water withdrawn from Big Bear Lake for recharge and irrigation averaged 165.8±37.7 and 0.029±0.059 mg/L, respectively.

As noted previously, the lack of information about concentrations of sodium, chloride, sulfate, and hardness in runoff and Big Bear Lake precluded their direct modeling in recharge flows and necessitated projecting their concentrations. Thus, it was assumed that changes in TDS yield corresponding changes in the concentrations of these constituent ions at the flow-weighted average concentrations ratios provided in **Table 4**. While this represents an approximation, it is geochemically consistent with the conservative behavior of sodium and chloride in all natural waters except hypersaline brines. Sulfate is geochemically conservative up to the solubility limit for gypsum in most natural waters, but is subject to microbial reduction under strongly reducing conditions (which are not widely present in Big Bear Lake) as well as reoxidation. Like sulfate, hardness is not likely to be perfectly conservative, owing in this case to some potential for precipitation of calcium carbonate ($CaCO_3$), although redissolution from bottom sediments can also occur; nonetheless Magnesium(2+) would under most conditions would be conservative, so substantial deviations in the relative concentration of hardness with TDS seems unlikely.

Overall, water withdrawn from Big Bear Lake and used for recharge of Sand Canyon and landscape irrigation is predicted to have mean concentrations of 18.2, 13.3 and 8.3 mg/L for sodium, chloride, and sulfate, respectively, and a mean hardness value of about 97.8 mg/L $CaCO_3$ (**Table 5**). Maximum concentrations of these ions that would be present in recharge water under protracted drought were on the order of about 50% higher than mean values, although the use of average relative flows would be expected to skew somewhat predicted concentrations under both extreme runoff and drought conditions. The Program Team will work with the Santa Ana Regional Water Board during the development of the WDR permit for Sand Canyon Recharge Area to consider the possibility of using extended averaging periods (such as a 5-year or 10-year average) for compliance for some constituents, recognizing that variable local hydrology may result in short term changes in recharge water quality that may balance out over a longer period and still maintain compliance with water quality objectives. In addition, the recharge operation will be operated adaptively based on groundwater levels and water quality trends and can be paused if needed to ensure compliance with permitted water quality limits.

Table 5. MODEL-PREDICTED (TDS AND NITRATE AS N) AND PROJECTED (SODIUM, CHLORIDE, SULFATE, AND HARDNESS) CONCENTRATIONS (mg/L) IN RECHARGE AND IRRIGATION PROGRAM WATER WITHDRAWN FROM BIG BEAR LAKE UNDER THE MEDIAN HYDROLOGIC SCENARIO SUPPLEMENTED WITH ABOUT 2,200 AFY OF PROGRAM WATER

Parameter	TDS	Nitrate as N	Sodium	Chloride	Sulfate	Hardness [a]
Mean ± sd	165.8 ± 37.7	0.029 ± 0.059	18.2 ± 4.1	13.3 ± 3.0	8.3 ± 1.9	97.8 ± 22.2
Median	159.7	<0.001	17.6	12.8	8.0	94.2
Minimum	105.4	<0.001	11.6	8.4	5.3	62.2
Maximum	258.2	0.3	28.4	20.7	12.9	152.4

Assessment of Water Quality Impacts

Table 6 presents a water quality comparison of the Program Water stored in Big Bear Lake that would be used for groundwater recharge at Sand Canyon and/or irrigate the projected recharge and irrigation Bear Mountain Golf Course, the mean values from **Table 5**, Big Bear Basin water quality objectives, and the ambient water quality of Big Bear Valley Groundwater basin in the Sand Canyon Recharge Area. The ambient water quality of the Sand Canyon Recharge Area was estimated by averaging water quality data from five drinking water wells near the Sand Canyon Recharge Area. The groundwater quality data were collected in 2014, 2017, and 2021.

The projected Program Water stored in Big Bear Lake for subsequent Lake uses and the ambient water quality near the Sand Canyon Recharge Area were assessed to determine if the proposed future uses of Program Water stored in Big Bear Lake would result in concentrations that exceed existing ambient water quality and/or relevant WQOs or criteria. In order to determine whether the Sand Canyon Recharge Area Project would violate water quality standards, the model predicted mean concentrations for the Program Water stored in Big Bear Lake that would be used for groundwater recharge and/or irrigation were compared against the following:

- If the Project Water stored in Big Bear Lake is below the ambient and most stringent WQO or criterion, no degradation is anticipated.
- If the Program Water stored in Big Bear Lake is above the ambient water quality, but below the most stringent WQO or criterion, there is assimilative capacity available, which would indicate that the WQO would not be violated.
- If the Program Water stored in Big Bear Lake is above the most stringent WQO or criterion, but below the ambient water quality, there is a possibility of water quality improvements, which would provide benefit by improving conditions and help improve conditions to help attain the WQO.

- Finally, if the Program Water stored in Big Bear Lake is above ambient water quality and the most stringent WQO or criterion degradation is anticipated, a complete analysis may be required.

Table 6. COMPARISON OF MOST STRINGENT WATER QUALITY OBJECTIVE OR CRITERION TO THE SAND CANYON RECHARGE GENERAL AREA WATER QUALITY AND PROJECTED PROGRAM WATER IN RECHARGE AND IRRIGATION WITHDRAWN FROM BIG BEAR LAKE UNDER THE MEAN HYDROLOGIC SCENARIO SUPPLEMENTED WITH ABOUT 2,200 AFY

Parameter	TDS	Nitrate as N	Sodium	Chloride	Sulfate	Hardness
Big Bear Valley WQO	300	5	20	10	20	225
Big Bear Valley Average Concentration in Sand Canyon Recharge Area	324	4	17	15	35	277
Model Predicted Mean for Recharge/Irrigation Program Water ± sd	165.8 ± 37.7	0.029 ± 0.059	***18.2 ± 4.1***	***13.3 ± 3.0***	8.3 ± 1.9	97.8 ± 22.2

Note:
Blue – Projected Program Water stored in Big Bear Lake quality is below the ambient and most stringent WQO or criterion. No degradation is anticipated.
Black – Projected Program Water stored in Big Bear Lake quality is above the ambient, but below the most stringent WQO or criterion. Further analysis may be needed to determine impacts on water quality.

As shown in **Table 6,** the existing water quality of the Basin near the Sand Canyon recharge area exceeds the WQOs for TDS, chloride, sulfate, and hardness. The Program Water stored in Big Bear Lake is estimated to be of better quality than ambient and the most stringent WQO for TDS, nitrate as N, sulfate, and hardness, so no degradation is predicted since the Program Water is anticipated to improve water quality conditions and comply with WQOs. The sodium concentration in the Program Water stored in Big Bear Lake is estimated to be above the ambient water quality but below the WQO. Therefore, there is some limited assimilative capacity. The estimated chloride concentration in the Program Water stored in Big Bear Lake is estimated to be below the ambient water quality, but above the WQO. Therefore, the project has the potential to improve or maintain the existing water quality conditions of the basin near the Sand Canyon recharge area, even though the WQO for chloride is exceeded.

Per the Basin Plan, the presence of sodium in drinking water may be harmful to persons suffering from cardiac, renal, and circulatory diseases. As noted in the Basin Plan, the California Department of Health Services (now Division of Drinking Water) and the EPA have not established a limit on the concentration of sodium in drinking water, but recommend for sodium concentrations to not exceed 180 mg/L in groundwaters designated MUN (municipal use) as a result of controllable water quality factors. As shown in **Table 6**, the sodium concentration in the Program Water stored in Big Bear Lake is less than 20 mg/l, well below this threshold and therefore would not be harmful to the MUN use of this Basin. Excess concentrations of sodium in irrigation water reduce soil permeability to water and air. The Basin Plan,

groundwaters designated as AGR (agricultural) must not exceed a sodium absorption ratio (SAR[2]) of 9 as a result of controllable water quality factors. The groundwater basin is not designated as an AGR therefore, this threshold is not applicable, however, the water from the Basin is used to irrigate a golf course. For comparison purposes, the SAR for the Program Water stored in Big Bear Lake is 0.8, so using the Program Water for irrigation is not expected to be problematic.

Per the Basin Plan, excess chloride concentrations lead primarily to economic damage rather than public health hazards. Excess Chlorides can significantly affect the corrosion rate of steel and aluminum and can be toxic to plants. Per the Basin Plan, a safe value for irrigation is considered to be less than 175 mg/L of chloride. Excess chlorides affect the taste of potable water, so drinking water standards are generally based on potability rather than on health. The secondary maximum contaminant upper limit for chloride is 500 mg/L (CCR, Division 4, Chapter 15, Article 16, § 64449), so chloride concentrations should not exceed this limit in groundwaters designated as MUN. As shown in **Table 6**, the chloride concentrations in the Basin and the Program Water stored in Big Bear Lake are approximately 15 mg/l, far below the 500 mg/L and 175 mg/L thresholds discussed above, and therefore the Program Water stored in Big Bear Lake would not be harmful to the MUN use of the Basin and would be suitable for irrigation use.

Conclusions

The Program Water stored in Big Bear Lake is estimated to be of better quality than ambient and the most stringent WQO for TDS, nitrate as N, sulfate, and hardness and is therefore anticipated to improve water quality conditions in the Basin. Although the Program Water stored in Big Bear Lake is projected to have a higher concentration than the established chloride WQO objective, the discharge is necessary to provide important economic and social benefits, the discharge may help reduce current ambient chloride concentrations in the Basin, and the beneficial uses of the Basin would be protected.

As part of the WDR permit process, an antidegradation analysis will be prepared to evaluate the water quality impacts in more detail than this technical memorandum and demonstrate that the project is consistent with state antidegradation policy.

[2] Sodium absorption ratio (SAR) = $\frac{Sodium}{[0.5(calcium+magnesium)]\text{^}0.5}$, in Meq/L

Date: October 19, 2023

Re: Analysis of Aquatic Life Effects and Water Quality of Replenish Big Bear Program's Discharge to Stanfield Marsh and Big Bear Lake

Introduction

In 1982, Big Bear Municipal Water District (BBMWD) and the California Department of Fish and Wildlife (CDFW) dredged a basin on the eastern end of Big Bear Lake and created a culverted connection to the lake. The shoreline was planted, with the goal of creating a wildlife and waterfowl preserve. Stanfield Marsh is 145 acres and has supported a rich assemblage of birds, fish, amphibians, and mammals, some of which are rare. However, Stanfield Marsh has been mostly dry due to the prolonged drought.

As part of the Replenish Big Bear Program (Program), the Big Bear Area Regional Wastewater Agency (BBARWA) will discharge full advanced treated water (purified water) to the east end of Stanfield Marsh, which is hydrologically connected to Big Bear Lake through a set of culverts under the Stanfield Cutoff. The discharge to Shay Pond was not evaluated since this Program component will not be implemented in the near future.

GEI was retained by Tom Dodson and Associates to determine the projected effects of the discharge of purified water to aquatic life in Stanfield Marsh and Big Bear Lake. The memo evaluates the available water quality results and describes the data gaps that limit our understanding of how Program implementation will affect beneficial uses related to aquatic life and how these beneficial uses of Stanfield Marsh and Big Bear Lake will be protected through the implementation of the Program.

This memorandum summarizes and analyzes potential impacts to the water quality, aquatic life, and beneficial uses as a result of the Program's discharge to Stanfield Marsh and Big Bear Lake. The analysis uses modeled outputs specific to Big Bear Lake, and partial BBARWA advanced water purification facility pilot data for the Replenish Big Bear Pilot Study collected from June through September 2023, and the Antidegradation Analysis (WSC 2022) to anticipate potential impacts. The Memo also described the data gaps that limit our understanding of how the Stanfield Marsh/Big Bear Lake discharge will affect beneficial uses related to aquatic life and how these beneficial uses of Stanfield Marsh and Big Bear Lake will be protected through the implementation of the Program. Data gaps and sources of uncertainty are addressed as part of an adaptive management and monitoring plan.

Replenish Big Bear Program

BBARWA operates an existing regional wastewater treatment plant (WWTP) and related facilities in Big Bear Valley. BBARWA has partnered with Big Bear City Community Service District (BBCCSD), Big Bear Lake Department of Water and Power (BBLDWP), BBMWD, and Bear Valley Basin Groundwater Sustainability Agency (BVBGSA), collectively known as the Agency Team, to develop the Replenish Big Bear Program. The Replenish Big Bear Program is intended to help protect Big Bear Valley and the Santa Ana Watershed from the impacts of drought and variable precipitation by recovering a water resource currently discharged outside of the watershed. The Replenish Big Bear Program is comprised of three independent projects:

1) Discharge of the Program's purified water to Stanfield Marsh, which is a tributary to Big Bear Lake, and a separate discharge to Shay Pond, which will not be implemented in the near future;
2) Use Program water stored in Big Bear Lake for purposes such as landscape irrigation of the local golf course, dust control, and snowmaking; and
3) Use Program water stored in Big Bear Lake for groundwater recharge in Sand Canyon.

The discharge to Stanfield Marsh is the focus of this analysis. This discharge has been proposed to recover up to 2,200 acre-feet per year (AFY) of treated wastewater that is currently exported to Lucerne Valley. Treatment upgrades at the BBARWA WWTP would include tertiary filtration, nutrient removal, ultra filtration, reverse osmosis, and ultraviolet disinfection and advanced oxidation process for 100 percent of the effluent. The proposed location for discharge is the upstream end of Stanfield Marsh (WSC 2022). Impacts on Shay Pond were not evaluated since this discharge is not presently planned to be implemented in the near future.

Beneficial Uses of Stanfield Marsh and Big Bear Lake

Santa Ana River Basin Water Quality Control Plan

The Water Quality Control Plans contain descriptions of the legal, technical, and programmatic bases for water quality regulation. They describe the beneficial uses of major surface waters, their tributaries, and the corresponding water quality objectives (WQOs) put into effect to protect these beneficial uses. Water Quality Control Plans must be updated every three years in compliance with the Porter-Cologne Act. The Santa Ana Regional Water Quality Control Plan: Santa Ana River Basin Plan (Basin Plan) designates lakes and reservoirs and inland wetlands in the Program area along with their associated beneficial uses for each water body as summarized in **Table 1** (San Bernardino Mountain Hydrologic Area, Bear Valley Hydrologic Subarea, Hydrologic Unit #801.71). Designated beneficial uses for specific surface water and groundwater resources and the enforceable water quality objectives necessary to protect those beneficial uses are defined in the Basin Plan.

The Basin Plan includes numerical and narrative water quality objectives for microbiological, physical, and chemical water quality constituents. In the Santa Ana River Region, regional objectives are set for ocean waters, enclosed bays and estuaries, inland surface waters, and groundwaters. Since Stanfield Marsh and Big Bear Lake are identified as the discharge locations for the Program's purified water, regional objectives for lakes and reservoirs and inland wetlands as outlined in Chapter 4 of the Basin Plan are considered as there are several identified designated beneficial uses.

Table 1. Designated Beneficial Uses within Program Area.

Waterbody	Beneficial Uses									
	MUN	AGR	GWR	REC1	REC2	COMM	WARM	COLD	WILD	RARE
Lakes and Reservoirs – Upper Santa Ana River Basin[1]										
Big Bear Lake	X	X	X	X	X	X	X	X	X	X
Inland Wetlands[1]										
Stanfield Marsh[2]	X			X	X			X	X	X

[1] Basin Plan – Table 3-1
[2] This is a created wetland as defined in the wetland discussion of the Basin Plan
Source: Santa Ana River Basin Plan 2019

Beneficial uses as identified in **Table 1** are defined below. The focus of this memo will be evaluating the designated beneficial uses that may impact aquatic wildlife in Big Bear Lake and Stanfield Marsh, which are COMM, WARM, COLD, WILD, and RARE.

- **Municipal and Domestic Supply (MUN)** Uses of water for community, military, or individual water supply systems including, but not limited to, drinking water supply.
- **Agricultural Supply (AGR)** Uses of water for farming, horticulture, or ranching including, but not limited to, irrigation, stock watering, or support of vegetation for range grazing.
- **Groundwater Recharge (GWR)** Uses of water for natural or artificial recharge of groundwater for purposes of future extraction, maintenance of water quality, or halting of saltwater intrusion into freshwater aquifers.
- **Water Contact Recreation (REC-1)** Uses of water for recreational activities involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, white-water activities, fishing, or use of natural hot springs.
- **Non-Contact Water Recreation (REC-2)** Uses of water for recreational activities involving proximity to water, but not normally involving body contact with water, where ingestion of water is reasonably possible. These uses include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing, or aesthetic enjoyment in conjunction with the above activities.
- **Commercial and Sport Fishing (COMM)** Uses of water for commercial or recreational collection of fish and shellfish, or other organisms including, but not limited to, uses involving organisms intended for human consumption or bait purposes.
- **Warm Freshwater Habitat (WARM)** Uses of water that support warm water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
- **Cold Freshwater Habitat (COLD)** Uses of water that support cold water ecosystems including, but not limited to, preservation or enhancement of aquatic habitats, vegetation, fish, or wildlife, including invertebrates.
- **Wildlife Habitat (WILD**) Uses of water that support terrestrial ecosystems including, but not limited to, preservation and enhancement of terrestrial habitats, vegetation, wildlife (e.g., mammals, birds, reptiles, amphibians, invertebrates), or wildlife water and food sources.

- **Rare, Threatened, or Endangered Species (RARE)** Uses of water that support habitats necessary, at least in part, for the survival and successful maintenance of plant or animal species established under state or federal law as rare, threatened, or endangered.

Water Quality Objectives

Water quality objectives for all inland surface water, which includes streams, rivers, lakes, and wetlands within the region are discussed in Chapter 4 of the Basin Plan and summarized in **Table 2**. This would apply to the Program area, particularly where the Program's purified water will be discharged into Stanfield Marsh. Although Stanfield Marsh does not have numerical water quality objectives, the numerical water quality objectives for Big Bear Lake are applied to this discharge as the water quality objectives are more stringent, and Stanfield Marsh has been mostly dry since 2015.

Table 2. Basin Plan Water Quality Objectives for Inland Surface Waters.

Constituents	Basin Plan Water Quality Objective
Algae	Waste discharges shall not contribute to excessive algal growth in inland surface receiving waters.
Ammonia, Un-ionized	Un-ionized ammonia objectives for WARM and COLD designated waterbodies in the Region. Calculated numerical Un-ionized ammonia as N objectives as well as corresponding total ammonia nitrogen concentration for various pH and temperature conditions are shown in Tables 4-2 and 4-3 of the Basin Plan.
Boron	Controllable water quality factors shall not exceed 0.75 ppm.
Chemical Oxygen Demand	Waste discharges shall not result in increases in Chemical Oxygen Demand levels, which adversely affect beneficial uses.
Chloride	Water shall not exceed 10 ppm for Big Bear Lake as a result of controllable water quality factors.
Chlorine Residual	Wastewater discharged shall not exceed 0.1 ppm.
Color	Water shall be free of coloration that cause nuisance or adversely affect beneficial uses. The natural color of fish, shellfish, or other inland surface water resources used for human consumption shall not be impaired.
Dissolved Solids, Total	Controllable water quality factors shall not exceed 175 ppm for Big Bear Lake.
Floatables	Water shall not contain floating material, including solids, liquids, foam, and scum, in concentrations that cause nuisance or adversely affect beneficial uses.
Fluoride	Concentrations shall not exceed the annual average of maximum optimal fluoride ranging from 0.7 ppm to 1.2 ppm when daily air temperature is greater than 32.5 and below 12.0 °C respectively. See page 4-11 of Basin plan for more detail.
Hardness (as $CaCO_3$)	Water shall not exceed 125 ppm for Big Bear Lake as a result of controllable water quality factors. Hardness of receiving waters used for MUN shall not be increased as a result of waste dischargers to levels that adversely affect beneficial uses.
Methylene Blue-Activated Substances (MBAS)	Controllable water quality factors shall not exceed 0.05 ppm in designated MUN waters. Waste discharges shall not contain concentrations of surfactants resulting in foam in the course of flow or use of the receiving water.
Nitrate	Controllable water quality factors shall not exceed 10 ppm (as N) in designated MUN waters.
Total Inorganic Nitrogen	Controllable water quality factors shall not exceed 0.15 ppm for Big Bear Lake.
Oil and Grease	Waters shall not contain oils, greases, waxes, or other materials in concentrations that result in a visible film or coating on the surface of the water

Constituents	Basin Plan Water Quality Objective
	or on objects in the water that cause nuisance, or adversely affect beneficial uses.
Dissolved Oxygen	5.0 ppm minimum for WARM designated waters; 6 ppm for COLD designated waters. In addition, waste discharges shall not cause the median dissolved oxygen concentration to fall below 85 percent of saturation or the below 75 percent of saturation within a 30-day period.
Pathogen Indicator Bacteria	< 126 E. coli organisms/100 mL for REC1 and REC2 designated waters.
pH	Controllable water quality factors shall not be raised above 8.5 or depressed below 6.5.
Radioactivity	Shall not be present in concentrations which are deleterious to human, plant, or animal life. MUN designated waters shall meet Title 22 drinking water standards.
Sodium	Controllable water quality factors shall not exceed 20 ppm for Big Bear Lake.
Solids, Suspended and Settleable	Shall not contain suspended or settleable solids in amounts which cause a nuisance or adversely affect beneficial uses.
Sulfate	Controllable water quality factors shall not exceed 10 ppm for Big Bear Lake.
Sulfide	Shall not be increased as a result of controllable water quality factors.
Tastes and Odors	Waters shall not contain taste or odor producing substances in concentrations that impart undesirable tastes or odor to fish flesh or other edible products of aquatic origin, that cause nuisance, or adversely affect beneficial uses.
Temperature	Temperature of COLD designated waters shall not increase by more than 5°F. Temperature of WARM designated waters shall not be raised above 90°F June through October or above 78°F during the rest of the year. Lake temperatures shall not be raised more than 4°F above established normal values as a results of controllable water quality factors.
Toxic Substances	Shall not be discharged at levels that will bioaccumulate in aquatic resources to levels which are harmful to human health. Concentrations of contaminants in existing or potential sources of drinking water shall not occur at levels that are harmful to human health. Concentrations of toxic pollutants in the water column, sediments or biota shall not adversely affect beneficial uses.
Turbidity	Waters shall be free of changes in turbidity that cause nuisance or adversely affect beneficial uses. Increases from normal background light penetration or turbidity relatable to waste discharge shall not be greater than 10 percent in areas where natural turbidity is greater than 100 NTU or greater than 20 percent in areas where natural turbidity is 0 – 50 NTU.

Note: ppm = parts per million; NTU = nephelometric turbidity units

Receiving Water Quality Evaluation

To understand potential water quality impacts to the receiving water bodies, Stanfield Marsh and Big Bear Lake, a treatment pilot study was conducted. The Program's pilot study goals are to: (1) demonstrate process performance for site-specific wastewater conditions to regulatory agencies, (2) confirm the proposed treatment process as a viable design approach to meet the target treatment levels, and (3) quantify the total system recovery for product water. During the pilot study, one set of samples was collected on July 20, 2023, from the effluent of the full advanced treatment pilot system (i.e., purified water) to evaluate the following constituents:

- The Santa Ana River Basin Plan (Basin Plan) Water Quality Objectives (WQOs) for Big Bear Lake;
- Priority pollutants from the California Toxic Rule (CTR) per Title 40 of Code of Federal Regulations (40 CFR) Part 131.38;
- The Maximum Contaminant Levels (MCLs) for Inorganic and Organic Chemicals as identified in Table 64431-A and Table 64444-A of the California Code of Regulation (CCR), Title 22, Chapter 15;
- Radionuclide chemicals in Tables 64442 and 64443 of the CCR, Title 22, Chapter 15;
- Disinfection byproducts in Table 64533-A of the CCR, Title 22, Chapter 15.5;
- Division of Drinking Water chemicals with notification levels (NLs);
- Lead and copper;
- Big Bear Lake Nutrient TMDL for Dry Hydrological Conditions;
- State Water Board's Water Quality Goals Online Database; and
- Regional Board and DDW specified chemicals.

In addition, BBARWA collected weekly samples after the wastewater received RO and UVAOP treatment from June through September 2023. The treated effluent results from the RO unit are shown in **Appendix A** and the results from the UVAOP unit in **Appendix B**. **Table 3** provides a summary of detected constituents from both the RO and UVAOP effluents. Both effluents are evaluated against the most stringent water quality standards used to protect the most sensitive designated beneficial uses for Big Bear Lake. As mentioned earlier, since Stanfield Marsh does not have numeric WQOs and has been predominately dry since 2015, the WQOs for Big Bear Lake are utilized. Available water quality data from Big Bear Lake are also included in **Table 3** to represent baseline conditions.

Three constituents exceed Big Bear Lake ambient levels or the most stringent WQO. Although boron does not exceed the most stringent WQO, the pilot study result is above Big Bear Lake ambient boron levels. This is based on a single result; therefore, boron is further discussed in the Data Gaps and Limitations Section. In addition, it is anticipated that boron will consume less than 10% of the assimilative capacity, as discussed in the Draft Environmental Impact Report. Similar to boron, ammonia pilot study results meet the most stringent WQO, however results are above ambient receiving water quality. For total inorganic nitrogen (TIN), the pilot study results exceed the ambient Big Bear Lake levels and the most stringent WQO. As a result of the pilot study results, treatment process optimization for ammonia and TIN are being explored to meet the ambient receiving water quality and the most stringent WQOs. Further discussion on ammonia and TIN is in the Nutrients Section.

[1] Results from AWPF-UVAOP-EFF (i.e., purified water without stabilization) sampling location sampled July 20, 2023 and weekly AWPF-UVAOP-EFF weekly samples. Average of results reported if multiple samples were collected. Results may change as the Pilot Study is finalized.

[2] Results were extracted from Table 7 of the Antidegradation Analysis (WSC 2022). Data is based on a simple sample taken on December 2, 2021, by BBMWD. For constituents monitored by the Nutrient TMDL, averages and for the Lake-wide results and were calculated using Nutrient TMDL 2009-2019 data.

[3] Sample collected from the AWPF-RO-EFF (i.e., Program water after RO treatment but before disinfection). Results may change as the Pilot Study is finalized

[4] Other nutrient treatment options to attain a higher removal efficiency are being explored to meet the most stringent TIN WQO of 0.15 ppm.

[5] The results of the pilot study are not provided since the concentrations will change after the purified water is stabilized. The purified water will be stabilized to prevent geochemical reactions such as mineral dissolution, oxidation, or desorption in Stanfield Marsh.

[6] TDS average was obtained from the Lake Analysis Table 19 baseline scenario and nutrients and chlorophyll-a averages from the Lake Analysis Table 22 baseline scenario (Anderson 2021).

[7] Part of the sum for five haloacetic acids, which has a drinking water MCL of 60 ppb.

[8] BBMWD collected an additional sample on July 27, 2023 at TMDL Station #9. Therefore, the results from this event and the sample collect in December 2021 were averaged.

Algae

It is possible that the rewetting of Stanfield Marsh will result in an increase in biologically available phosphorus (Surridge et al. 2012), which would increase algal growth in Stanfield Marsh, and in Big Bear Lake, if Stanfield Marsh spilled to the lake during rewetting. The increase in phosphorus depends on interstitial pore size, total organic carbon in soils (Gale et al. 1994), presence of aquatic vegetation, and the extent of the varial zone (Song et al. 2007). A small varial zone may help reduce the amount of phosphorus that is re-released into the aquatic environment. Other factors can include the seasonal timing of rewetting and the amount of uptake and storage by rooted and floating macrophytes – management strategies such as planting of rooted macrophytes can be employed during rewetting, to reduce the amount of phosphorus that remains in Stanfield Marsh and moved into the Big Bear Lake (e.g., Steffenhagen et al. 2012). Limiting the available nutrients in the water column would reduce the probability of nuisance algae blooms. Physical conditions in the rewetted Stanfield Marsh and projected levels of phosphorus in the Replenish Big Bear purified water should not contribute to increased levels of cyanobacteria. The rewetted Stanfield Marsh will be shallow and well-mixed (Anderson, personal communication 08/2023). Cyanobacteria benefit from stratified conditions because of their natural buoyancy but do not thrive in well-mixed water columns.

Temperature

The COLD beneficial use is discussed here because it is more stringent than the WARM beneficial use. Because Stanfield Marsh was mostly dry from 2015 through 2022, temperature modeling was required to estimate Program effects (Anderson 2022a). Dr. Anderson used his Big Bear Lake model to run a five-year simulation period, with minimum effluent temperatures of 12°C, a maximum temperature of 22°C, and a scenario of approximately 2,200 AFY of discharge.

Under the modeling scenario, water temperature excursions over 5°F/2.8°C in Stanfield Marsh only occurred during discrete periods when water levels were exceptionally low (≤ 1 meter). However, because of the frequency at which low water would occur, the number of excursions would be substantial. Results from Anderson 2022a highlighted some important general findings. Stanfield Marsh and Big Bear Lake are hydrologically connected through a set of culverts. For water flows to move from Stanfield Marsh into Big Bear Lake, Stanfield Marsh must first be filled before it starts flowing into the Big Bear Lake. Warm Program purified water discharged to the easternmost section

of Stanfield Marsh will quickly lose heat through exchange with the atmosphere and will be diluted with existing water. Higher lake levels afford greater opportunity for heat loss and dilution such that temperature effects are more likely at low lake levels. As a result of the modeling, the addition of warm purified water to Stanfield Marsh does not alter the heat budget for Big Bear Lake and is not predicted to alter lake temperature, duration, or intensity of thermal stratification. Program-specific information about inflow temperatures is needed to conduct a more complete analysis.

Nutrients

Nutrient constituents are typically TIN, total nitrogen (TN), total phosphorus (TP), and chlorophyll-a. **Table 3** indicates the Program water concentrations for these nutrient constituents generally meet the most stringent WQOs to protect the designated beneficial uses of Stanfield Marsh and Big Bear Lake, except for TIN. In addition, the Antidegradation Analysis (WSC 2022) prepared for the Program, predicted long-term average concentrations of TIN, TN, TP, and chlorophyll-a, which were lower with the proposed Program water discharge at various rates as compared to the predicted baseline condition, except for TIN under the 2,210 AFY + TP Offset. It is unclear why the model predicted increased TIN under this scenario while all other scenarios showed significantly reduced TIN values relative to the modeled baseline; however, the modeled difference in TIN between the Baseline and 2,210 AFY + TP Offset scenarios is approximately 4 percent, which is within the range of model variance and is considered statistically insignificant. Although modeling shows the projected long-term average concentration of TIN is similar to the modeled baseline condition, the pilot study results indicated the average TIN exceeded the Basin Plan WQO. Treatment process optimization is being explored to attain a higher removal efficiency to meet the most stringent TIN WQO of 0.15 ppm, which will also help reduce ammonia concentrations. For the purposes of this analysis, it is assumed that treatment optimization will result in attainment of 0.15 ppm TIN. If additional treatment equipment is needed to meet this objective, or if regulatory mechanisms are pursued to allow discharge above the TIN WQO, consistency with the Replenish Big Bear Program CEQA documentation will be verified, and, if determined necessary to comply with CEQA, subsequent CEQA documentation will be conducted.

Data Gaps and Limitations

Although modeling and a pilot study has been conducted for this Program, there are still some data gaps to better understand the potential impacts to the designated beneficial uses for Stanfield Marsh and Big Bear Lake with respect to aquatic wildlife and plants. These data gaps would be best resolved when Program water is discharged to Stanfield Marsh. Constituents of interest with data gaps are boron, dissolved oxygen, pH, and temperature. These constituents are further explained below.

Boron

Boron is a naturally occurring element, and boron deposits are found in desert areas in California (State Water Board 2017). Anthropogenic sources of boron include industrial wastewater discharges, municipal wastewater discharges, and agricultural practices. As referenced in Schoderboeck et al. (2011), boron does not biodegrade in surface water or sediments in freshwater environments.

California's searchable database for water quality goals also lists an agricultural goal of 0.7 ppm based on tolerance of various crops to boron reported in Ayers and Westcott (1985); this concentration of 0.7 ppm is well above the effluent concentration of 0.12 ppm. Boron toxicity can affect most crops, but there is a wide range of tolerance (Ayers and Westcott 1985); the most sensitive crops are affected

by boron concentrations approaching 0.5 ppm. Schoderboeck et al. (2011) also assessed toxicity data for aquatic environments through two approaches and review of extensive data; these two approaches resulted in predicted no effect concentrations in aquatic environments of 0.18 and 0.34 ppm. Boron is accumulated by rooted aquatic plants and algae; the extent to which this occurs is species-specific. Boron does not biomagnify or bioconcentrate in the food web or become concentrated in fish or invertebrates (CMME 2009).

While boron concentrations in the purified water are below receiving water limits as identified in the Basin Plan, only one pilot study boron result was available, and it exceeds the Big Bear Lake ambient boron levels. In addition, there is uncertainty as to how boron would be assimilated into Stanfield Marsh because there is no data that can be collected until the discharge is initiated. However, it appears that uptake by plants can be a significant source of sequestration of boron, suggesting that management of rooted macrophytes may provide a method of removing excess boron from Stanfield Marsh. To determine potential impacts on aquatic wildlife and plants in Stanfield Marsh and Big Bear Lake, it is recommended to conduct boron monitoring once Program water is discharged to Stanfield Marsh. Quarterly monitoring is recommended of the Program water effluent to observe the boron concentration prior to introduction into Stanfield Marsh and at the existing TMDL Sampling Station MWDL9. This location is already an established sampling station through the Big Bear Lake Nutrient TMDL and is representative of Stanfield Middle. If observed boron levels do not meet the Basin Plan WQO, mitigative actions may include but not be limited to the introduction of native plants to absorb boron in Stanfield Marsh.

Dissolved oxygen

Data is not currently available to predict dissolved oxygen levels in Stanfield Marsh, Big Bear Lake, or purified water. However, low dissolved oxygen levels could be ameliorated through aeration of effluent. Stanfield Marsh is shallow enough that stratification is unlikely to occur (Anderson, personal communication). In other words, the water column in Stanfield Marsh would be mixed through water movement and via wind mixing, which would facilitate roughly equal concentrations of dissolved oxygen throughout the water column. Also, it is possible to speculate on dissolved oxygen levels in the purified water, but there is considerable uncertainty surrounding what will happen when this purified water enters Stanfield Marsh. Low-nutrient water entering the marsh may also suppress dissolved oxygen levels by reducing algae and macrophyte production of dissolved oxygen (Anderson, personal communication). To determine potential impacts to aquatic wildlife, once purified water is discharged into Stanfield Marsh, dissolved oxygen should be monitored during and after re-wetting of Stanfield Marsh at the Program water effluent, in Stanfield Marsh (if permitted), and at existing TMDL Sampling Station MWDL9. If observed dissolved oxygen levels do not meet the Basin Plan WQO designated beneficial uses for COLD and WARM, mitigative actions may include but not be limited to the introduction of mechanical intervention to stabilize dissolved oxygen levels.

pH

The Basin Plan pH of inland surface waters water quality objective cannot have pH levels depressed below 6.5; pH values below this level also tend to be associated with lower fish and macrophyte productivity (Avault 1996). The volume of water entering Stanfield Marsh is significant (up to 2.2 MGD, or 3.4 cfs), so the entire volume of the marsh will likely turn over multiple times in a year. Pilot study results were non-detect due to the purified water not being stabilized yet. Based on modeling efforts, the Program’s water hardness is estimated to be around 25 ppm after stabilization.

The low alkalinity and hardness values of the effluent suggest a low buffering capacity and susceptibility to a change in pH upon entering Stanfield Marsh. The buffering capacity of Stanfield Marsh itself is currently unknown because it has been mostly dry since 2015, but soil chemistry has a large effect on the pH of small bodies of water. Despite minor potential pH concerns in Stanfield Marsh, the low hardness of the effluent suggests that it would likely have a negligible effect on the pH of Big Bear Lake, given its large relative volume to the purified water and its higher hardness of 157 ppm.

Since the treatment process maintains a neutral pH between 7 and 8 upstream of the reverse osmosis process, and then become slightly acidic downstream of reverse osmosis, post-treatment chemical addition will be employed to adjust the pH to a neutral level such that the effluent is within the Basin Plan water quality numerical objectives for pH. To determine potential impacts to aquatic wildlife, once purified water is discharged into Stanfield Marsh, pH should be monitored during and after re-wetting of Stanfield Marsh at the Program water effluent and at existing TMDL Sampling Station MWDL9. If observed pH levels do not meet the Basin Plan WQO for inland surface waters, mitigative actions may include but not be limited to introduction of a chemical intervention to stabilize pH levels.

Temperature

Temperature modeling data show that excursions of the COLD standard occurred 44 percent of the time, during low water, when Stanfield Marsh might otherwise be dry. While it is suspected that maintenance of flows and the presence of water are preferable in dry years, even if the COLD standards are not met, this could be confirmed with an adaptive management plan. Additional uncertainty about predicted temperatures arise because no temperature data are available for the Program's purified water - theoretical temperature ranges were developed using data from a pilot Program near sea level and corrected for elevation. As indicated in earlier discussions on the temperature modeling data, additional monitoring is recommended once the Program's purified water is discharged into Stanfield Marsh. Temperature modeling is recommended to be conducted using an online analyzer to obtain continuous readings of the Program water effluent and in Stanfield Marsh. Similar to previous discussions on location of monitoring, the existing TMDL Sampling Station MWDL9 can be utilized. If observed temperature levels do not meet the Basin Plan WQO designated beneficial uses for COLD and WARM, mitigative actions may include but not be limited to introduction of a temperature cooling mechanism to lower the temperature of the Program water before it is introduced into Stanfield Marsh.

Reinvasion by Undesirable Species

Invasive plants and aquatic animals (vertebrate or otherwise) will be able to access Stanfield Marsh when it is rewetted. Because it is upstream of Big Bear Lake, it may be desirable to prevent contamination of the marsh by species such as Eurasian Watermilfoil (*Myriophyllum spicatum*) and Common Carp (*Cyprinus carpio*). Proliferation of Eurasian Watermilfoil can cause periodic depression in dissolved oxygen levels, and this species adversely affects all beneficial uses relating to the protection of aquatic life. It is recommended for monitoring to be conducted at least on a bi-yearly basis to observe the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake.

Programed Beneficial Impacts

Big Bear Lake is an important resource that provides extensive recreational, economic, ecological, and aesthetic benefits for the local community as well as the larger inland southern California region. The beneficial uses of Big Bear Lake and Stanfield Marsh are presented in **Table 1.**

Precipitation and snowmelt runoff are the only water sources for Stanfield Marsh and Big Bear Lake, which causes variable water levels on a seasonal and annual basis. When water levels are low, local populations of flora and fauna decrease dramatically through mortality, emigration from the site, or both. Stanfield Marsh has been mostly dry since 2015. Due to the recent rains in 2023, Stanfield Marsh is currently wet.

Beneficial Uses for Rare and Common Wildlife Species

Stanfield Marsh occupies the eastern edge of Big Bear Lake. Because much of the existing marshland in the Big Bear Valley was inundated after the construction of Bear Creek Dam, Stanfield Marsh is critical to replacing wetland habitat that was lost in the late 1800s. However, water levels in the marsh fluctuate widely in response to available snowmelt and precipitation. Although BBMWD and the Natural Heritage Foundation have put significant effort into enhancing 148 acres of wetland vegetation, low water levels have prevented the successful establishment of a lakeshore fringe habitat and/or a wetland plant and animal community (BBL 1999).

The Program's effluent would help support the RARE and WILD beneficial uses simply by re-wetting the area. **Figure 1** shows Big Bear Lake area was at a record low in 2018 and Stanfield Marsh was dry. Extensive modeling by Anderson (2022a) showed that the release of water into Big Bear Lake through Stanfield Marsh would result in large increases in lake water surface elevation and lake water surface area. **Figure 2** shows this increase in inundated area would extend into Stanfield Marsh. Even under a scenario of protracted drought, defined as the fifth percentile of flows entering Stanfield Marsh and Big Bear Lake, at least some water would remain in Stanfield Marsh. This is in stark contrast to existing conditions, wherein the Stanfield Marsh has been mostly dry for several years. Some potential benefits are outlined below.

- Availability of water will allow the establishment of riparian plants, macrophytes, and algae, as well as the invertebrate and vertebrate fauna that rely upon them.
- Some organisms have the ability to adapt to extremely variable environments. For example, highly mobile animals (e.g., waterfowl) will avoid or emigrate from dry areas, and drought-tolerant plants can survive in a wide variety of moisture regimes or can remain dormant for long periods of time. However, less mobile/more specialized species are excluded from highly unpredictable environments. Reducing the degree of disturbance (i.e., episodic drying) will allow more species to utilize the area.
- Maintaining water levels in Stanfield Marsh may also increase lakeshore fringe habitat, which is currently limited due to water level fluctuations. This habitat type is utilized by rare birds (American Bald Eagle *Haliaeetus leucocephalus*, Southwestern Willow Flycatcher *Empidonax trailii extimus*), rare mammals (San Bernardino Flying Squirrel *Glaucomys sarinus*), and rare plants (Slender-petaled Thelypodium *Thelypodium stenopetalum*). Other more common species would benefit from the presence of lakeshore fringe and open water habitat as well. These include amphibians, ducks/wading birds, and bats that forage over open water (BBL 1999).

Returning a reliable source of water to Stanfield Marsh would unequivocally benefit wildlife, particularly aquatic or semi-aquatic species. However, the water quality in Stanfield Marsh is unknown, because while it is simple to characterize purified water, it may change substantially once Stanfield Marsh is rewetted and biological processes become established.

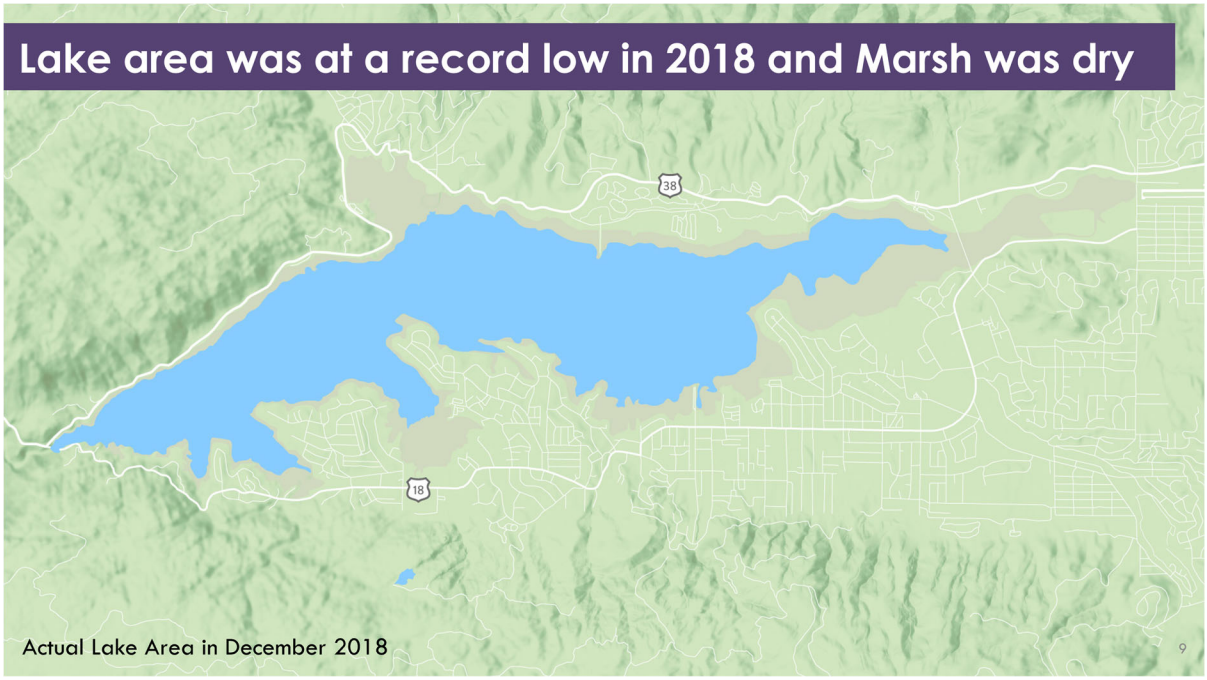

Figure 1. Big Bear Lake Area in December 2018.

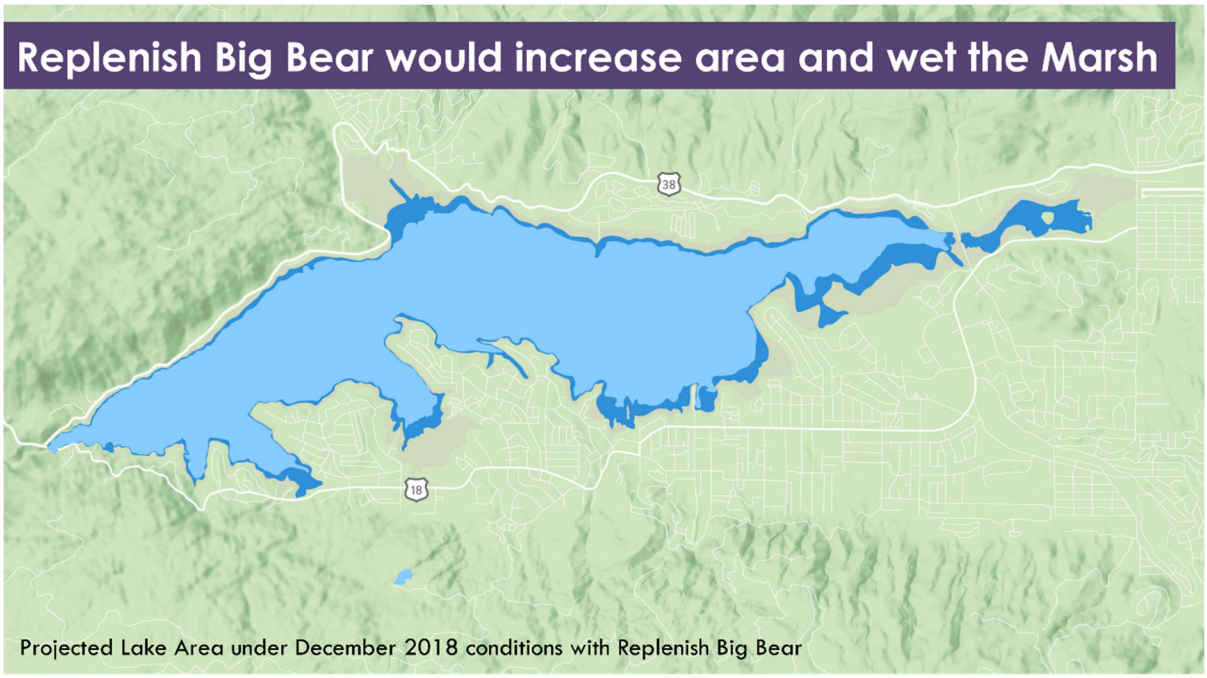

Figure 2. Projections under December 2018 Conditions with Replenish Big Bear Program.

The Lake Analysis (Anderson 2021) simulations for the 2009-2019 evaluation period demonstrated that the Replenish Big Bear Program Lake discharge would result in significant increases in predicted lake levels, volumes, and surface areas relative to baseline conditions. Long-term (2009 to 2050) simulations of the proposed Program water discharge under three different hydrologic scenarios indicate that the discharge would be especially beneficial under an "extended drought" scenario where the discharge is predicted to increase the median lake level by more than 10 feet and the median lake area by nearly 600 acres, which in turn would improve recreational access and provide additional Big Bear Lake habitat as compared to modeled baseline (no Program) conditions. The increased lake level and area benefits provided by the Program water discharge would be more modest under the "prolonged above average rainfall" scenario because higher natural inflows would result in higher lake levels. Error! Reference source not found. summarizes the projected impacts on Big Bear Lake level, area, and volume under three hydrologic conditions modeled in the 2021 Lake Analysis (Anderson 2021).

Table 4. Hydrologic Summary of Projected Impacts on Big Bear Lake.

Lake Physical Parameter (median values shown)	Scenario	Hydrologic Scenario		
		Extended Drought (5th Percentile)	Median Hydrologic Condition (50th Percentile)	Prolonged Above Average Rainfall (95th Percentile)
Lake Level (ft) (Lake max 6,743 ft)	Baseline	6,722	6,733	6,736
	+Program	6,732 (+10.5)	6,738 (+7.2)	6,740 (+5.2)
Volume (AF)	Baseline	23,400	47,536	54,724
	+Program	45,750 (+22,340)	59,664 (+12,128)	65,204 (+10,480)
Area (acres)	Baseline	1,720	2,328	2,474
	+Program	2,290 (+572)	2,568 (+240)	2,669 (+195)

Notes: Data taken from Table 24 of Lake Analysis report. Assumed a discharge rate of 1,920 AFY. Additional benefit is expected with a higher discharge rate.

Nutrients

As discussed in the Antidegradation Analysis (WSC 2022), TDS, TIN, TN, TP, and chlorophyll-a were evaluated using a two-dimensional (2D) hydrodynamic-water quality model (CE-QUAL-W2) developed for Big Bear Lake by Dr. Michael A. Anderson (Dr. Anderson), a limnologist who has in-depth knowledge of the lake. The model was used to predict the long-term average water quality of these constituents in Big Bear Lake under the average hydrologic conditions (50th percentile) and under increased and time-varying flows. The model simulation also assessed the impact of a TP offset program, which is being proposed to treat all the TP loads that will be added as a result of the discharge. For comparison, the model also simulated a no Program alternative to the predicted baseline condition. The predicted concentrations are presented in **Table 5**. Please note that this model run did not account for Program water extractions, which are discussed because extractions were predicted to improve the water quality of the Lake. Therefore, this analysis concludes that the projected long-term average concentration of TIN is similar to the modeled baseline condition.

Table 5. Predicted Long-term Average Lake Concentrations for TDS, TIN, TN, TP, and Chlorophyll-a Under Different Operational Scenarios

Operational Scenario (a) (All at 50th percentile hydrologic condition)	TDS (b) (mg/L)	TIN (b) (mg/L)	TP (b) (µg/L)	TN (b) (mg/L)	Chlorophyll-a (c) (µg/L)
WQO (TMDL target)	**175**	**0.15**	**0.15 (35.0)**	**n/a**	**(14.0)**
Baseline (No Program)	195	0.069	47.7	1.15	14.1
2,200 AFY (99% recovery)	179	0.045	42.3	1.04	13.1
2,000 AFY (90% recovery)	180	0.041	43.4	1.06	12.9
2,200 AFY + TP Offset	179	0.072	39.9	1.00	10.2
2,000 AFY + TP Offset	180	0.040	40.9	1.00	9.5

Notes:

a) The Baseline was evaluated in the 2021 Lake Analysis. The other operational scenarios were evaluated in the 2022 Lake Analysis Update and assume no discharge to Shay Pond. The TP Offset scenarios assume a TP Offset Program is implemented.

b) Expressed as annual average concentrations.

c) Chlorophyll-a shown as growing season average concentrations.

Conclusion

The Program's purified water effluent water quality was evaluated to assess the potential impacts to the water quality, aquatic life, and designated beneficial uses for Stanfield Marsh and Big Bear Lake. Available water quality from the Program's modeling study, BBARWA advanced water purification facility pilot data for the Replenish Big Bear Pilot Study, and antidegradation analyses conducted for this Program were utilized. Although multiple designated beneficial uses have been identified in the Basin Plan for Stanfield Marsh and Big Bear Lake, the designated beneficial uses applicable to aquatic life (COMM, WARM, COLD, WILD, and RARE) were evaluated here as the other beneficial uses have been previously evaluated in other studies.

Available water quality data were compared against the most stringent WQOs applicable to this Program. Based on the pilot study results, all constituents of concern related to this Program are within Big Bear Lake ambient water quality and meet the identified WQOs in Table 3 except for boron, ammonia, and TIN. Conducted modeling studies did not identify TIN as an exceedance but did note the Program needing to implement a TP Offset Program for the Program discharge to attain net zero TP loads to Big Bear Lake to be consistent with the assumptions of the Big Bear Lake Nutrient TMDL for Dry Hydrologic Conditions.

Data gaps were identified for boron, dissolved oxygen, pH, and temperature. To close the data gap, monitoring is recommended once the Program's discharge is introduced to Stanfield Marsh/Big Bear Lake. The Program's discharge effluent would be monitored along with utilizing the existing Nutrient TMDL Sampling Station MWDL9. In addition to the identified water quality constituents, at a minimum bi-yearly monitoring is recommended to observe the presence of invasive plants and aquatic animals within Stanfield Marsh and Big Bear Lake.

This Program is anticipated to provide beneficial impacts to the region. In addition to providing a sustainable water supply to the area and increasing lake levels, rewetting of Stanfield Marsh will be critical to replacing the wetland habitat that was lost in the late 1800s with the construction of the Bear Creek Dam. Thus, the Program would help support the WILD and RARE designated beneficial uses for Stanfield Marsh and Big Bear Lake. The introduction of a TP Offset Program will assist with meeting the Big Bear Lake Nutrient TMDLs.

Bear Valley Water Sustainability Study

• December 2016•

WSC
WATER SYSTEMS CONSULTING, INC.

Recycled Water Facilities Planning Study

for the

Bear Valley Water Sustainability Project

Prepared for

Big Bear Area Regional Wastewater Agency

Big Bear City Community Services District

Big Bear Lake Department of Water and Power

Big Bear Municipal Water District

Prepared Under the Responsible Charge of:

Laine Carlson

12/21/2016

WSC

WATER SYSTEMS CONSULTING, INC.

ACKNOWLEDGEMENTS

The project team for this Recycled Water Facilities Planning Study (Study) for the Bear Valley Water Sustainability Project would like to acknowledge the valuable input and guidance received from the Board of Directors of the Big Bear Area Regional Wastewater Agency:

- David Caretto, Chairman representing the City of Big Bear Lake
- John Green, Vice Chairman representing Big Bear Area Community Services District
- Elizabeth Harris, Secretary representing San Bernardino County Service Area 53B
- Richard Herrick, Jr., Director representing City of Big Bear Lake
- Paul Terry, Director representing Big Bear Area Community Services District

The Study was funded in part by a Water Recycling Facilities Planning Grant from the California State Water Resources Control Board Water Recycling Funding Program.

The Study for the Bear Valley Water Sustainability Project was prepared by Water Systems Consulting, Inc. The primary authors are:

- Laine Carlson, P.E.
- Joshua Reynolds, M.S., P.E.
- Kaylie Ashton, E.I.T.
- Matt Rodrigues, M.S., P.E.
- Emily Iskin, M.S., E.I.T.

Water Systems Consulting, Inc. would like to acknowledge the significant contributions of the Project Team.

EXECUTIVE SUMMARY

INTRODUCTION

Local groundwater provides the sole drinking water supply for the Big Bear Valley (Valley), located in the San Bernardino Mountains of San Bernardino County, California. Drought conditions and a long-term decline in precipitation trends have led local water and wastewater management agencies to investigate opportunities for supplemental supplies, which are extremely limited due to the high elevation and isolated location of the Valley. Currently, wastewater generated within the Valley is treated to secondary standards and discharged outside of the watershed to irrigate crops in the Lucerne Valley.

This Recycled Water Facilities Planning Study (Study) evaluates alternatives to develop a Bear Valley Water Sustainability Project with the goal to retain highly treated wastewater within the Valley for beneficial use. The Project Team for this Study is comprised of the Big Bear Area Regional Wastewater Agency (BBARWA), Big Bear City Community Services District (BBCCSD), Big Bear Lake Department of Water and Power (BBLDWP), and Big Bear Municipal Water District (BBMWD). The Project Team recognizes that retaining recycled water in the watershed for beneficial use would significantly increase the sustainability of local water supplies and has partnered to jointly fund and prepare this Study. This Study was funded in part by a grant from the California State Water Resources Control Board (SWRCB) Water Recycling Funding Program.

GOALS AND OBJECTIVES

The Project Team established the following goals and objectives to guide the development of the Bear Valley Water Sustainability Project.

- Create a new and sustainable water supply
- Educate the community about water cycle, recycled water treatment process and water quality to gain public support
- Create a project that benefits all agencies involved
- Develop a cost-effective project to offset potable water demands
- Take advantage of current outside funding opportunities
- Explore viability of developing a fish hatchery to provide community benefits and potentially offset project costs
- Identify the costs of project components and the beneficiaries they will be allocated to

ALTERNATIVES ANALYSIS

This Study leverages prior recycled water planning efforts in the region and evaluates opportunities in the context of current and prospective future regulations. The following three recycled water project alternatives were developed for evaluation in this Study:

- Alternative 1: Provides disinfected tertiary recycled water for landscape irrigation and construction water use. Requires tertiary upgrades to the BBARWA Wastewater Treatment Plant (WWTP).

- Alternative 2: Provides advanced purified water for groundwater recharge at the Greenspot Recharge Site. Requires tertiary and advanced treatment upgrades to the BBARWA WWTP.
- Alternative 3: Provides advanced purified water for groundwater recharge at Sand Canyon Recharge Site. Assumes construction of a satellite treatment plant that provides tertiary and advanced treatment. Due to the unknown volume of dilution water available at this location, a range of treatment requirements were evaluated to identify bookend costs for this alternative.
- Alternative 4: Provides advanced purified water for a groundwater recharge at the Greenspot and Sand Canyon Sites to utilize all of the available recycled water in the Big Bear Valley. Requires tertiary and advanced treatment upgrades to the BBARWA WWTP.

Table ES-1 summarizes the costs and yield of the four alternatives.

Table ES-1. Cost and Yield Comparison for Alternatives Evaluated

Alternative	Alternative 1 Irrigation	Alternative 2 Greenspot	Alternative 3 Sand Canyon (Low Range)	Alternative 3 Sand Canyon (High Range)	Alternative 4 Greenspot and Sand Canyon
Total Capital Cost	$3,257,000	$44,533,000	$23,255,000	$24,315,000	$69,700,000
Annual O&M Cost	$65,000	$1,539,000	$1,174,000	$1,259,000	$2,726,000
Recycled Water Yield (AFY)	54	1,000	520	500	1,750
Unit Cost ($/AF)	$3,960	$3,580	$4,310	$4,750	$3,390
NPV	$5,087,000	$88,172,000	$56,759,000	$60,247,000	$147,270,000

For comparison to the recycled water alternatives, the Study updated a prior analysis that estimated the cost for a non-recycled water alternative to convey imported State Water Project water to the Big Bear Valley from the Morongo Basin pipeline. The estimated unit cost for this imported water concept is $5,630/AF. However, the Big Bear Agencies do not currently have supply contracts with a State Water Contractor and State Water Project water deliveries have declined in recent years and are subject to further reductions based on environmental and hydrologic factors. An imported water supply, if available, would be costlier than recycled water supplies and would not provide a sustainable or drought proof supply for the Valley.

RECOMMENDED ALTERNATIVES

The alternatives analysis concluded that opportunities for non-potable reuse for landscape irrigation in the Valley are limited and not cost effective due to relatively low demands and the extensive distribution system required to reach the customers.

Groundwater recharge was determined to be the most favorable alternative and the Sand Canyon and Greenspot Recharge Sites are both favorable for artificial recharge. Alternative 4 retains all of the available recycled water in the Valley and has the lowest unit cost among all the alternatives considered.

A further discussion of the recommended project is included in Chapter 6.

FUNDING AND FINANCING

The cost estimate for the recommended Alternative 4 is summarized in Table ES-2.

Table ES-2. Cost Summary for Alternative 4

Alternative	Capital Cost	O & M Cost	Recycled Water Yield, AF	Unit Cost, $/AF
Alternative 4: Greenspot & Sand Canyon Recharge	$69,700,000	$2,726,000	1,750	$3,390

The project could be funded through a combination of grants and low interest loans. The SWRCB Water Recycling Funding Program received funding from the 2014 California Water Bond (Prop 1) and is currently offering grant funding for water recycling projects. This grant program, which is described in more detail in Section 8.2.1, is offering 35% grants, with a maximum grant amount of $15,000,000. To illustrate the benefits of this grant program, Table ES-3 summarizes the local portion of the project costs if a 35% grant is received to reduce the local capital contribution.

Table ES-3. Cost Summary with 35% Grant for Alternative 4

Alternative	Capital Cost	O & M Cost	Recycled Water Yield, AF	Unit Cost, $/AF
Alternative 4: Greenspot & Sand Canyon Recharge	$45,305,000	$2,726,000	1,750	$2,750

There may be opportunities to leverage other grant funding programs, such as the United States Department of Agriculture (USDA) Rural Development Water and Environment Program, to further reduce the portion of project costs that must be funded locally.

CONCLUSIONS

The implementation of a Bear Valley Water Sustainability Project that retains highly treated water in the Valley for beneficial use would provide a sustainable and drought proof source of supply that would support current and future residents and businesses long into the future. However, even with taking advantage of current funding programs, such a project would represent a significant investment for the community. The costs and long term benefits to the community should be carefully considered when determining the timing for implementation of the Bear Valley Water Sustainability Project.

1 INTRODUCTION

1.1 BACKGROUND AND PURPOSE

The Big Bear Valley (Valley) is located in the San Bernardino Mountains of San Bernardino County, California. The area includes approximately 135 square miles within a 12-mile long valley surrounded by mountain ridges and rugged slopes. Land surface elevations range from 6,000 to 9,900 ft and the area is entirely surrounded by the San Bernardino National Forest. Big Bear Lake lies within the Valley and has a surface area of approximately 10 square miles and 23 miles of shoreline.

Local groundwater provides the sole drinking water supply for the Valley. Drought conditions and a long-term decline in precipitation trends have led the local water agencies to investigate opportunities for supplemental supplies, which are extremely limited due to its isolated location at the top of the watershed.

Currently, wastewater generated within the Valley undergoes preliminary and secondary treatment and is discharged outside of the watershed to irrigate alfalfa fields in the Lucerne Valley located approximately 20 miles north of the Valley. This Study evaluates alternatives to develop a Bear Valley Water Sustainability Project with the goal to retain highly treated wastewater within the Valley for beneficial use. By doing so, this will provide a supplemental and drought proof source of water for current and future Valley residents and businesses. This Study leverages prior recycled water planning efforts in the region and evaluates opportunities in the context of current and prospective future regulations. This Study was funded in part by a grant from the California State Water Resources Control Board (SWRCB) Water Recycling Funding Program.

1.2 PROJECT TEAM

The Project Team is comprised of the Big Bear Area Regional Wastewater Agency (BBARWA), Big Bear City Community Services District (BBCCSD), Big Bear Lake Department of Water and Power (BBLDWP), and Big Bear Municipal Water District (BBMWD). The Project Team recognizes that retaining recycled water in the watershed for beneficial use would significantly increase the sustainability of local water supplies and has partnered to jointly fund and prepare this Study. The following sections provide a brief introduction to each agency.

1.2.1 BBARWA

BBARWA was formed in March 1974 to conduct a study to develop a plan for wastewater management within the greater Valley region. A subsequent 1975 Wastewater Facilities Plan was prepared which identified the need to provide centralized, environmentally friendly wastewater conveyance, treatment and disposal for the BBARWA service area.

The BBARWA service area includes the entire Big Bear Valley (79,000 acres) and is served by three separate collection systems: the City of Big Bear Lake, representing approximately 47% of the connections, and the BBCCSD, representing approximately 48% of the connections, and the County of San Bernardino Service Area 53B (CSA 53), representing approximately 5% of the connections. Each of these member agencies maintains and operates its own wastewater collection system, and delivers wastewater to BBARWA's interceptor system for transport to the BBARWA Regional Wastewater Treatment Plant (WWTP).

1.2.2 BBCCSD

BBCCSD was created in 1966 by a formation and consolidation election and initially provided solid waste collection, fire protection and street lighting services. In 1967, the former Big Bear Mutual Service Company voted to relinquish ownership and operation of their water system to BBCCSD. Currently BBBCSD's services include water, wastewater collection, fire protection & emergency medical services, solid waste collection, and street lighting services. BBCCSD's water service area includes Big Bear City and portions of San Bernardino County. BBCCSD's wastewater collection area includes Big Bear City and portions unincorporated communities such as Sugarloaf, Erwin Lake, Whispering Forest, and Moonridge.

1.2.3 BBLDWP

BBLDWP was formed in 1989 with the purchase of the retail water system from Southern California Water Company and currently provides water service to the City of Big Bear Lake, located along the south side of Big Bear Lake, as well as the unincorporated communities of Fawnskin, which lies to the north of the lake, and Sugarloaf, Erwin Lake and Lake William areas, which lie on the east side of the Valley.

The City of Big Bear Lake provides wastewater collection services within the city, while BBCCSD and CSA 53B provide wastewater collection services within BBLDWP's water service area that lies outside the city limits.

1.2.4 BBMWD

BBMWD, formed in 1964, is an independent special district that is responsible for the overall management of Big Bear Lake. The primary responsibilities of BBMWD are:

- Stabilization of the level of Big Bear Lake by managing the amount of water released to Bear Valley Mutual
- Watershed/water quality management
- Recreation management
- Wildlife habitat preservation and enhancement
- Bear Valley Dam and Reservoir maintenance

The Big Bear Dam was originally constructed to provide water storage for Bear Valley Mutual Water Company (Bear Valley Mutual), which was formed in 1903 by the citrus growers of the Redlands/Highland area to ensure water supply for irrigation needs. The historic operation of the Big Bear Lake (Lake) as an irrigation reservoir resulted in drastic fluctuations in lake levels, which conflicted with the goals of BBMWD and the community of Big Bear Valley. A legal conflict over the water rights and management of the lake was ultimately settled out of court through the 1977 Judgement. Under the terms of this judgement, BBMWD purchased the lake bottom, Bear Valley Dam, and the right to utilize and manage the surface of Big Bear Lake from Bear Valley Mutual. Bear Valley Mutual retained a storage right and ownership of all water inflow into Lake (1).

The 1977 Judgment allows BBMWD to maintain a higher water level in the lake by delivering water to Bear Valley Mutual from an alternate source of water. This alternate source of water, referred to as in-lieu water, comes mainly from the State Water Project through a contract with San Bernardino Valley Municipal Water District, a State Water Contractor. If BBMWD does not wish to purchase in-lieu water, it must deliver water from the Lake to Bear Valley Mutual to meet their water demands.

BBMWD currently has a contract with the Big Bear Mountain Resorts, allowing the withdrawal of an allocated amount of water from the Lake to use for snow making purposes. Currently, Big Bear Mountain Resort is authorized to withdraw a maximum of 11,000 acre-feet (AF) of water from the Lake over a 10-year rolling period, not exceeding 1,300 AF in any single year. It is calculated that half of the water withdrawn from the lake is returned as runoff (1). Note that Mammoth Resorts recently purchased the Big Bear Mountain Resorts and potential future changes in their operations may affect water needs and wastewater generation from the resorts.

1.3 GOALS AND OBJECTIVES OF BEAR VALLEY WATER SUSTAINABILITY PROJECT

Members of the Project Team identified goals and objectives for the Bear Valley Water Sustainability Project through discussions with potential stakeholders, insight gained from prior recycled water planning efforts, and feedback from their respective boards. Based on the information gathered through this collaborative process, the Project Team established the following goals and objectives to guide the development of the Bear Valley Water Sustainability Project.

- Create a new and sustainable water supply
- Educate the community about the hydrologic cycle, recycled water treatment processes, and water quality objectives to gain public support for the project
- Create a project that benefits all agencies involved
- Develop a cost-effective project to offset potable water demands
- Take advantage of current outside funding opportunities
- Explore viability of developing a fish hatchery to provide community benefits and potentially offset project costs
- Identify the costs of project components and the beneficiaries they will be allocated to

1.4 STUDY AREA CHARACTERISTICS

1.4.1 Location

The study area for this Study includes the entire Big Bear Valley, spanning the collective service areas of the Project Team. The water service areas in the study area are shown in Figure 1-1 and the sewer collection service areas are shown in Figure 1-2.

1.4.2 Population

The 2015 population for the Big Bear Valley was estimated to be approximately 23,000 based on the BBCCSD 2015 Urban Water Management Plan (UWMP) and BBLDWP 2015 UWMP (collectively the 2015 UWMPs). The area is primarily residential with some commercial, and experiences an influx of part-time population and vacationers enjoying the summer and winter recreational facilities within the valley. Due to the recreational nature of the Big Bear City and the City of Big Bear Lake economies, occupancy within the valley fluctuates seasonally, typically peaking in July and at the lowest level during the winter. Population and recreation fluctuations are anticipated to remain constant relative to previous years. The City of Big Bear Lake's growth rate is estimated to be 0.7% and Big Bear City's growth rate is 0.9%. Table 1-1 presents the historic and projected full-time resident population for the Big Bear Valley.

Table 1-1. Historic and Projected Population for the Big Bear Valley

Water Service Area	2010	2015	2020	2025	2030	2035
BBLDWP	9,404	11,382	11,786	12,204	12,637	13,086
BBCCSD	11,503	11,528	11,667	12,244	12,849	13,485
Total	**20,907**	**22,910**	**23,453**	**24,448**	**25,486**	**26,571**

Notes:
1. Values were obtained from the 2015 BBLDWP UWMP and the 2015 BBCCSD UWMP.
2. Values are representative of full-time residents.
3. CSA 53B represents approximately 5% of BBARWA's sewer connections. (2) It is assumed that BBARWA's CSA 53B customers (in Fawnskin) are included in the BBLDWP Water Service Area population estimate.

1.4.3 Environmental Resources

In 2005, BBARWA prepared a Program Environmental Impact Report (EIR) for the Recycled Water Master Plan. (3) The EIR describes the environmental resources in the area, which are summarized in the following subsections.

1.4.3.1 *Geography*

The Valley is located in the San Bernardino Mountains in San Bernardino County, California. The Valley includes approximately 135 square lies of unincorporated area surrounding Big Bear Lake and is entirely surrounded by the San Bernardino National Forest. The valley's land surfaces range from 7,000 to 9,900 ft and is surrounded by mountain ridges and rugged slopes. Big Bear Lake, at an elevation of 6,740 ft, has a surface area of 10 square limes and 23 miles of shoreline.

1.4.3.2 *Water Resources and Wetlands*

Groundwater is the current water resource in the Valley. The Big Bear Valley Groundwater Basin contains 16 subunits as shown in Figure 2-1. The study area contains a variety of wetlands and aquatic habitats, a number of streams with riparian habitat and typical wetlands along the lake.

1.4.3.3 *Agricultural*

The Valley does not contain any commercial agricultural operation. The San Bernardino County General Plan (1996) discourages agricultural land use in mountain regions.

1.4.3.4 *Cultural and Historical Properties*

Within the Valley there are several designated California Historical Landmarks and County Points of Historic Interest including the Old Big Bear Dam and Baldwin Lake. The area was occupied by the Serrano Native Americans until 1861. Smaller villages were located near water sources like small creeks with larger villages situated at Pan Hot Springs and in the Baldwin Lake area. No recorded Native American sites have been identified in the area.

1.4.3.5 *Biological Resources*

There are many biological resources within the Valley including forest, streams, lakes, meadows, unique animals, and plants that are protected by numerous federal and state agencies and regulations. Some of the major protected animals include the Bald Eagle, Southern Rubber Boa, Southwestern Willow Flycatcher, Unarmored Threespine Stickleback, and the San Bernardino Flying Squirrel. A more detailed list of the protected animals and plants is included in the EIR.

1.4.3.6 *Air Quality*

The Valley lies just within the South Coast Air Basin, which is one of the major air management basins in California. Since the Valley is not located near the Cajon Pass and Banning Pass, which transport pollution out of the basin, the Valley is believed to have better air quality than elsewhere in the basin, during winter and summer. (3)

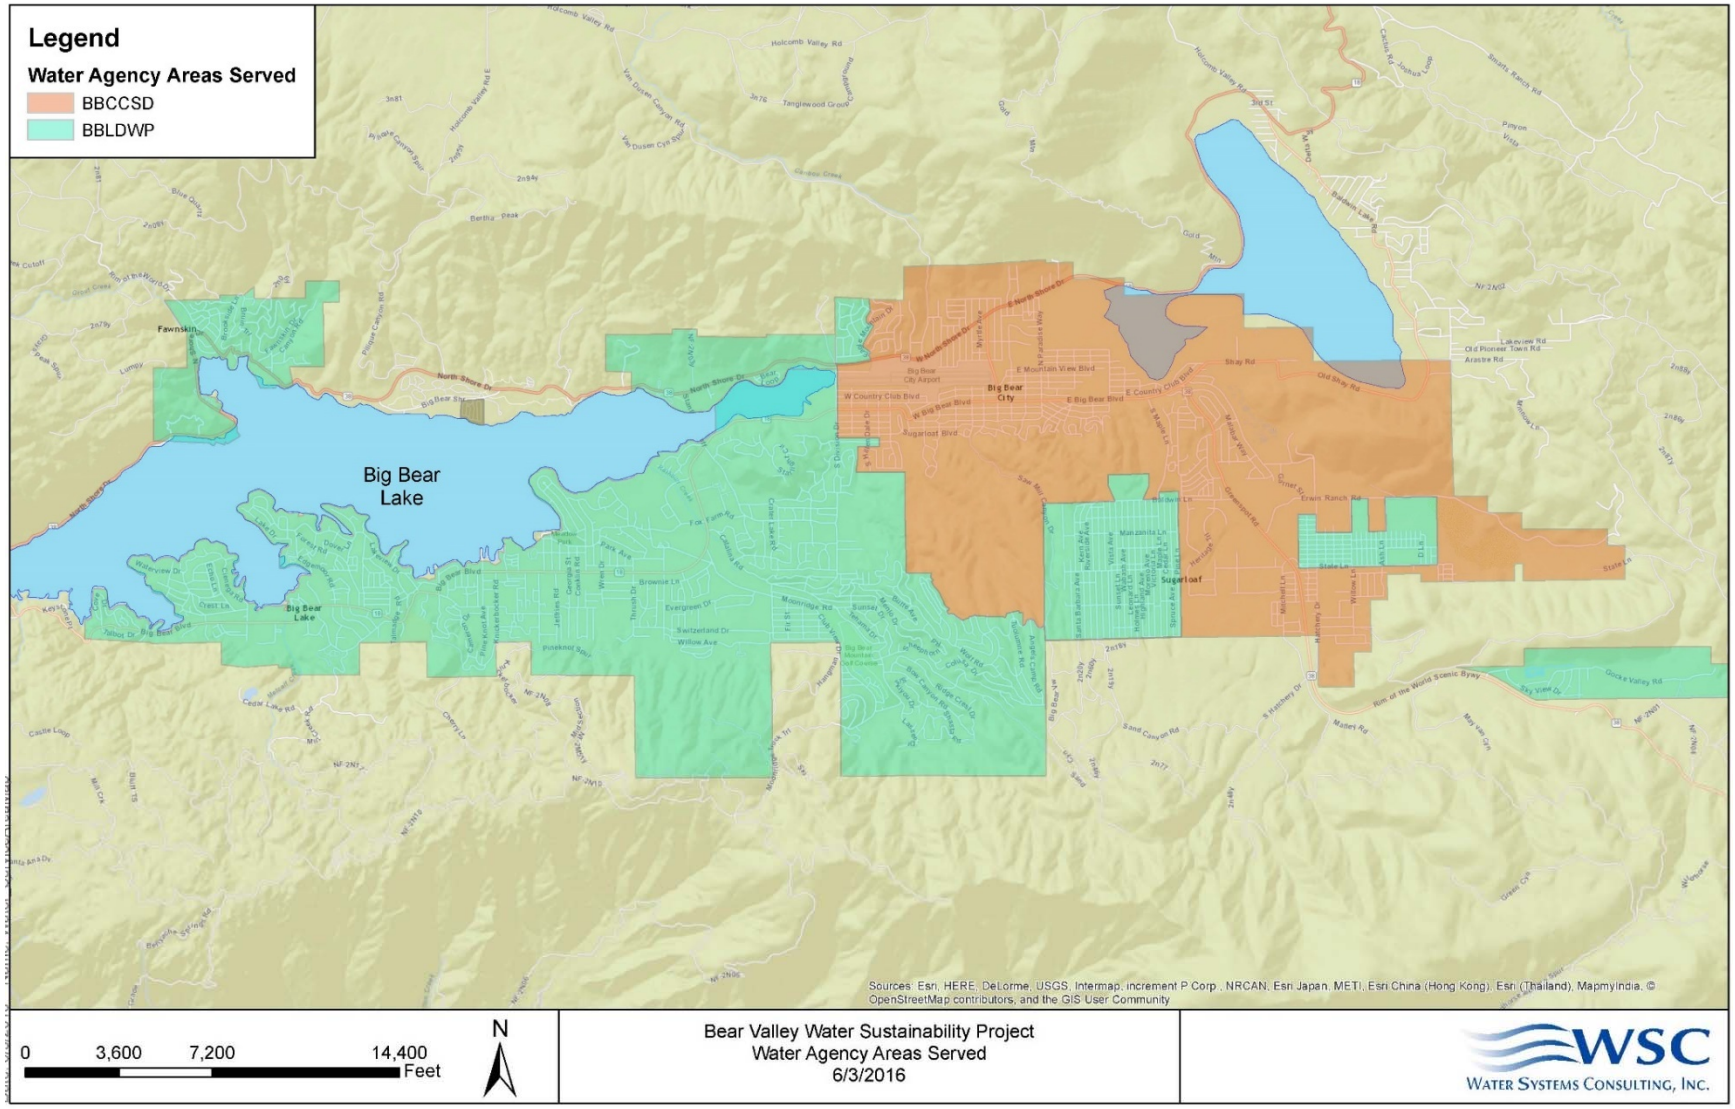

Figure 1-1. Water Agency Service Area

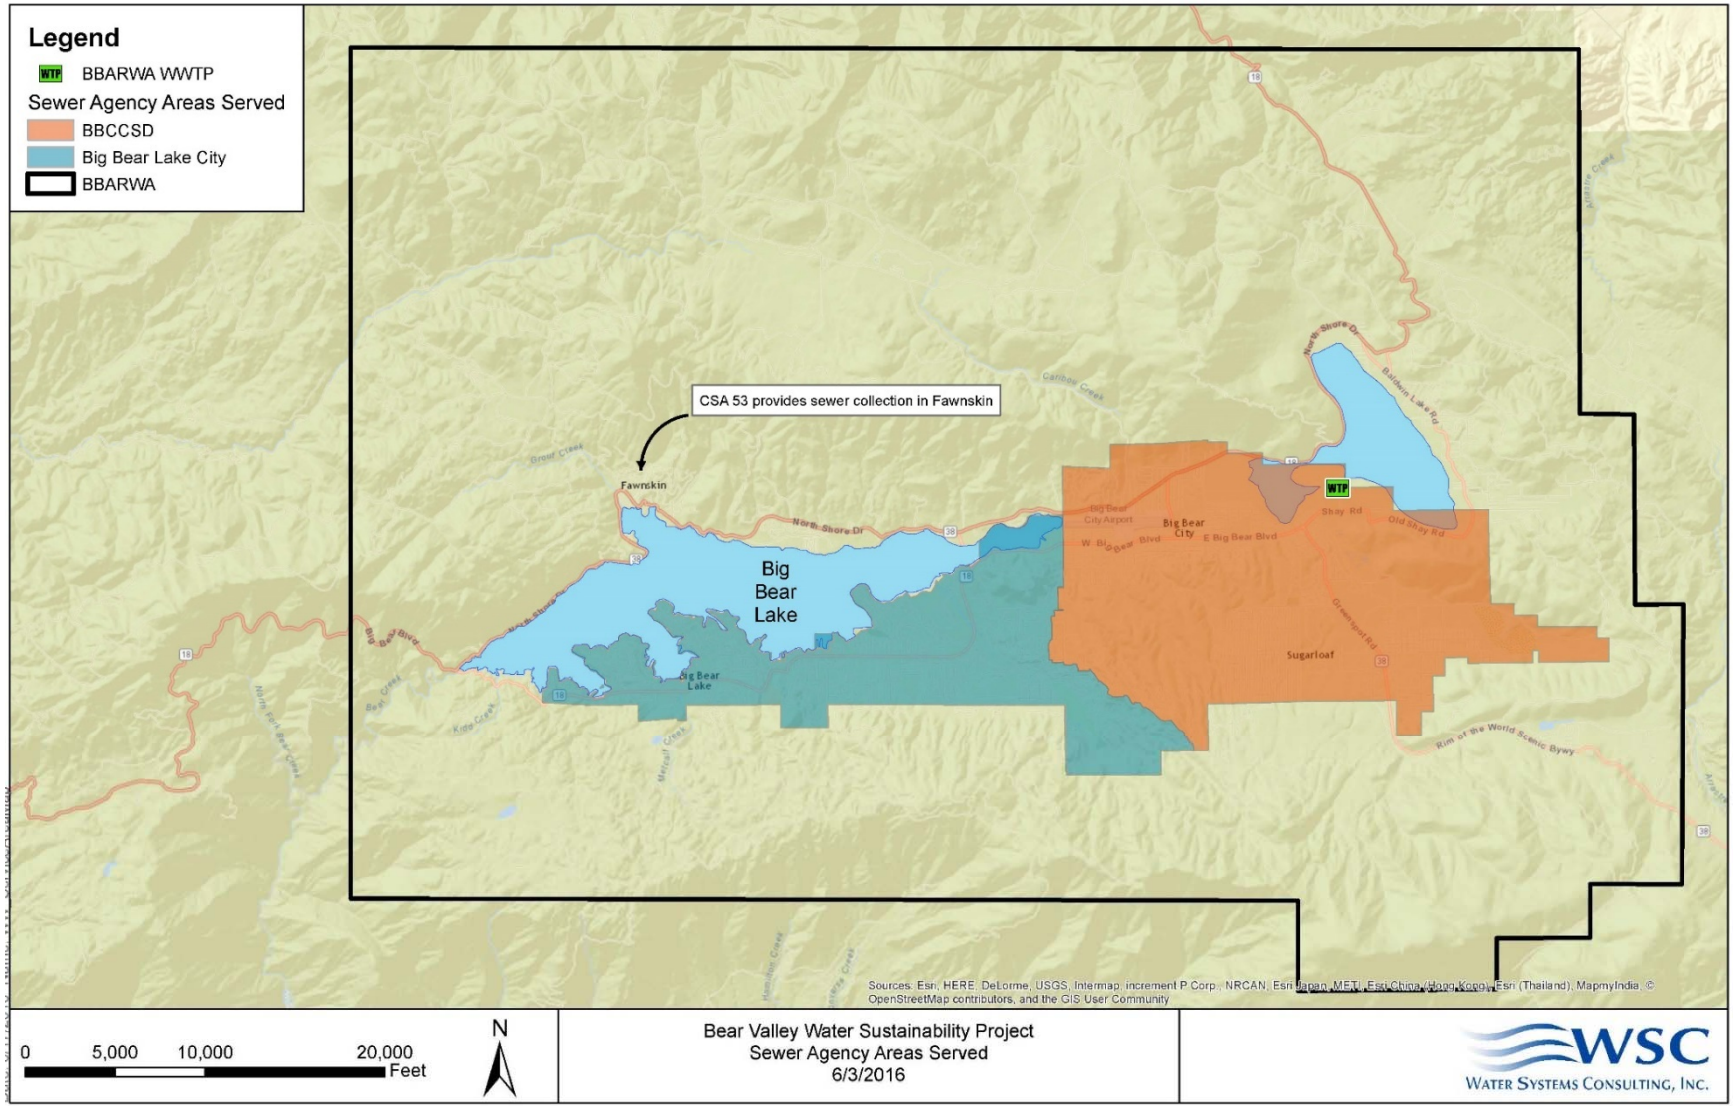

Figure 1-2. Sewer Collection Agency Service Area

1.4.4 Climate

The Valley climate is a semi-arid, Mediterranean environment with cold winters, warm summers, and moderate rainfall. The average monthly temperature ranges from about 32 to 62 degrees Fahrenheit (°F), with an average annual temperature of 47°F. Most of the precipitation typically occurs from November through April. Records show that the average monthly precipitation ranges from about 0.1 in to 7.10 in. The historical precipitation and temperatures are presented in Figure 1-3 and Figure 1-4.

As shown, precipitation trends are declining and temperature trends are increasing. These long term trends can have an impact on the sustainability of local water supplies in the Valley. The potential impacts include (4):

- Reduction of snowpack, which is a significant source of water in the Valley
- Increase in intensity and frequency of extreme weather events
- Effects on groundwater recharge during droughts
- General decline in ecosystem health and function
- Changes to demand level and patterns due to increasing temperatures

These factors reinforce the importance of securing additional sustainable water supplies for the region.

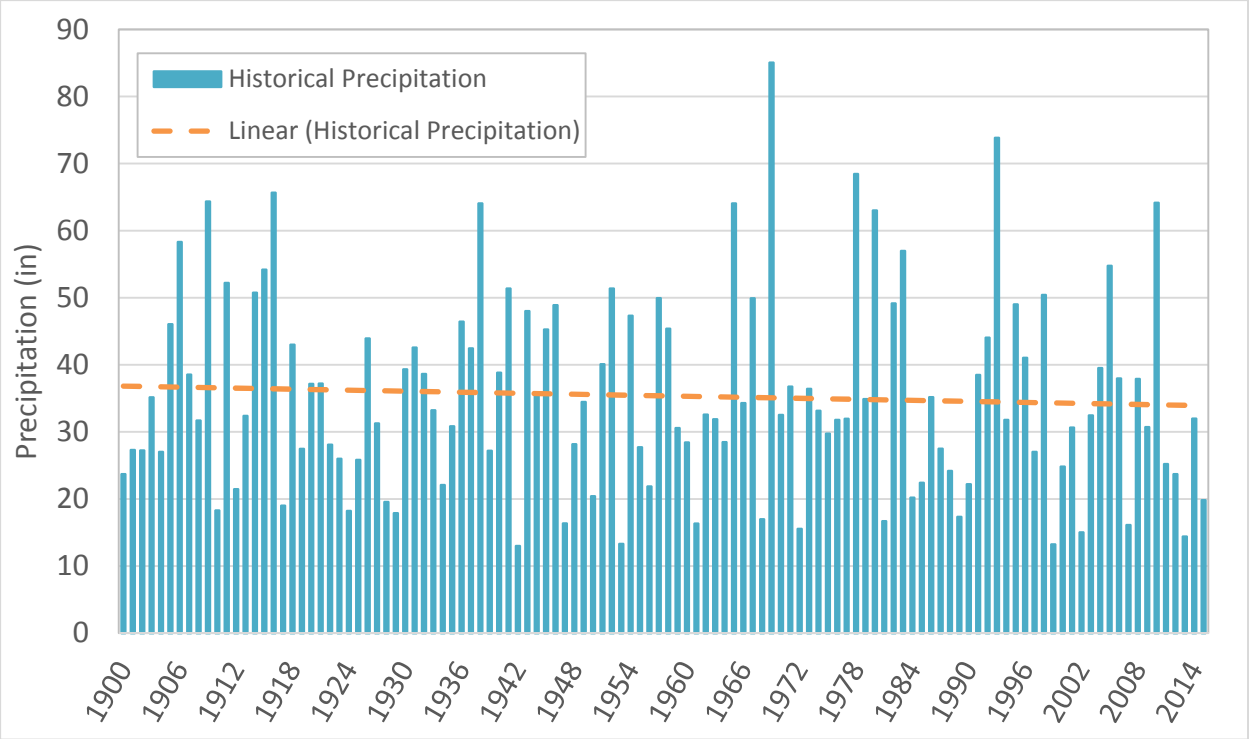

Figure 1-3. Historical Precipitation in the Big Bear Valley (5)

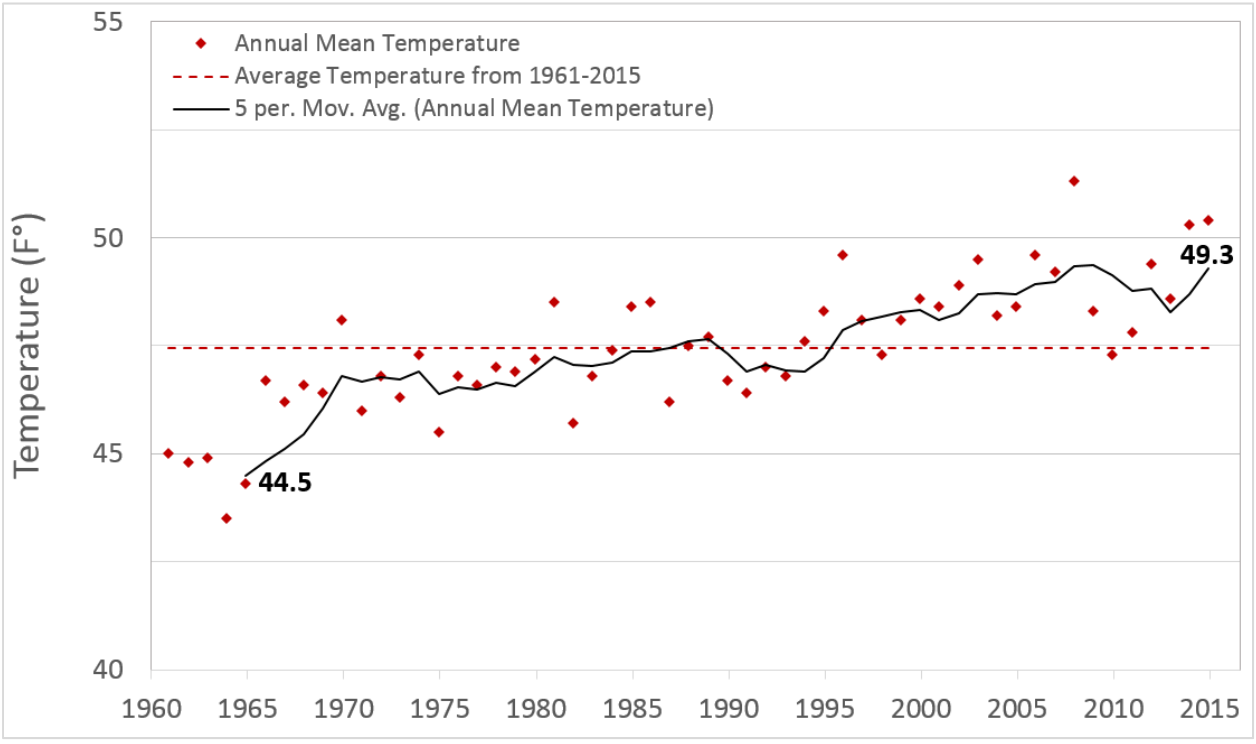

Figure 1-4. Historical Average Annual Temperatures in the Big Bear Valley (6)

2 WATER SUPPLIES AND CHARACTERISTICS

This section provides a brief overview of current water supplies in the Big Bear Valley to provide context for the development of recycled water supplies. Currently, the sole source of water supply in the Valley is groundwater from the Big Bear Valley Groundwater Management Zone (Basin). Surface water and imported water are currently not used by the water agencies. Additional information about water supplies can be found in the 2015 UWMPs.

2.1 BIG BEAR VALLEY GROUNDWATER MANAGEMENT ZONE

The Basin lies in the northeastern portion of the Santa Ana River Watershed and is currently not adjudicated. The Basin is roughly 14 miles long from east to west and 7 miles wide from north to south. Big Bear Lake and Baldwin Lake are located in the middle of the Basin. Surface drainage within the Basin flows to one of the two lakes, mostly Big Bear Lake. Big Bear Lake empties on the west into Bear Creek, which is a tributary to the Santa Ana River. The Basin is primarily composed of unconsolidated alluvium and is divided into upper, middle and lower aquifers; where the upper and middle aquifers are the primary producers. Based on the drainage system, the Basin is divided into 16 hydrologic subunits with the main tributaries including Grout Creek, Van Dusen Canyon, Sawmill Canyon, Sand Canyon, Knickerbocker Creek, Metcalf Creek, and North Creek. The Basin and subunits are presented in Figure 2-1.

The Basin is recharged from percolation of precipitation, runoff and underflow from fracture rock formations; with groundwater levels that generally correlate with annual fluctuations of precipitation. Storage capacity of the Basin is estimated by DWR at 42,000 AFY with the maximum perennial yield estimated at 4,800 AFY (7). In addition to the municipal water purveyors, there are numerous private wells throughout the Basin serving properties that are not connected to a public water system.

BBLDWP and BBCCSD manage and monitor the Basin. Through the Groundwater Monitoring and Management Plan, BBLDWP manages the Basin by conducting monthly monitoring of 18 non-pumping monitoring wells and approximately 40 production wells, bi-annual Technical Review Team meetings, and has established conservation levels based on groundwater levels and trends in key wells. BBCCSD also manages the groundwater level and water quality by conducting monthly monitoring in 11 non-pumping monitoring wells and 13 production wells, monthly monitoring of surface flow in Van Dusen Creek, Shay Creek and Green Canyon Creek, and has established action criteria for average groundwater levels across the BBCCSD service area that are tied to conservation stages and measures. Conservation efforts have helped to keep annual groundwater production less than the perennial yield of the Basin. The Basin is not currently identified by DWR to be in overdraft condition. (4) (8)

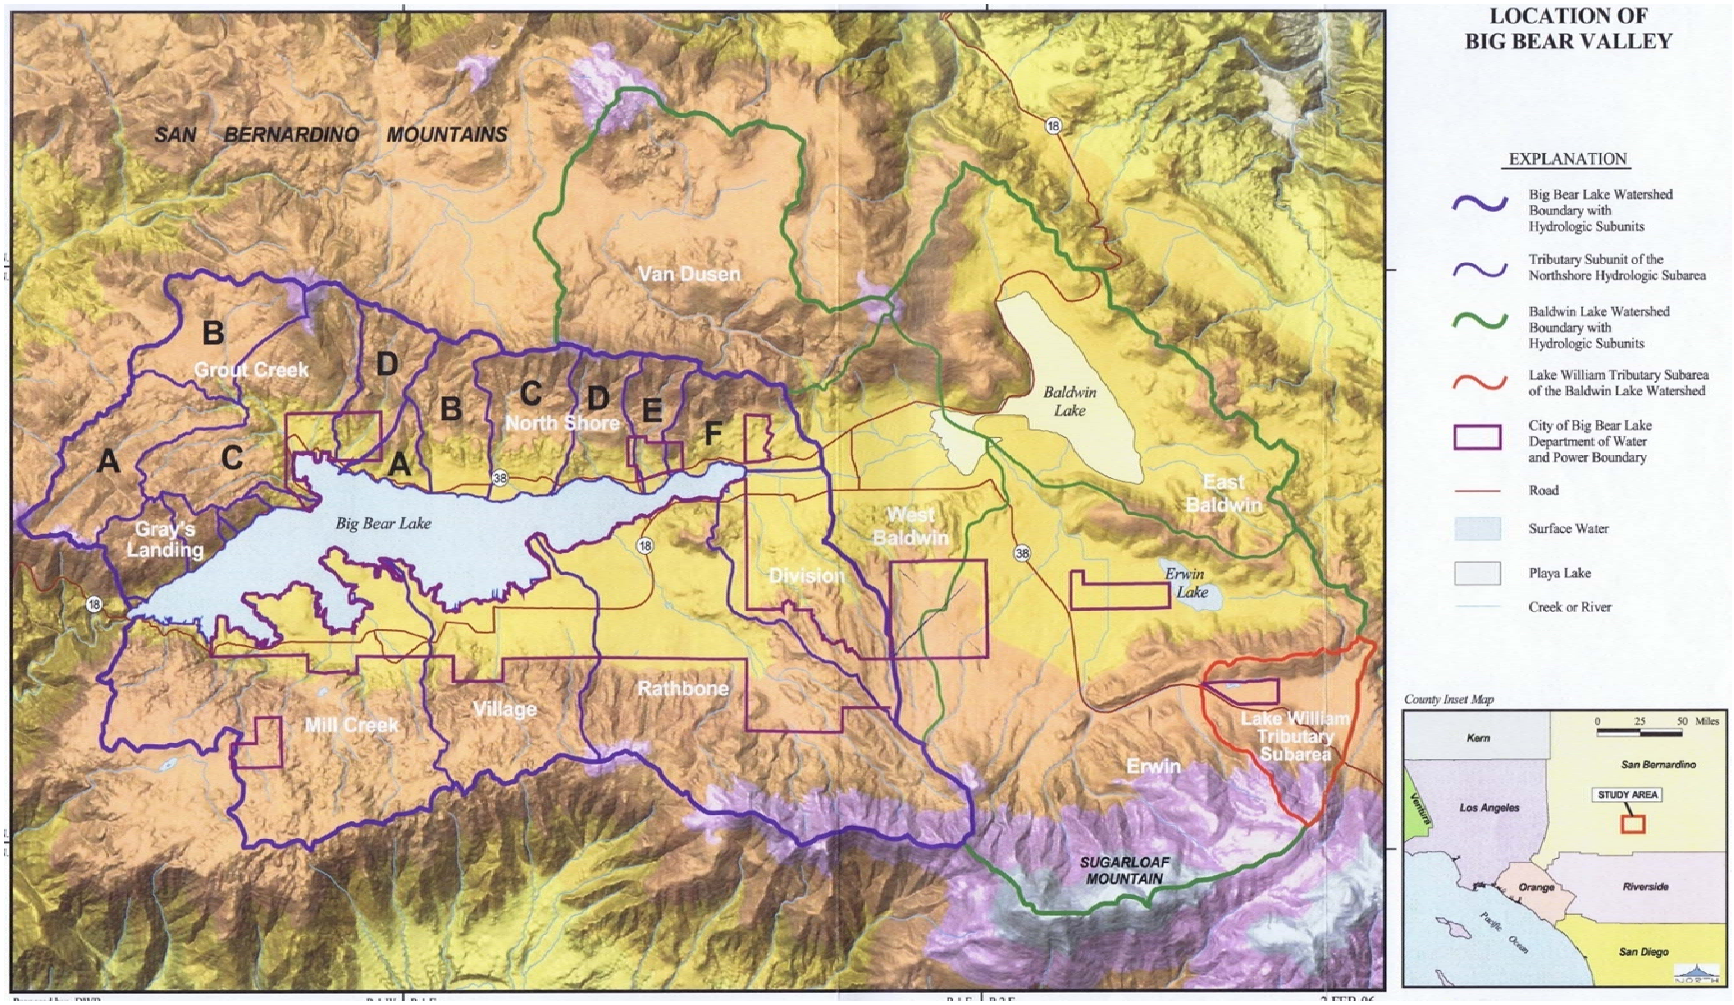

Figure 2-1. Big Bear Valley Groundwater Basin and Subunits (9)

2.2 WATER DEMAND AND USE TRENDS

The BBLDWP service area is primarily residential with commercial accounts making up 5% and industrial making up less than 1% of the total accounts. BBCCSD serves only residential accounts. The projected water demands for BBLDWP and BBCCSD area are presented in Table 2-1. The historical and projected water demands for each water agency along with the total demands for the agencies are presented in Figure 2-2. These estimates do not include water used from private wells, which was estimated to be approximately 169 AFY in the BBLWDP 2006 Water Master Plan (7).

Table 2-1. Water Demand Projections for Bear Valley Water Agencies (AFY)

Water Agency	2015	2020	2025	2030	2035
BBLDWP[1]	2,095	2,169	2,246	2,326	2,408
BBCCSD[2]	940	1,163	1,220	1,281	1,344
Total	3,035	3,332	3,466	3,607	3,752

Note:

2. BBCCSD 2015 UWMP

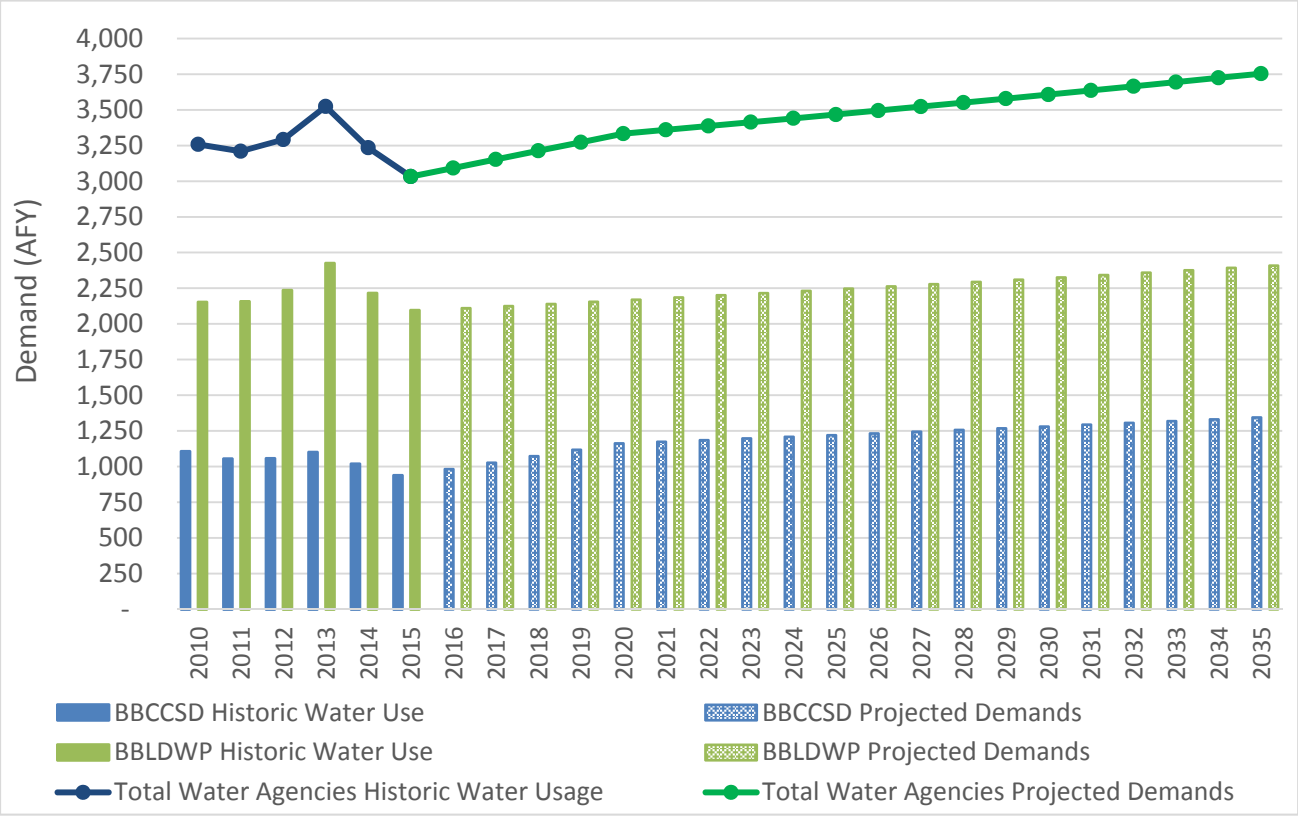

Figure 2-2. Historic and Projected Water Demands

2.3 WATER QUALITY

As stated in the 2015 UWMPs, the Basin generally contains high water quality. The BBLDWP 2015 UWMP states that the eastern portion of the Basin does contain elevated fluoride levels and there are other problem constituents including manganese, uranium, and arsenic. Water treatment plants, occasional blending projects and wells being shut down address these problems; however, these potential water quality issues are not anticipated to disrupt groundwater supply.

Total dissolved solids (TDS) concentrations in the Big Bear Valley groundwater supplies range from 140 to 450 mg/l with an average of 250 mg/l in the Big Bear Valley (10) (11). For recycled water projects, the concentration of TDS (or salts) in the water are of importance because high TDS RW can impact beneficial uses as well as treatment costs. For groundwater recharge applications, elevated TDS levels may be prohibited in order to protect the groundwater quality. In this case, excess salts would need to be removed, resulting in higher costs for FAT process construction and operation, as well as the brine management system. In RW irrigation applications, elevated TDS levels in the RW can be harmful to landscape plants or turf due to salt buildup in the root zone. Salt buildup in landscape applications can often be managed and is not likely to require additional treatment.

2.4 WATER PRICING

BBLDWP and BBCCSD have similar water rate structures comprised of 2 components: rates per hundred cubic foot (CCF) to account for variable costs and water service charges to account for fixed costs. Both BBLDWP and BBCCSD's billing cycles are bi-monthly. The current rate structures are shown in Table 2-2 and Table 2-3 for BBLDWP and Table 2-4 and Table 2-5 for BBCCSD.

Table 2-2. BBLDWP Fixed Rates

Fixed Rates	Residential Service	Commercial Service
Bimonthly service charge, 5/8" meters	$87.66	$51.92
Bimonthly service charge, 1" meters	$156.92	$86.55
Service charge base rate	0-8 ccf	0-4 ccf
Note: 1. Rates as of May 2016 available at http://www.bbldwp.com/		

Table 2-3. BBLDWP Tier Rates

Level	Water Amount (ccf)	Rate ($/ccf)
Residential Service Rates		
Tier 1	9-24	$2.64
Tier 2	25-40	$3.67
Tier 3	41-60	$5.47
Tier 4	61-100	$9.31
Tier 5	101+	$12.53
Commercial Service Rates		
Tier 1	5+	$3.79
Note: 1. Rates as of May 2016 available at http://www.bbldwp.com/		

Table 2-4. BBCCSD Base Rates

Meter Size	Base Rate
5/8", 3/4", 1"	$63.43
1 1/2"	$126.85
2"	$202.96
3"	$380.56
4"	$634.26
6"	$1268.52
Note: 1. Rates as of May 2016 available at http://www.bbccsd.org/	

Table 2-5. BBCCSD Tier Rates

Meter Size	Tier 1 (hcf)	Tier 2 (hcf)	Tier 3 (hcf)
5/8", 3/4", 1"	0-12	13-38	Over 38
1 1/2"	0-24	25-48	Over 48
2"	0-38	39-77	Over 77
3"	0-72	73-144	Over 144
4"	0-120	121-240	Over 240
6"	0-240	241-480	Over 480
Tier Cost ($/hcf)	$1.63	$1.75	$2.43
Note: 1. Rates as of May 2016 available at http://www.bbccsd.org/			

3 WASTEWATER CHARACTERISTICS AND FACILITIES

BBARWA owns and operates a 4.9 million gallons per day (MGD) capacity WWTP located just south of Baldwin Lake on the east side of the Valley. The WWTP currently treats approximately 1.76 MGD of municipal wastewater collected from BBCCSD, the City of Big Bear Lake and the CSA 53 in the community of Fawnskin.

3.1 EXISTING AND PROJECTED WASTEWATER FLOWS

The influent flows to BBARWA's WWTP are comprised of three components:

- Flow from full-time residential homes
- Flows due to tourism, commercial activities and part-time residential homes
- Flows from Infiltration and Inflow (I/I) due to precipitation

These components create a seasonal variation in the wastewater flows treated at the plant. Figure 3-1 illustrates the monthly variation of the flows due to each wastewater flow components. The monthly base flows correspond to flows from full-time residents; while the monthly other flows are comprised of flows from seasonal residents or tourism. Based on full-time residency rates from BBCCSD and BBLDWP and the number of full-time dwelling units reported by Bear Valley Electric, BBARWA's 2010 Sewer Master Plan (2010 SMP) estimated that the full-time residential rate is 38% (2).

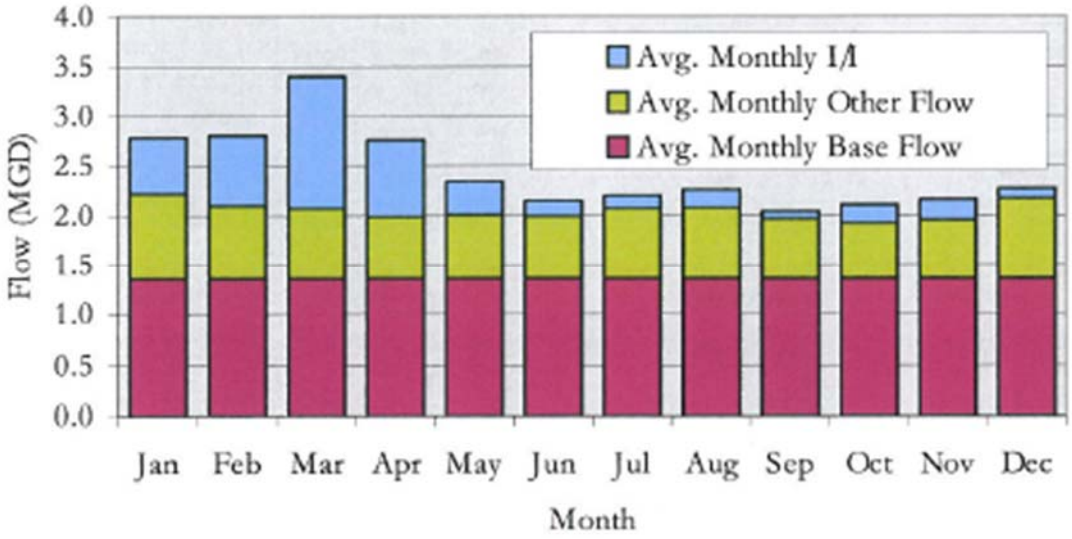

Figure 3-1. Seasonal Variation of BBARWA's Wastewater Flows (2)

The tourism season is largely concentrated in the months of December through April due the local ski resorts. The months of June and July also see a slight rise in tourism due to Lake recreation activities. Average daily flows and the seasonal variation from 2011 to 2015 are shown in Figure 3-2. The average daily flow for this time period is approximately 2.1 MGD and the maximum month flow is 5.5 MGD. In 2015, the annual average effluent flow was 1.76 MGD and the maximum month flow was 2.32 MGD in January 2015. The highest daily influent flow of 3.30 MGD occurred on January 2, 2015.

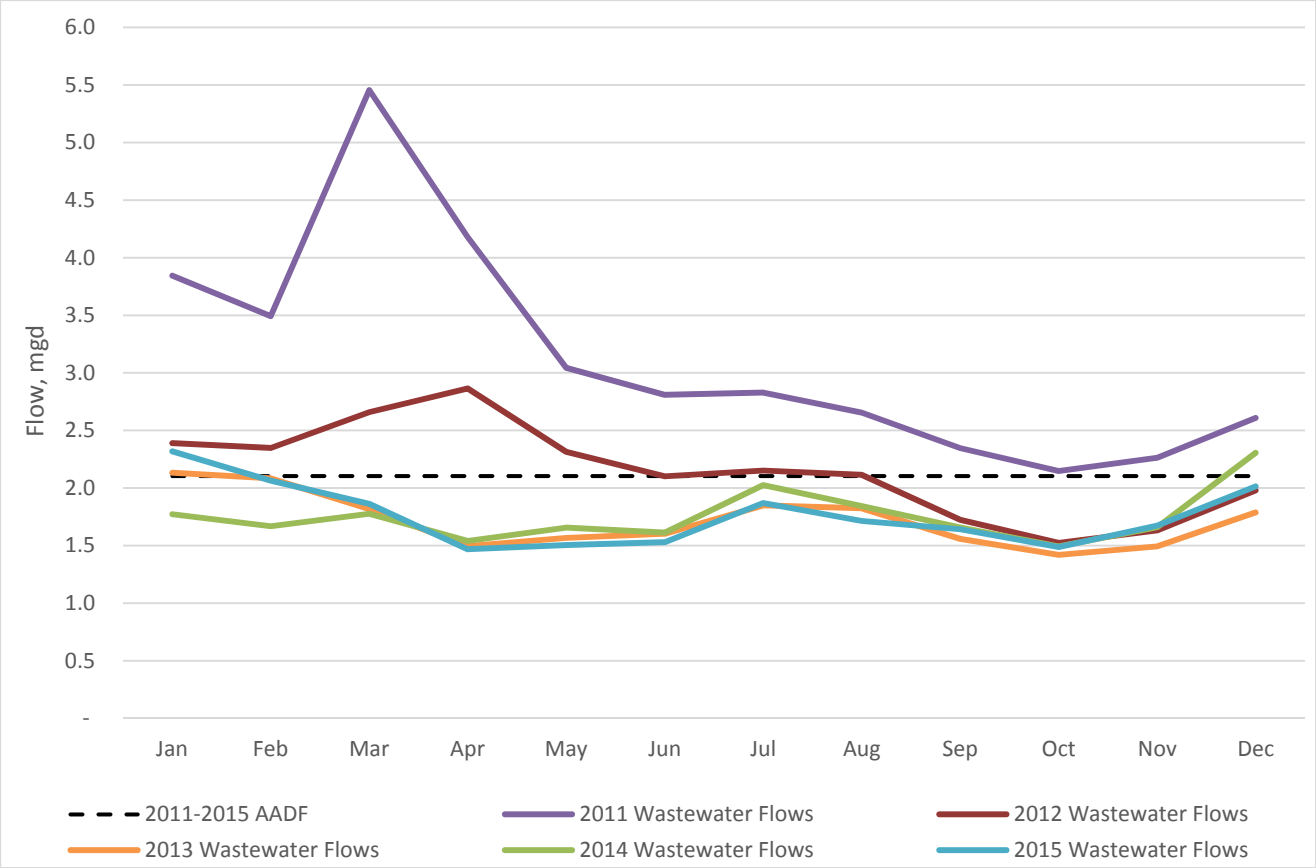

Figure 3-2. Average Daily Flows by Month (2011-2015)

The 2010 SMP estimated the future sewer flows based on future population and equivalent dwelling unit (EDU) projections utilizing the constant sewer load index of 172 gallons per day for full time residential EDUs. For the purposes of this Study, an EDU is defined as the amount of wastewater flow generated by one single-family residence. The 2010 SMP assumes the full-time EDUs will increase at an annual rate of 0.8% over a 20-year period based on a long-term average.

Assuming the full-time residence rate remains at 38% and that I/I will be consistent with the previous average, the 2010 SMP projects that the average annual sewer flows will increase from 2.1 MGD to 2.73 MGD by 2030. If the full-time resident sewer component factor grows to 100 %, the plant could see flows up to 5.27 MGD in 2030.

3.2 EXISTING FACILITIES AND DISCHARGE REQUIREMENTS

BBARWA's WWTP is located on a 93.5-acre lot. The WWTP process components occupy 11.2 acres and the remaining 82.3 acres include storage ponds and evaporation ponds. Influent flows are conveyed through three BBARWA operated sewer mains and lift stations to the plant.

- Lake Interceptor Line: Serves the City of Big Bear Lake's sewer system and uses the Lake Pump Station to convey flows to the WWTP
- North Shore Interceptor: Serves SBC 53B sewer system and conveys flows to the BBARWA Trunk Line
- BBARWA Trunk Line: Serves BBCCSD's sewer system and conveys flows from the North Shore Interceptor. Pump Station #1, Pump Station #2 and Pump Station #3 are used to pump flows to the WWTP.

The WWTP currently provides preliminary and secondary treatment. Table 3-1 summarizes the WWTP's treatment processes and the process flow diagram is depicted in Figure 3-3.

Table 3-1. BBARWA's WWTP Treatment Process

Treatment Process[1]	Description
Preliminary Treatment	Consists of bar screens, grit removal and disposal of solids
Secondary Biological Treatment	Consists of oxidation ditches which uses mechanical aeration to achieve organic material stabilization, nutrient removal and pathogen reduction. Solids production is minimized by the Cannibal® Solids Reduction System, through use of a side-stream interchange bioreactor with aeration controlled by the ORP level.
Secondary Sedimentation Treatment	Consists of clarifiers to settle solids. Waste activated sludge (WAS) is pumped to a dissolved air floatation (DAF) system
WAS Thickening	Consists of a DAF system that skims sludge for sludge dewatering. Filtrate is returned to oxidation ditches.
Sludge Dewatering[2]	Sludge is dewatered using a belt press and a heated drying facility. The drying facility consists of a covered building where floors are heated by the WWTP's generator exhaust. This allows for sludge to be dewatered throughout the year instead of summer only. The dry solids are hauled to a composting facility in Redlands.

Notes:
1. Descriptions obtained from the 2005 BBARWA Recycled Water Master Plan unless otherwise noted.
2. Obtained from BBARWA's website - http://bbarwa.org

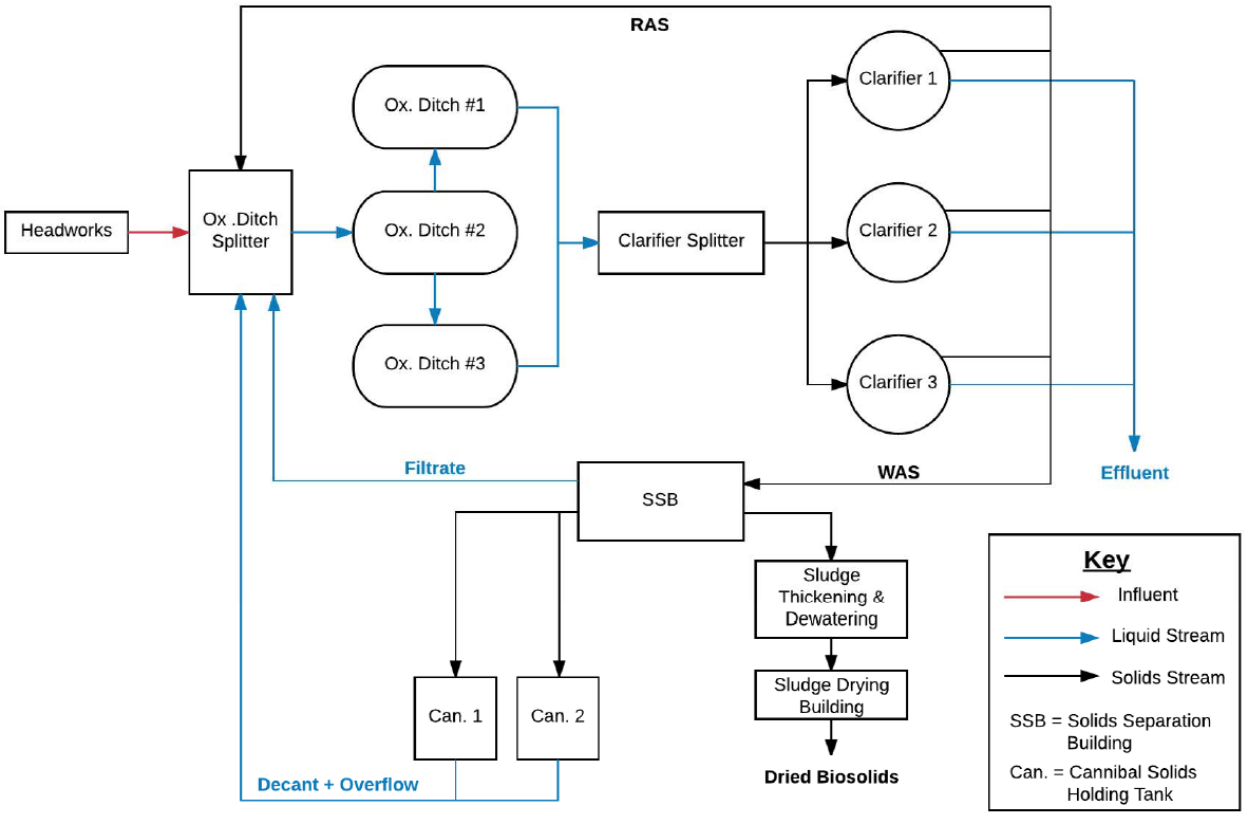

Figure 3-3. BBARWA WWTP Process Flow Diagram

BBARWA recently completed several upgrades to the sludge dewatering process. Heat exchangers were installed on the existing generator to capture waste heat; hot water from the heat exchangers is used to heat the floor of the lined drying bed. A metal building was also constructed to cover the lined drying bed that measures 315-ft in length and 60-ft in width so that the dewatering process could operate year round.

BBARWA's WWTP generates its own electricity using three natural gas generators that can be run in parallel: two 250 KW Cummins generators and one Waukesha generator with a rating of 600 kilowatts for a total generating capacity of 1100 kilowatts. BBARWA only generates the energy needed to operate the WWTP and Administration Building and typical generation is in the range of 225,000 - 350,000 kilowatt-hours (kW-hr) per month. In 2015, total energy generation was 3,100,216 kW-hr. Natural gas consumption was 43,544 million British Thermal Units (MMBTU) or 435,440 therms. BBARWA also has a connection to the Bear Valley Electric utility system that is used to run its pumping stations and can serve as an emergency backup power supply for the WWTP.

3.2.1 Existing Discharge Requirements

The wastewater stream that is treated by the WWTP consists of sewage generated from urban land uses. There are no significant sources of major industrial waste or processing water treated by the facility (2). The WWTP discharge is currently regulated by the Santa Ana Regional Water Quality Control Board (RWQCB) under Waste Discharge and Producer/User Water Recycling Requirement (WDR) Order No. R8-2005-0044 (Santa Ana WDR) issued on June 24, 2005. There are three permitted discharge locations, summarized in Table 3-2. Discharge Point 001 for irrigation in Lucerne Valley, is located within the Colorado River Basin Region and is regulated by Colorado River Basin RWQCB WDR Order No. R7-2016-0026 (Colorado WDR), issued on June 30, 2016.

Treated secondary effluent is discharged to a 480-acre site in Lucerne Valley (LV Site) for irrigation of fodder and fiber crops that are used as feed for livestock. Use of recycled water for crop irrigation at the LV Site began in 1980 and 100% of the WWTP effluent is currently discharged to the LV Site. Figure 3-4 depicts the location of BBARWA's existing recycled water distribution facilities and the LV Site, approximately 20 miles north of the Valley.

Table 3-2. WDR Order No. R8-2016-0044 Discharge Points

Discharge Point	Effluent Description	Receiving Water/Disposal Site	Recycling Reuse
001[1]	Secondary effluent w/o disinfection	Storage Ponds in Lucerne Valley	Irrigation in Lucerne Valley
002	Secondary effluent with disinfection	State surface water (Storage pond in Baldwin Lake) and Big Bear Valley Groundwater Management Zone	Construction and wildlife habitat
003	Tertiary effluent with disinfection	Big Bear Valley Groundwater Management Zone	Irrigation

Notes:
1. The Colorado River Basin Regional Water Quality Control Board (Region 7) regulated the use of the recycled water in the Lucerne Valley (WDR Order No. R7-2016-0026).

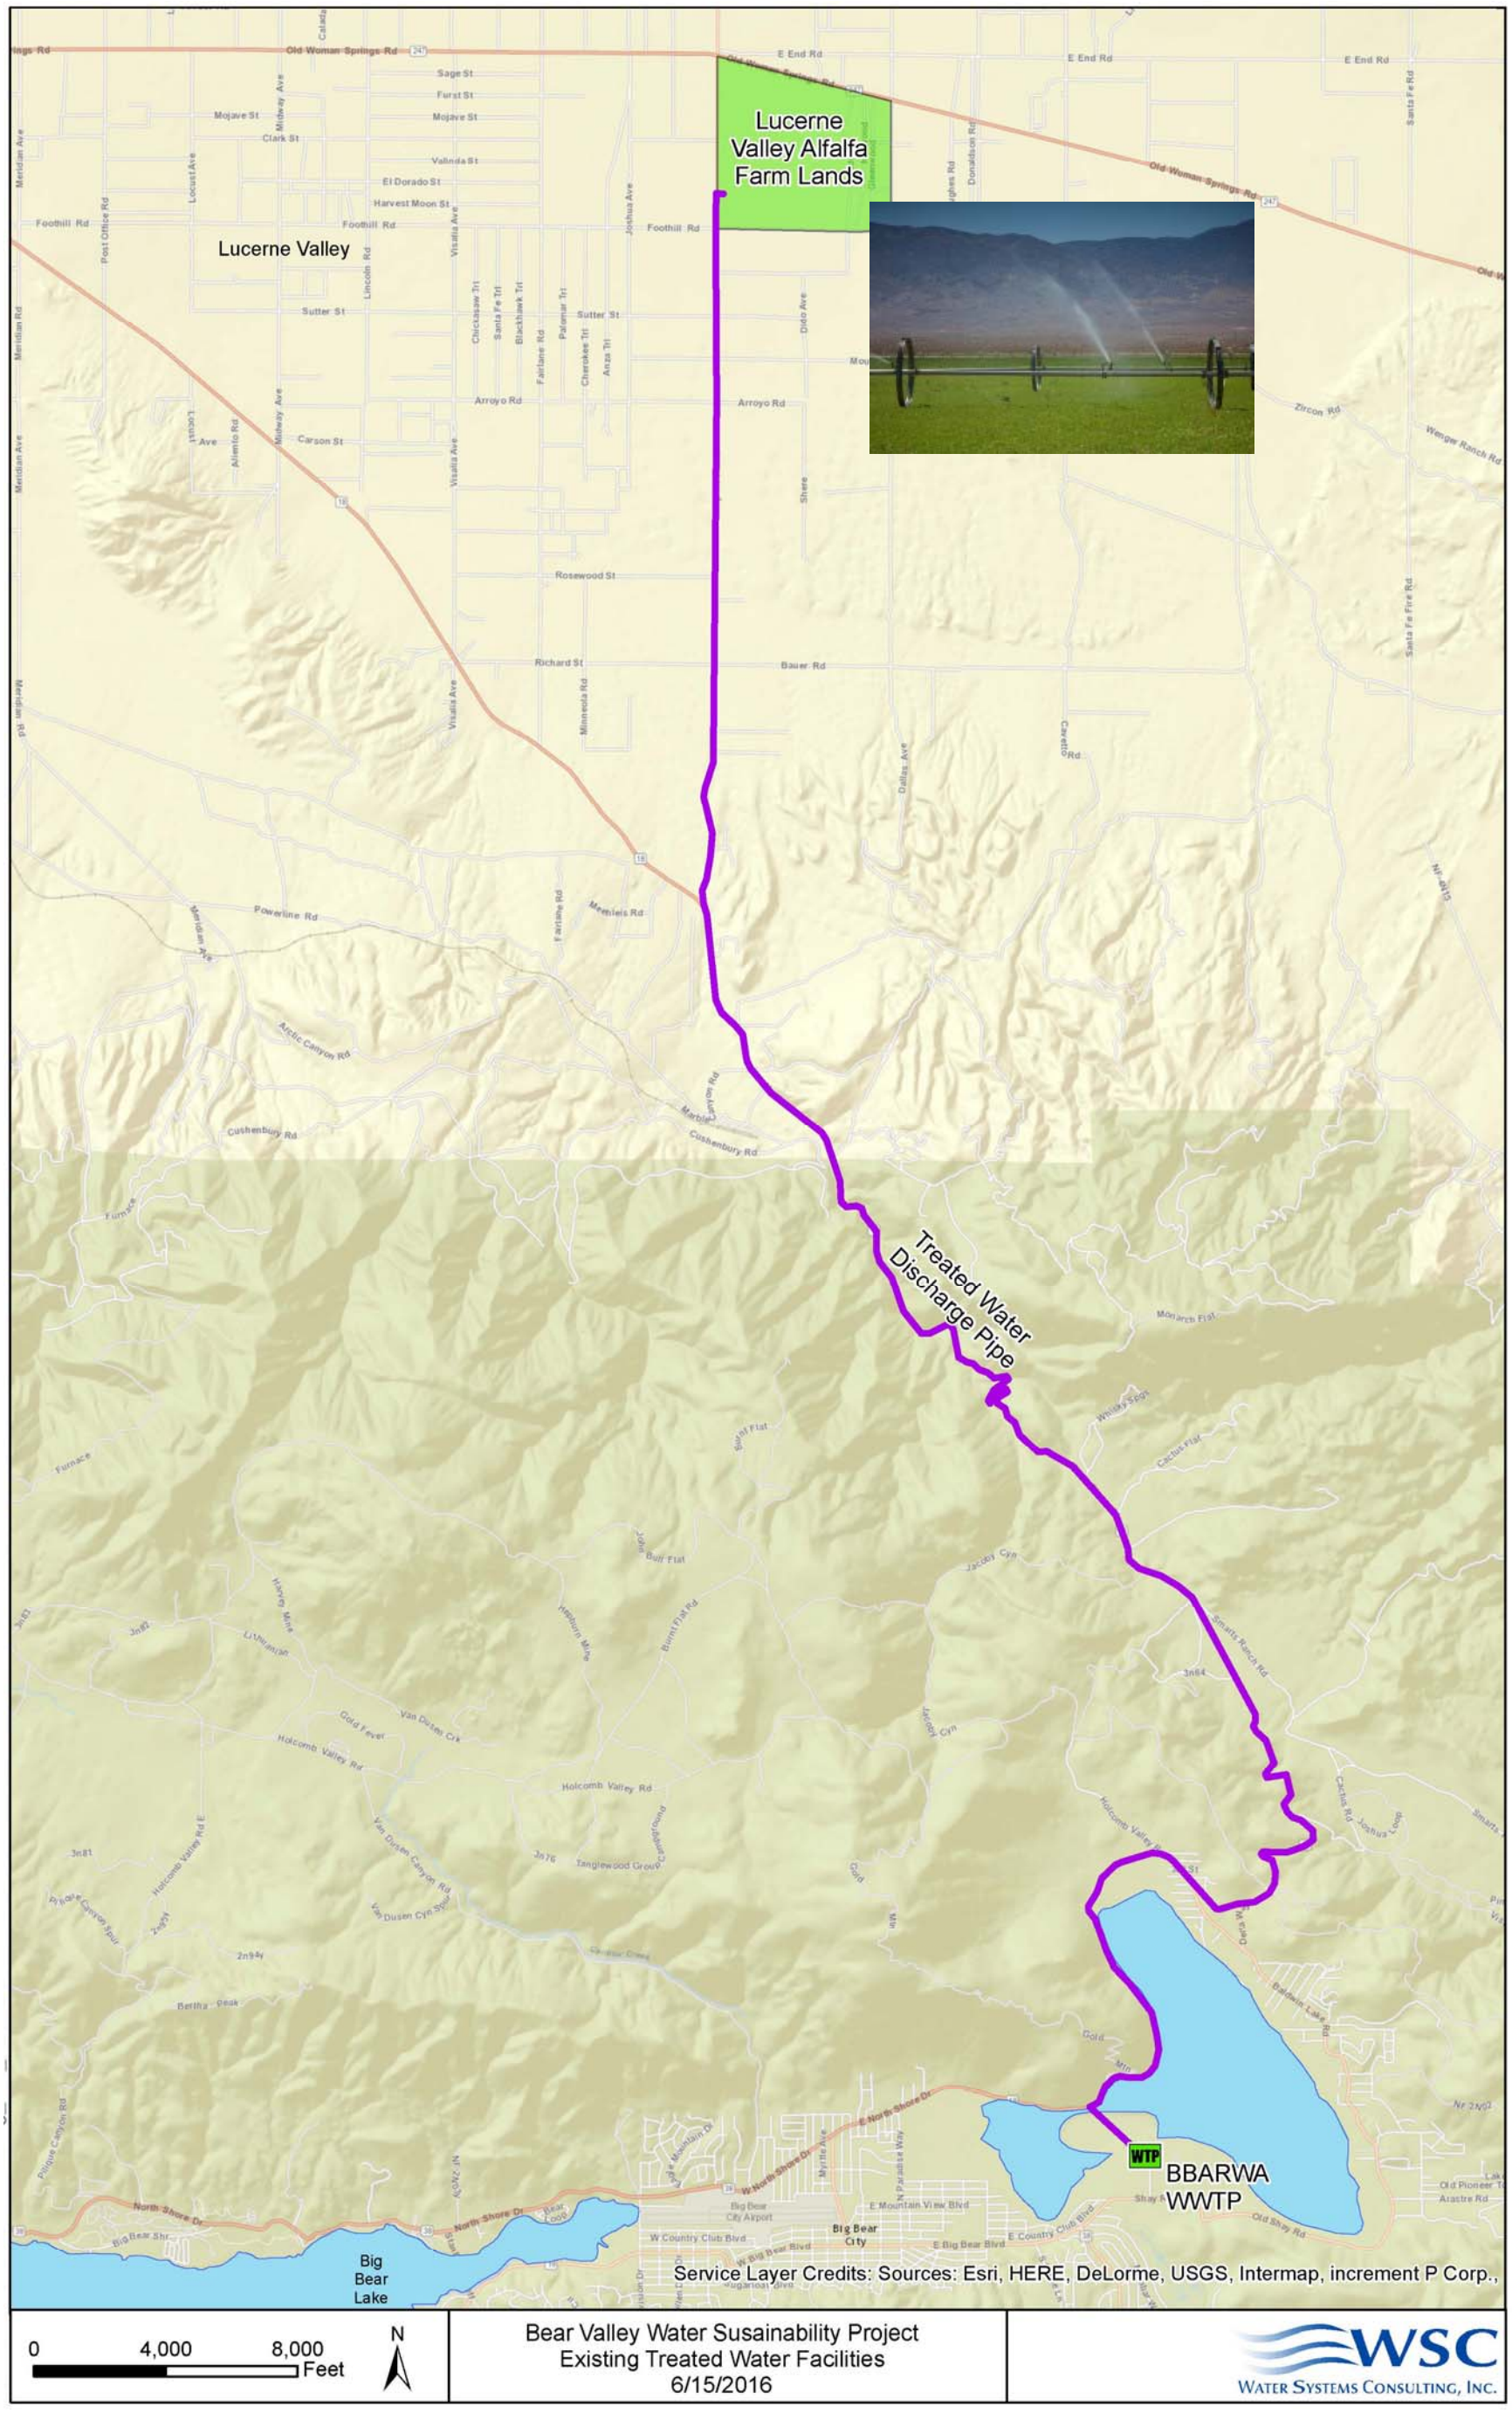

Figure 3-4. Existing Recycled Water Facilities

The effluent requirements for conventional pollutants for recycled water discharged to the LV Site contained within the Colorado WDR are presented in Table 3-3 and a summary of the actual effluent quality in 2015 is presented in Table 3-4.

The previous Colorado WDR that regulated this discharge (Board Order 01-156) included a TDS limit of a maximum of 400 mg/L above the domestic source water. The WWTP discharge was always well within compliance with this requirement. The recently updated WDR requires BBARWA to provide a technical report in the form of a study that analyzes the impacts to groundwater in the vicinity of the LV Site by the discharge and an evaluation of water quality trends. The results of the study will be used to establish an appropriate effluent limitation for TDS. BBARWA has begun the preparation of this report, which is required to be submitted by December 30, 2017 (18 months of the adoption of the Colorado WDR). Based on the background water quality in the vicinity of the LV Site and discussions with the Colorado River Basin RWQCB, it is not anticipated that the results of this study will lead to the establishment of a TDS limit lower than the current effluent TDS level. Therefore, additional treatment upgrades are not anticipated to be required to comply with this provision.

A copy of the two WDR permits are attached in Appendix A.

Table 3-3. Discharge Limits for LV Site and Actual 2015 Effluent Quality

Parameter	Units	30-Day Mean	7-Day Mean	Maximum Daily
Biochemical Oxygen Demand (BOD_5)	mg/L	30	45	-
Total Suspended Solids (TSS)	mg/L	30	45	-
Chloride	mg/L	60	-	80
Sulfate	mg/L	60	-	80
Boron	mg/L	-	-	0.75
Total Nitrogen	mg/L	10	-	-
pH	pH units	Between 6.0 - 9.0 at all times		

Table 3-4. 2015 BBARWA WWTP Effluent Quality – Annual Average

Parameter	Value	Units
TDS	453	mg/L
BOD_5	6	mg/L
TSS	13	mg/L
Chloride	56	mg/L
Sulfate	43	mg/L
Phosphorus	2.3	mg/L
Total Inorganic Nitrogen (TIN)	4.6	mg/L
pH	7.12 – 8.09	pH units

3.2.2 BBARWA Operating Budget

BBARWA's operating budget for Fiscal Year (FY) 2017 is shown in Table 3-5.

Table 3-5. BBARWA FY 2017 Operating Budget (12)

Expense Category	Budget FY 2017
Salaries and Benefits	$ 1,933,443
Power	$ 531,528
Sludge Removal	$ 258,910
Chemicals	$ 43,816
Materials and Supplies	$ 139,421
Repairs and Replacements	$ 141,680
Equipment Rental	$ 770
Utilities Expense	$ 6,337
Communications Expense	$ 42,084
Contractual Services - Other	$ 100,340
Contractual Services - Prof	$ 211,272
Permits and fees	$ 149,100
Property Tax Expense	$ 3,705
Insurance	$ 90,931
Other Operating Expense	$ 58,578
Depreciation Expense	$ 841,470
Total Operating Expense	**$ 4,553,385**

3.2.3 Current Rate Schedule

BBARWA's current rate schedule is shown in Table 3-6.

Table 3-6 BBARWA Rate Schedule (12)

Member Agency	Charge per EDU
City of Big Bear Lake	$206.37
Big Bear City CSD	$197.35
CSA 53B	$192.48
Connection Fee[1]	$3,670

Notes:

1. Effective July 1, 2016

3.2.4 Capital Improvement Plan

BBARWA's 5-year Capital Improvement Plan for Fiscal Years 2017-2021 is shown in Table 3-7.

Table 3-7 BBARWA 5-year Capital Improvement Plan (12)

Primary Account	Budget FY 2017	Forecast FY 2018	Forecast FY 2019	Forecast FY 2020	Forecast FY 2021	5-Year FY 2017-2021
Administration Building	$5,000	$0	$0	$0	$0	$5,000
Flow Measuring Devices	$19,271	$26,497	$0	$48,031	$0	$93,799
Interceptor System	$0	$0	$411,334	$579,637	$0	$990,971
Other Equipment	$26,408	$33,623	$34,343	$138,175	$6,708	$239,257
Other Capital Assets	$0	$0	$14,578	$0	$0	$14,578

Transportation Equipment	$77,800	$0	$0	$93,903	$64,706	$236,409
Treatment Plant	$114,126	$292,272	$1,751,791	$1,644,175	$257,105	$4,059,469
Total	**$242,605**	**$461,665**	**$2,212,046**	**$2,610,240**	**$638,495**	**$6,165,051**

3.3 TREATMENT REQUIREMENTS

In order to recharge the groundwater basin or discharge recycled water to the Lake, the recycled water must meet the water quality objectives set by the Basin Plan. The Basin Plan establishes beneficial uses and water quality standards for the ground and surface waters of the region and includes an implementation plan describing the actions by the RWQCB and others that are necessary to achieve and protect the water quality standards. The Basin Plan provides a general narrative regarding the water quality objectives for each water body type and specific numeric objectives for total dissolved solids (TDS), hardness, sodium, chloride, total inorganic nitrogen (TIN), sulfate, and chemical oxygen demand (COD). Additional information about the Basin plan is provided in Appendix B. The water quality objectives for the Big Bear Valley are summarized in Table 3-8.

Table 3-8. Basin Plan Water Quality Objectives

Water Body	TDS	Hardness	Sodium	Chloride	TIN	Sulfate	COD
Inland Surface Streams							
Rathbone Creek	300	-	-	-	-	-	-
Lakes and Reservoirs							
Big Bear Lake	175	125	20	10	0.15	10	-
Wetlands (Inland)							
Stanfield Marsh (Narrative Objectives)	-	-	-	-	-	-	-
Groundwater Management Zones							
Big Bear Valley	300	225	20	10	5	20	-

3.3.1 Recycled Water Treatment Level for Groundwater Recharge

A key consideration in the development of any recycled water project is the required quality and treatment level of the recycled water as established by State Regulations. There are several factors that can drive that determination for each project. For groundwater recharge projects, the primary factors influencing level of treatment are: (1) availability of high quality dilution water in the vicinity of the recharge area; and (2) whether additional treatment is required to meet the Basin Plan Objectives for TDS for the proposed beneficial use location. Either factor can be the driver for the required treatment level, depending on the specifics of a particular project. These considerations for treatment level decisions are depicted in Figure 3-5.

The groundwater replenishment regulations in Title 22 require that the initial concentration of filtered and disinfected tertiary recycled water (Recycled Water Concentration or RWC) not exceed 20% of the total recharge water, which requires 80% of the total recharge water to come from other high quality water sources for blending. Blend water can be a combination of imported SWP water, captured stormwater, or natural underflow. If sufficient dilution water is not available from these sources, advanced purified recycled water using reverse osmosis (RO) and advanced oxidation can serve as a dilution source.

According to the Basin Plan, if the current quality of a management zone is the same as or poorer than the specified water quality objectives, then that management zone does not have assimilative capacity. If the current quality is better than the specified water quality objectives, then that management zone has assimilative capacity. If there is assimilative capacity in the receiving waters for TDS, nitrogen or other constituents, a recycled water discharge may be of poorer quality than the objectives for those constituents, as long as the discharge does not cause violation of the objectives and provided that antidegradation requirements are met. However, if there is no assimilative capacity in the receiving waters, the recycled water quality cannot be poorer than the receiving water objectives and may require additional treatment. Alternatively, the Basin Plan can be amended to specify "maximum benefit" water quality objectives, which create assimilative capacity, subject to approval by the Santa Ana RWQCB and the implementation of certain projects and actions by the responsible agencies. The assimilative capacity of the Big Bear Valley Groundwater Management Zone has not yet been evaluated. Assimilative capacity can be evaluated on a project specific basis or for the basin as whole through the Santa Ana Watershed Project Authority Basin Monitoring Program Task Force (BMPTF).

Advanced treatment that uses a RO process can be used to achieve both dilution requirements and TDS removal. Additional information on the regulations related to these considerations is provided in Appendix B.

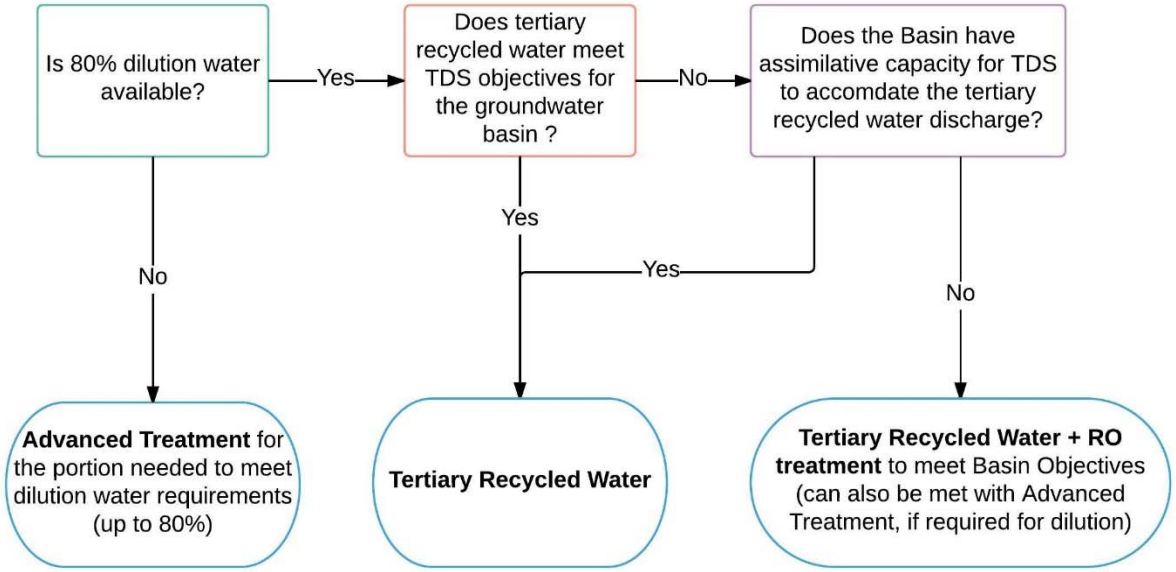

Figure 3-5. Treatment Level Considerations

At the planning level, there is some uncertainty in the treatment requirements because the available dilution water has often not been fully quantified and the ability to use assimilative capacity, if available, has not been determined. Project proponents have an opportunity to perform additional analysis to demonstrate to the RWQCB and DDW that tertiary treatment and dilution water will meet the Title 22 and Basin Plan requirements. The RWQCB and DDW will make the final decisions on the required treatment levels after review and evaluation of technical information presented by the project proponent during the permitting process.

4 RECYCLED WATER MARKET AND OPPORTUNITIES

4.1 PRIOR MARKET ANALYSIS

There is a long legacy of exploring water reuse opportunities in the Big Bear Valley for a variety of beneficial uses including wildlife habitat, landscape irrigation, surface water discharge, and groundwater recharge. Water reuse opportunities in the Valley were first investigated in 1964 and evaluations have continued intermittently since BBARWA was formed in 1974.

Appendix C includes a timeline summarizing the evolution of wastewater management in the Valley from 1935 to 2003 as well as a partial list of documents related to water reuse in the Valley, as of April 2005.

The most recent effort to develop a recycled water program in the Valley culminated with the development of the BBARWA Recycled Water Master Plan (RWMP), which was completed in 2006, and the Program Environmental Impact Report (PEIR), which examined the alternatives, put forth in the RWMP.

The 2006 RWMP evaluated several recycled water opportunities:

- Non-potable reuse for irrigation, industrial, commercial, and construction use;
- Environmental uses; and
- Groundwater recharge through surface recharge basins.

The RWMP recommended a phased implementation of a recycled water program that included both non-potable reuse and groundwater recharge at the Greenspot Recharge Site in the Erwin Lake area. Phase 1 included only groundwater recharge at the Greenspot Recharge Site. A recycled water distribution system to non-potable users was recommended for subsequent phases once assurances were obtained from potential recycled water users who would be connected.

Ultimately, the BBARWA Board certified the PEIR in 2006 and received and filed the RWMP, but decided not to approve the implementation of a recycled water project at that time.

4.2 MARKET ANALYSIS UPDATE

This Study updated the market analysis performed in the 2006 RWMP and evaluated opportunities for additional types of reuse. The types of reuse considered in this Study include:

- Landscape Irrigation
- Fish Hatchery Supply
- Surface Water Discharge
- Groundwater Recharge – Inland injection and/or surface spreading
- Direct Potable Reuse, pending future regulations

4.2.1 Landscape Irrigation

An initial list of 55 potential recycled water users in the Big Bear Valley was compiled from the users listed in the 2006 RWMP, as well as additional users identified by the Project Team. At the Alternatives Development Workshop for this Study, the Project Team reviewed this list and eliminated some potential users that: are no longer in existence or did not develop as expected; are anticipated to be closed in the near future; have low water demands; or are expected to be unwilling to convert to recycled water.

The final list of 25 potential recycled water users considered in the Study. For each user, consumption records from 2011-2014 were obtained from that user's water supplier, either BBLDWP or BBCCSD. The average of the annual consumption between 2011 and 2014 was used as the estimated recycled water demand. Where consumption records were not available, estimated demands from other studies were used. The list of potential recycled water users is shown in Table 4-1 and on Figure 4-1. Appendix D includes the sources of data used to estimate demands for each user, as well as estimates of maximum day demand and peak hour demand for each.

Table 4-1. Potential Recycled Water Users and Demands

User ID	Potential Recycled Water User	Total Annual Demand (AFY)
1	North Shore Elementary School	8.6
2	Rotary Pine Knot Park	2.6
3	Veterans Park	2.3
4	Meadow Park	0.9
5	Big Bear Middle School	12.6
6	Big Bear Elementary School	5.1
7	Big Bear Snow Play	0.1
8	City of Big Bear Lake City Hall and Village Streetscape	0.6
9	World Mark (Timeshare Resort)	20.6
10	Big Bear High School	22.2
11	Stickleback	37.8
14	Big Bear Airport District (Landscaping Meter)	0.6
15	Church of Jesus Christ Latter Day Saints	1.8
16	Erwin Lake Park	1.6
17	Gold Mountain Memorial Park (Cemetery)	0.0
22	Sonny's Place Equestrian Center	0.0
23	Whispering Pines	8.3
25	Chautauqua High School B	2.1
27	Paradise Park (Proposed)	3.0
28	Big Bear Golf Course	120.0
30	The Ranch	1.6
31	Alpine Zoo	1.5
33	Baldwin Lake Elementary	7.7
34	Sugarloaf Park	22.0
35	Otto Lawrence (Inn Der Bach)	0.5
	Total	284.3

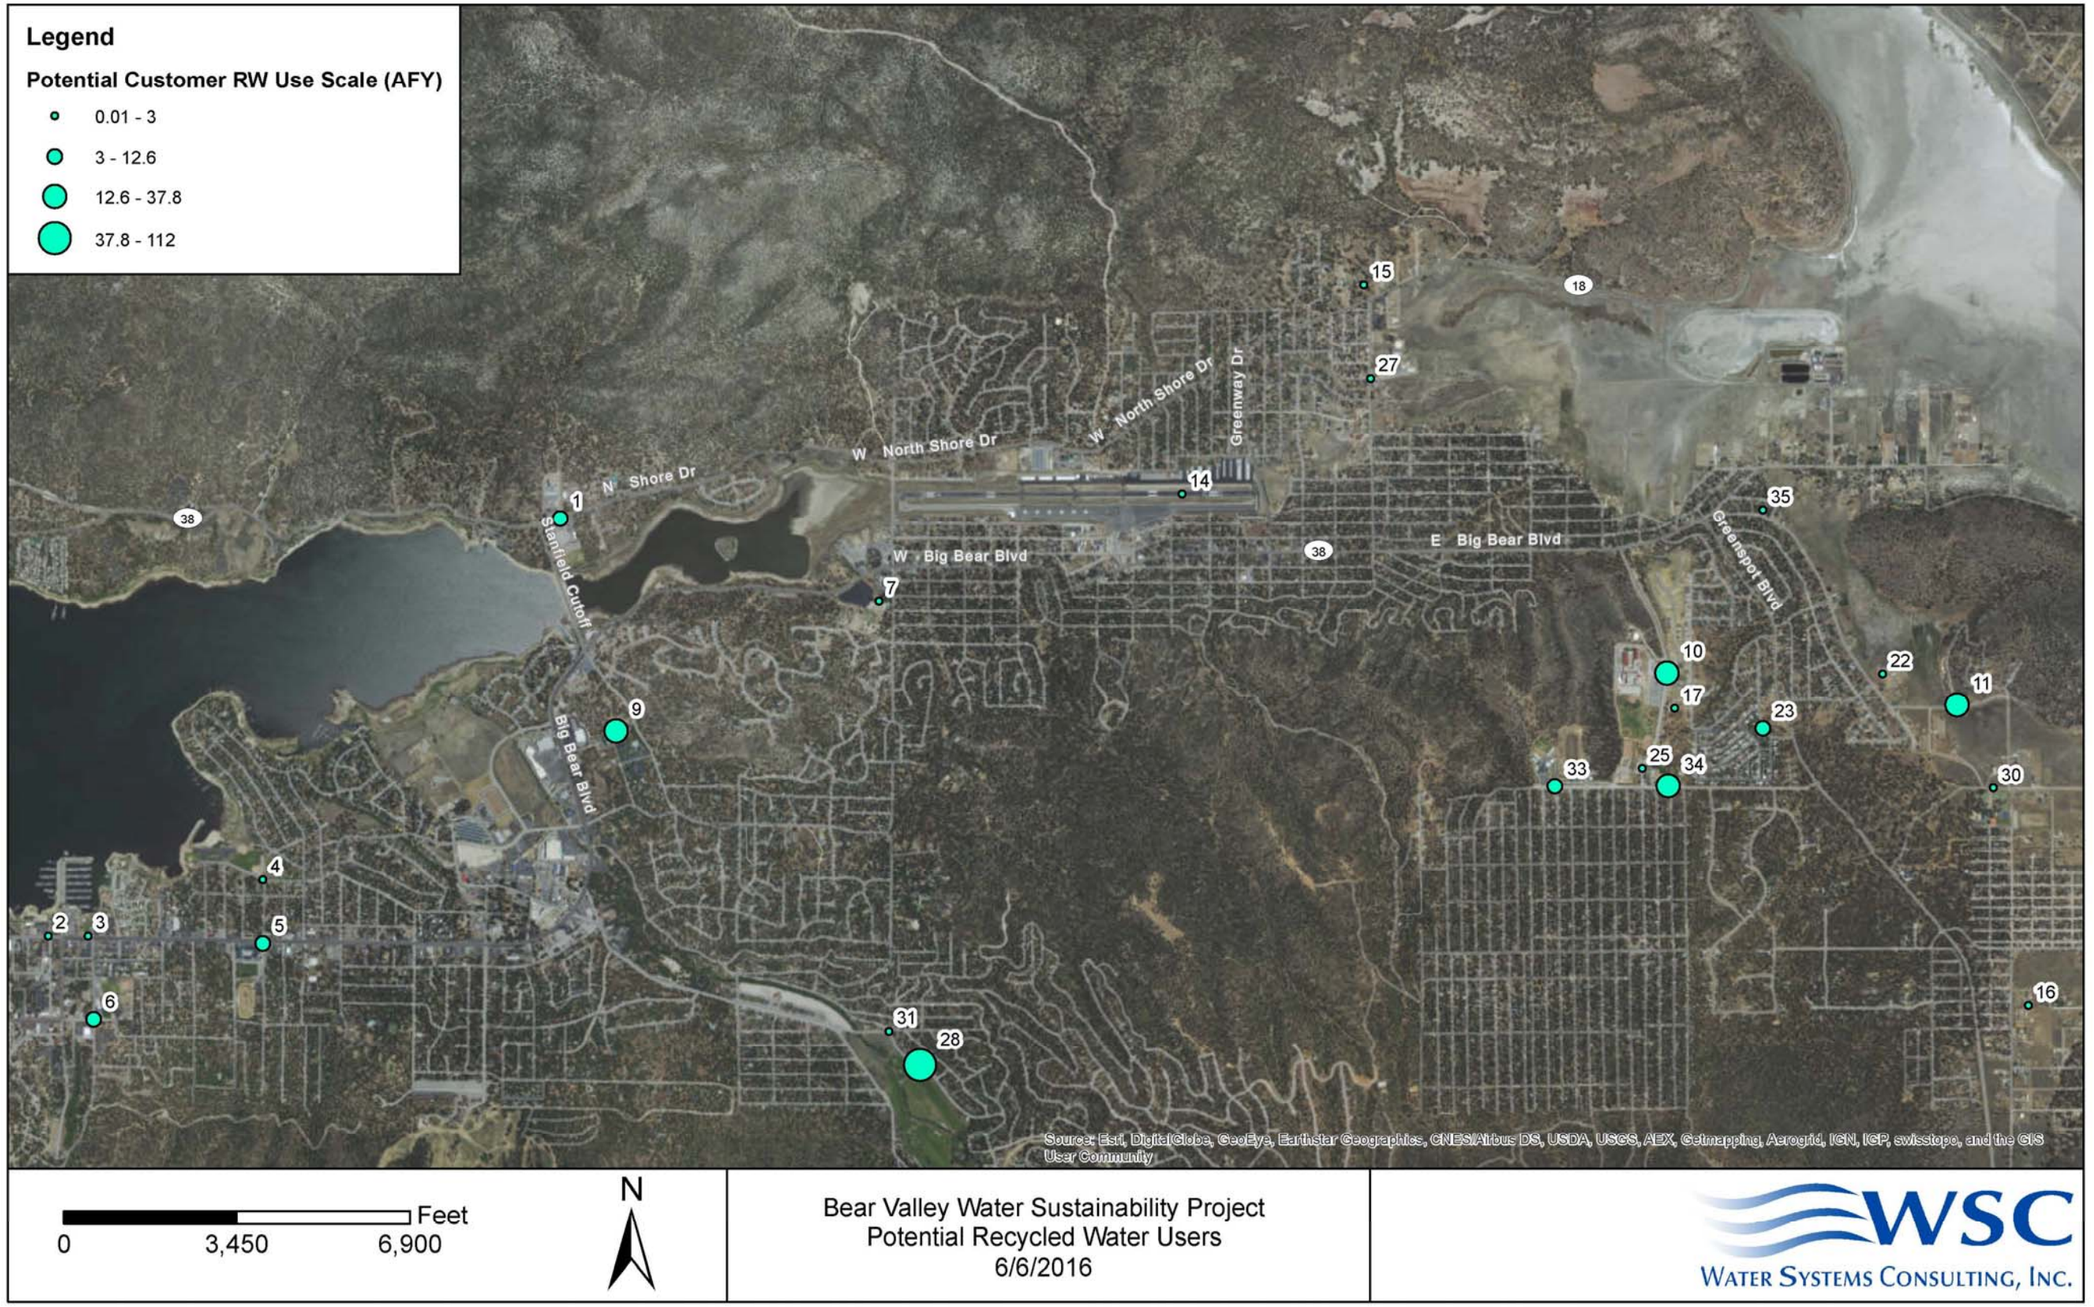

Figure 4-1. Potential Recycled Water Users

4.2.2 Fish Hatchery

One of the goals of this Study was to explore the viability of developing a fish hatchery to provide community benefits and potentially offset the costs of a project that provides a new and sustainable source of water to the Valley.

A Technical Memorandum (TM) describing a conceptual recirculating hatchery at the BBARWA WWTP site is included in Appendix I. This TM summarizes the research compiled, sources gathered, and calculations conducted regarding the fish hatchery and treatment wetlands concepts. The TM assumed the hatchery would be sized to produce 150,000 pounds of trout per year to meet the local demand for stocking the Lake. The effluent from the hatchery is assumed to be treated using a constructed wetlands system to reduce ammonia concentrations and total suspended solids and recycled water from the BBARWA plant would be provided as makeup water. A conceptual process flow diagram for the hatchery and wetlands treatment concept is shown in Figure 4-2. Additional details are provided in Appendix I.

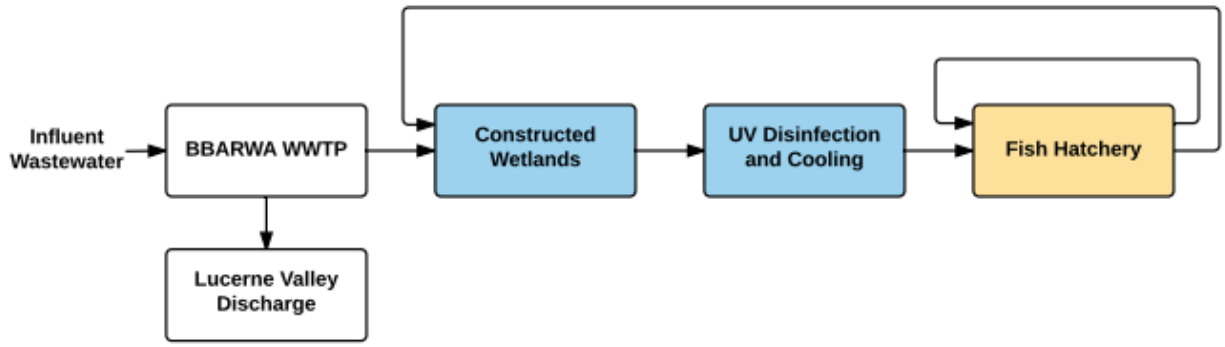

Figure 4-2. Conceptual Hatchery Process Flow Diagram

A concept level opinion of preliminary cost was developed to provide an order of magnitude estimate for the hatchery and wetlands treatment concept to help guide decisions on next steps for this concept. The preliminary estimate of annual unit cost is in the range of $8 - $12 per pound of fish, which is higher than BBMWD typically pays for fish from other sources, although supply from these sources is often limited.

Although impoundments at fish hatcheries are identified as an acceptable use of recycled water in Title 22, no examples of hatcheries using recycled water as a supply were identified. There are several potential environmental and regulatory hurdles to implementing a fish hatchery with a recycled water supply.

The Project Team has decided not to pursue implementation of a fish hatchery at the BBARWA WWTP site using a recycled water supply at this time. However, the alternatives analysis in Chapter 5 identifies potential opportunities to integrate a hatchery with the water supply alternatives.

4.2.3 Groundwater Recharge – Surface Spreading

The potential to supplement supply in the Big Bear Valley with recycled water using surface recharge facilities was previously evaluated by GEOSCIENCE Support Services, Inc. (GEOSCIENCE) in a 2004 Recharge Evaluation (13), as well as in prior studies. In the 2004 Recharge Evaluation, four sites were initially identified for investigation of artificial recharge potential:

- The area north of Green Spot Spring (Erwin Subunit; Eastern Baldwin Lake Watershed),
- Van Dusen Canyon (West Baldwin Subunit; Western Baldwin Lake Watershed),
- Shay Meadow Area (Erwin Subunit; central Baldwin Lake Watershed), and
- Sand Canyon (Rathbone Subunit; Eastern Big Bear Lake Watershed).

Figure 4-3 shows the potential recharge locations that were evaluated. After a preliminary evaluation of site access and environmental issues, preliminary investigations and borehole drilling, regulatory requirements, and pilot testing, the Shay Meadow and Sand Canyon sites were removed from consideration before any additional field investigations were conducted. The Green Spot Spring and Van Dusen Canyon sites were the subjects of further drilling and testing. Although not fully evaluated in the 2004 GEOSCIENCE study, the Sand Canyon recharge is included in this Study and is discussed in Section 4.2.3.4.

4.2.3.1 *Greenspot Recharge Site*

Analysis of the drilling and pilot recharge testing at the Greenspot site resulted in the following conclusions (13):

- The Greenspot site is located on recent alluvial deposits of permeable sand and gravel and no soil layers were observed beneath the site that would inhibit the downward percolation of recharge water to the ground water table.
- Groundwater levels start at approximately 100 ft below ground surface (bgs), which allows adequate space for mounding and storage of recharge water.
- A one-month pilot recharge test resulted in recharge rates of 3.1 to 3.7 ft/day. For planning purposes, the recharge rate is assumed to be one half of the observed rate to be conservative.
- At the seepage velocities estimated from the artificial recharge test data, ground water recharged at the Green Spot Site would reach the nearest production wells (BBLDWP's Lakewood well field) in 8.5 to 17.5 months.
- No fatal flaws were identified during the pilot recharge test.
- The property necessary to support a full-scale program at this site should include more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access.

In a subsequent study by GEOSCIENCE in 2005 titled *Analysis of Ground Water Flow Model Simulations for the Proposed Green Spot Artificial Recharge Site*, a calibrated groundwater flow model was used to simulate and evaluate a full-scale artificial recharge spreading basin facility at this site. The study evaluated potential changes in groundwater levels that would result from the artificial recharge of 500, 1,000, 1,500 or 2,000 AFY of water, with and without additional groundwater pumping. The study concluded that:

- An additional extraction well field downgradient of the recharge site would be needed to effectively intercept the water that is artificially recharged at the Greenspot Recharge Site. The study assumed 6 extraction wells at a rate of 100 gallons per minute (gpm) each.
- Groundwater levels can be maintained below approximately 30 ft bgs with as much as 1,000 AFY of artificial recharge during periods of below normal precipitation, provided that an equivalent amount of water is extracted at the down gradient well field.
- During wet periods, further pumping from the extraction well field and Lakewood Wells is required to artificially lower the ground water levels to maintain storage space within the aquifer in order to continue artificial recharge.
- DWR records suggest that some existing private wells are located in the vicinity of the proposed recharge basins and would be within 6-months travel time from the proposed basins. However, the exact locations of these wells will have to be verified.

4.2.3.2 *Van Dusen Site*

Analysis of the drilling and pilot recharge testing at the Van Dusen site resulted in the following conclusions (13):

- The Van Dusen site is located on recent alluvial deposits of permeable sand and gravel. Some soil layers were observed beneath the site that may inhibit the downward percolation of recharge water to the groundwater table.
- Groundwater levels start at approximately 100 ft bgs, which allows adequate space for mounding and storage of recharge water.
- A one-month pilot recharge test resulted in recharge rates of 1.1 to 1.6 ft/day. For planning purposes, the recharge rate is assumed to be one half of the observed rate to be conservative.
- At the seepage velocities estimated from the artificial recharge test data, ground water recharged at the Van Dusen Canyon site would reach the nearest production well (BBCCSD Well No. 1) in approximately 106 to 160 months.
- No fatal flaws were identified during the pilot recharge test.

Given the lower recharge rates and limited availability of property, this site is not as favorable as the Green Spot Site (13). The Van Dusen Site was not considered in this Study.

4.2.3.3 *Shay Meadow Area*

The Shay Meadow site was not considered viable due to shallow ground water and environmental concerns (13) and was not considered in this Study.

4.2.3.4 *Sand Canyon Site*

From a geohydrologic perspective, the Sand Canyon area is very promising for artificial recharge. Sediments above the ground water consist primarily of permeable sand and the ground water surface is greater than 100 ft bgs. However, Sand Canyon was removed from consideration prior to further testing due to its distance from BBARWA, site access constraints, and regulatory issues (13). Although coordination with the flood control agency increases the complexity of project implementation, the Sand Canyon Site was included in this Study due to the significant recharge potential and proximity to BBLDWP's primary production facilities. A conceptual satellite treatment facility was evaluated as an alternative to produce a recycled water supply closer to this site.

A report prepared for BBLDWP in 1991 estimated that the long term percolation rate for the Sand Canyon stream channel is between 1.5 and 4.5 ft/day, but recommended using the minimum value of 1.5 ft/day to be conservative (14). The report estimated that approximately 750 AFY of recycled water could be recharged at Sand Canyon while meeting the minimum travel time requirement before extraction at downstream wells. Travel time and blending requirements were the limiting criteria for this analysis and the actual recharge potential may be greater. The study assumes that a series of small berms 4 ft in height would be constructed along the Sand Canyon streambed above Teton Drive with a total area of approximately 2.5 acres. As this is a flood control channel, the berms would need to be designed to allow the conveyance of flood flows through the channel and may need to be designed to wash out during large flood events.

An alternative approach later identified by BBLDWP is to modify the stream channel to slow down the flow of water to allow maximum percolation but not interfere with flood flows. This concept could include widening the stream to the extent possible to create a meandering stream with small natural ponds to slow the water down and enhance percolation. Either concept would need to be coordinated with the flood control agency to ensure that the capacity of the flood control channel remains sufficient to meet the primary purpose of providing flood protection. If these improvements resulted in a decrease in surface flow entering the Lake, the impact to surface water rights under the 1977 Judgment would need to be evaluated.

4.2.3.5 *Stanfield Marsh*

In addition to the sites identified in the 2004 Recharge Evaluation, the Project Team considered the concept of discharging recycled water to a drainage channel that parallels the south side of the Big Bear Airport and discharges into the Stanfield Marsh, which is tributary to the Lake. However, according to the 1998 BBARWA Engineer's Report, the Stanfield Marsh has a significant clay later on the bottom of the marsh that prevents percolation into the surrounding groundwater basin (15). The report states that BBLDWP has wells that are less than 1000 ft from the marsh high water level and studies by BBLDWP have shown that the wells do not receive replenishment groundwater from the marsh. The report does not include the details on the underlying geology and the referenced studies were not found for review; however, this indicates that recharge at Stanfield Marsh is not a viable site for replenishment of the groundwater supply.

Additionally, since the Stanfield Marsh is hydraulically connected to the Lake, discharges to the Stanfield Marsh would likely be required to meet water quality objectives of the Lake. The TDS objective for the Lake is 175 mg/L, which would require a significant portion of the discharge to receive RO treatment to reduce TDS. Due to the apparent absence of a water supply benefit, the Stanfield Marsh was not considered for recharge as part of this Study. However, further evaluation could be conducted to assess whether recharge in the bottom of the drainage channel along the south side of the airport would recharge the shallow aquifer and provide a water supply benefit.

The Stanfield Marsh and the Lake are designated as Municipal Supply in the Basin Plan. While the water in the Lake is not used locally for municipal supply, discharges from the Lake enter Bear Creek and are collected downstream at the confluence with the Santa Ana River and are ultimately delivered to two drinking water filtration plants that provide municipal supply in the San Bernardino Valley. The 1998 BBARWA Engineer's Report states that retention time for recycled water discharged to the Lake would be in excess of 20 years. Once released from the Lake, water traveling through Bear Creek provides an additional environmental buffer. Due to the magnitude of the environmental buffer, discussions with DDW indicated that discharge of recycled water to the Lake would not be regulated as surface water augmentation.

Although DDW has indicated that discharging of recycled water to the Lake would not be regulated by that agency, a National Pollutant Discharge Elimination System (NPDES) permit issued by the Santa Ana RWQCB would be required for any discharges to waters of the United States (i.e. rivers, lakes, wetlands, and oceans). An NPDES permit may be issued in conjunction with a WDR Order. The NPDES permit will establish numerical limitations on the concentrations of pollutants that can be in the discharge water. The limitations are based on treatment technology capabilities and surface water uses. The water quality objectives for the Lake in the Basin Plan would apply and would therefore require salt removal before discharge into the Lake, and may require treatment for other criteria that apply to the Lake. Since recycled water discharge to the Lake was not tied to a direct water supply benefit, this alternative was not evaluated in this Study.

The 2004 Recharge Evaluation noted that other sites that have not been previously considered for artificial recharge applications may exist in the Valley, but would require further studies to identify and test.

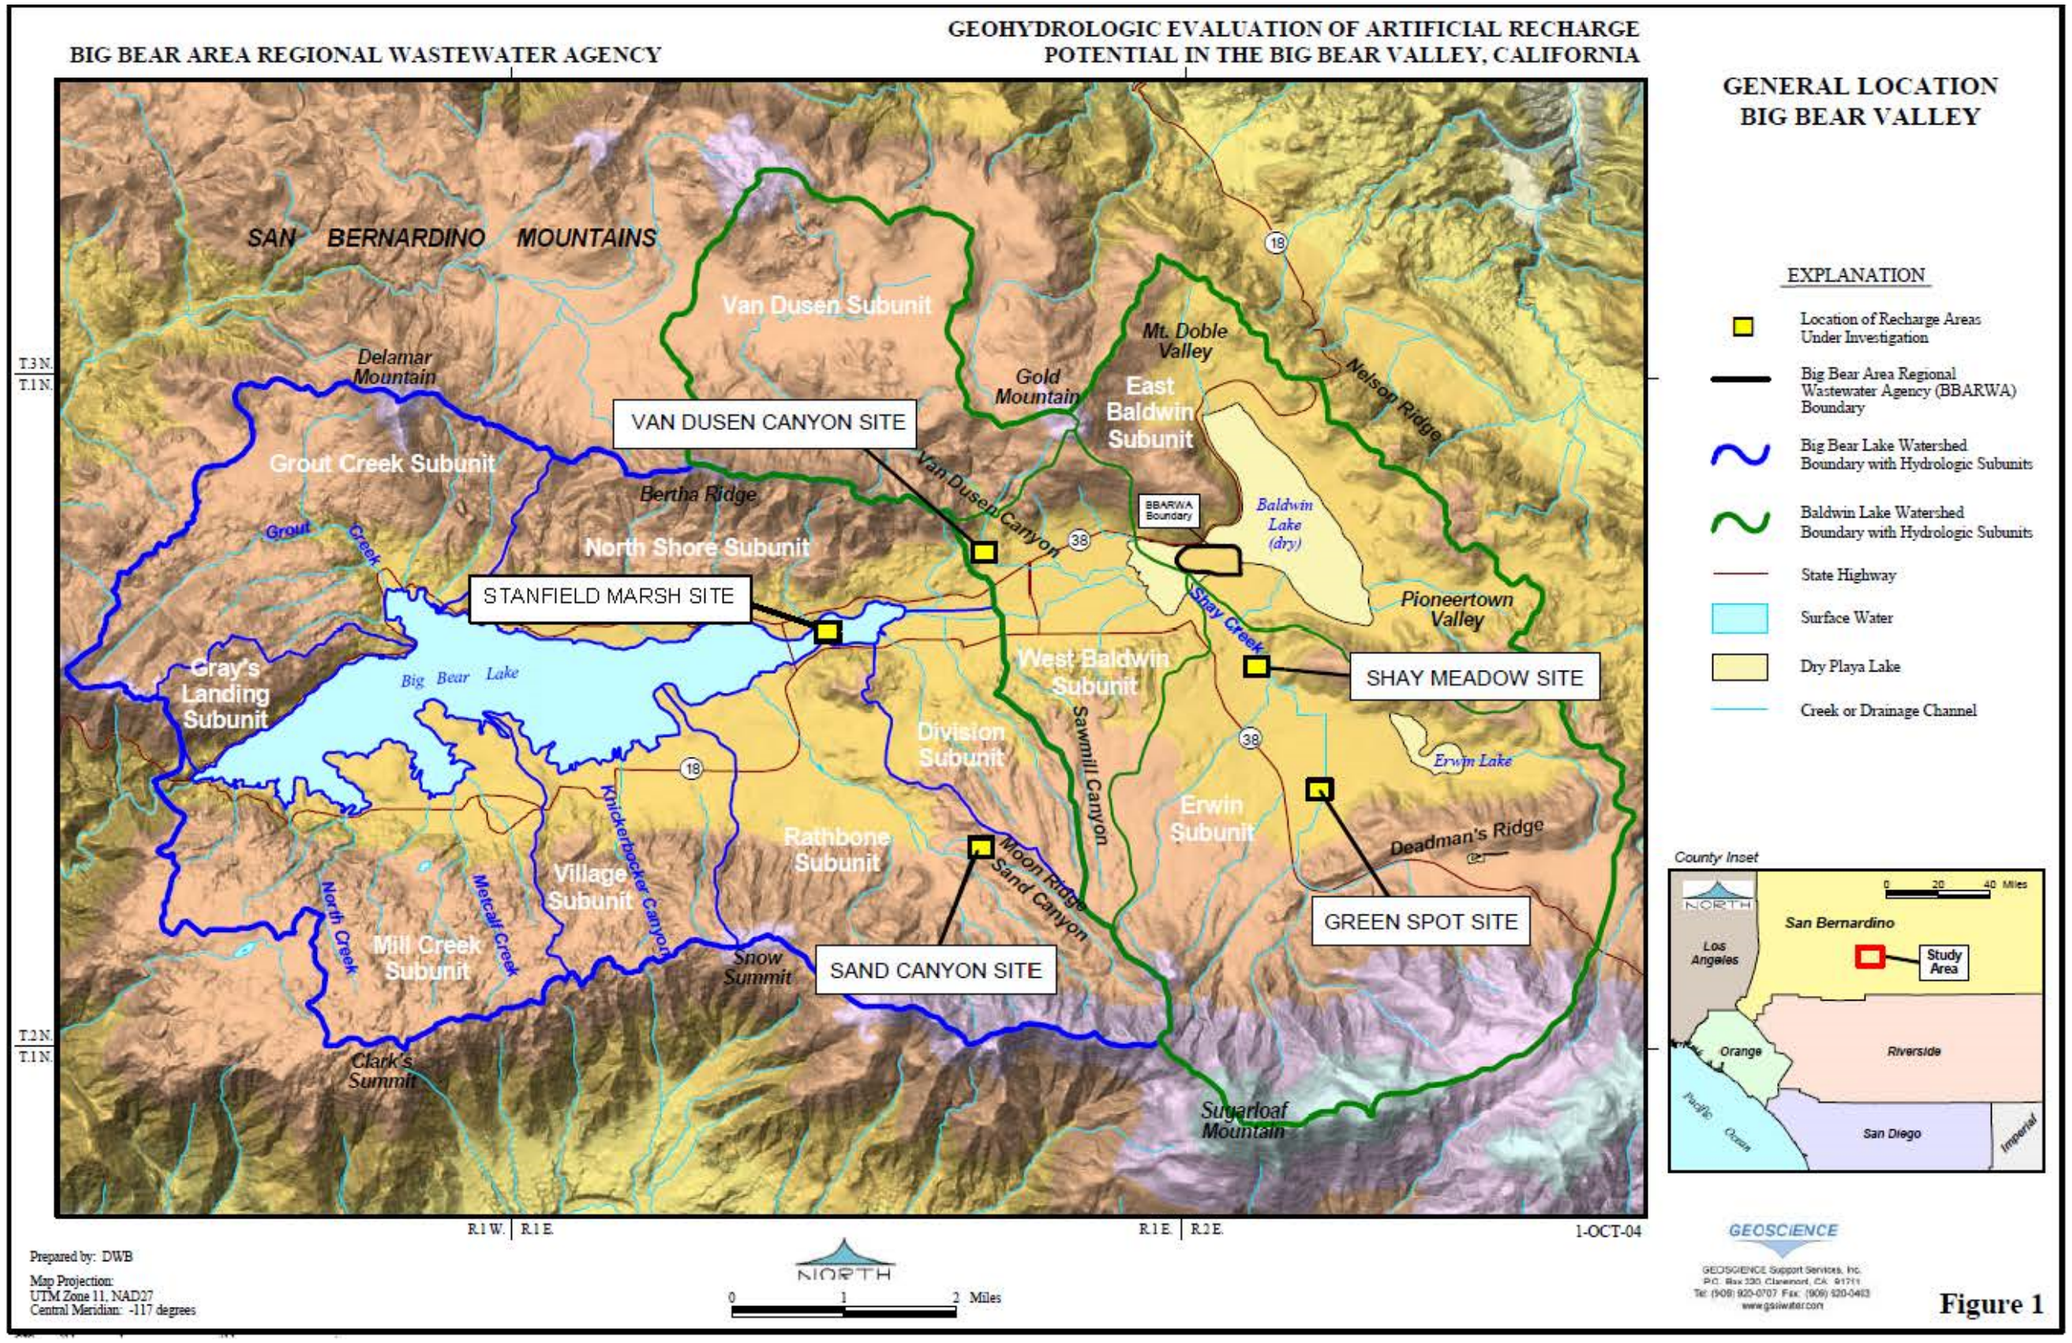

Figure 4-3. Potential Recharge Areas Evaluated (13)

4.2.4 Groundwater Recharge – Subsurface

The Groundwater Recharge Regulations also regulate subsurface recharge via injection wells. Due to the existence of viable surface recharge sites in the Valley and the operational and maintenance requirements of injection wells, the Project Team chose not to evaluate subsurface groundwater recharge in this Study.

4.2.5 Direct Potable Reuse

Direct Potable Reuse involves the use of advanced treatment technologies to purify wastewater for use as municipal drinking water. Recycled water may be introduced into the raw water supply directly upstream of a drinking water treatment facility, or an advanced water treatment facility may be permitted as a drinking water treatment facility and water is the introduced directly into the public water system. Either alternative may require an engineered storage buffer as part of the purification process.

Water agencies in California have begun evaluating the possibility of implementing DPR as a source of local water supply; however, there are currently no regulations for direct potable reuse. Senate Bill (SB) 918 approved on September 30th, 2010 and subsequent SB 322 approved on October 8th, 2014 directed the California Department of Public Health (CDPH), to investigate the feasibility of developing uniform water recycling criteria for DPR (CDPH's responsibilities have since been transferred to the SWRCB's DDW). Additionally, the bills required SWRCB to convene an expert panel for technical and scientific issues, and an advisory group to advise the expert panel and the SWRCB on the development of the feasibility report. The SWRCB will consolidate the information from the expert panel report and provide the findings in a Report to Legislature. A draft Report to Legislature providing recommendations related to the feasibility of developing regulatory criteria for DPR was released for public comment on September 1, 2016, and the final Report to Legislature is due by December 31st, 2016. The expert panel's feasibility report is available as an attachment to the Report to Legislature.

Since there is no surface water treatment plant in the Valley, a potential future DPR project in the Valley may be designed to introduce advanced purified water directly into the potable water system after retention in an engineered water storage buffer. As noted above, DPR is not currently regulated in California but it is recommended that the Bear Valley Agencies continue to track the evolution of recycled water regulations and consider exploring a DPR concept as a long term strategy to increase recycled water use within the Valley.

5 PROJECT ALTERNATIVES ANALYSIS

This section describes the development of the alternatives and the alternatives analysis process used to select the preferred alternative. Appendix E includes a summary of the technical criteria and financial assumptions used for this analysis. Section 6 provides discussion of the following:

- Details of each alternative and the no-project alternative
- Water conservation and reduction analysis
- Alternatives analysis considerations

5.1 ALTERNATIVES EVALUATED

At the Alternatives Development Workshop, the following three recycled water project alternatives were selected for further development and evaluation in this Study:

- Alternative 1: Disinfection Tertiary Landscape Irrigation
- Alternative 2: Groundwater Recharge at Greenspot
- Alternative 3: Groundwater Recharge at Sand Canyon
- Alternative 4: Groundwater Recharge at Greenspot & Sand Canyon

The following subsections provide details of potential use of the recycled water, infrastructure requirements, recycled water unit cost, location, advantages, and disadvantages for each alternative.

5.1.1 Alternative 1: Disinfected Tertiary Landscape Irrigation

Alternative 1 includes upgrading BBARWA's existing WWTP to tertiary treatment for production of Title 22 disinfected tertiary water for landscape irrigation throughout the Valley. Beneficial use of recycled water for disinfected tertiary landscape irrigation is permitted in unrestricted access areas such as school yards, parks and golf courses.

5.1.1.1 *Treatment Upgrades*

To implement Alternative 1, the BBARWA WWTP would need to upgrade to a tertiary treatment process to produce Title 22 disinfected tertiary recycled water (RW). BBARWA's existing secondary treatment and clarification facilities are assumed to be sufficient for adequate BOD and TSS removal prior to tertiary treatment. The new treatment processes required at the BBARWA WWTP to produce disinfected tertiary recycled water include:

- Tertiary filtration. Cloth media filters are assumed as the tertiary filtration process because the technology is offered by multiple vendors, easy to operate and low cost.
- Disinfection. Chlorination is assumed as the disinfection process because the BBARWA staff is familiar with chlorine dosing systems, and chlorination provides adequate disinfection to reliably produce disinfected tertiary RW.

A process flow diagram (PFD) for Alternative 1 is shown in Figure 5-1. The new facilities required for this alternative are outlined in blue. Additional detail on each of the treatment systems is provided in Appendix F.

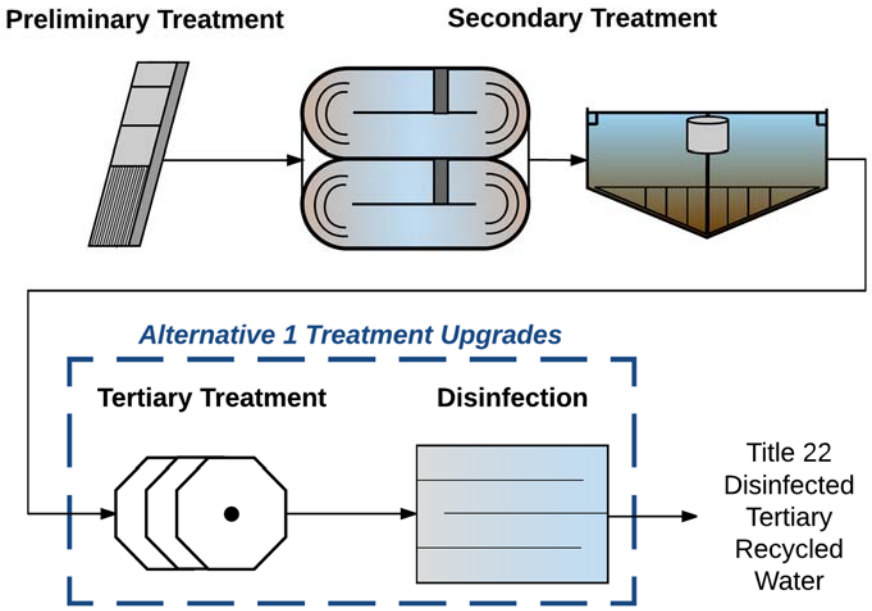

Figure 5-1. Treatment Process Flow Diagram for Alternative 1

5.1.1.2 *Potential Landscape Irrigation in Big Bear Valley*

As described in Section 4.2.1, 25 potential recycled water users were identified. These users can be served with disinfected tertiary recycled water for landscape irrigation. Conceptual pipeline alignments were developed to deliver recycled water to the largest users throughout the valley, while serving other, smaller RW users along the way. Potential users which were not in proximity to the pipeline alignments were assumed not to be served with recycled water. The potential users with the largest estimated annual demand include the WorldMark (20.6 AFY), Sugarloaf Park (22 AFY), Big Bear Middle School (12.6 AFY), Big Bear High School (22.2 AFY) and Big Bear Golf Course (120 AFY). Big Bear Golf Course currently pumps from private wells and may be unwilling to convert to recycled water due to the cost of recycled water conversion and service. Additionally, the Big Bear Valley agencies have indicated the WorldMark timeshare resort is removing turf and their future RW demand may be significantly lower than currently estimated.

Alternative 1 is broken down into seven incremental segments numbered 1.1 to 1.6. Segment 1.1 represents a complete and independent portion of the recycled water system, extending south of the WWTP to serve potential customers in the community of Sugarloaf. The remaining segments 1.2 to 1.6 extend west from the WWTP as shown in Figure 5-2.

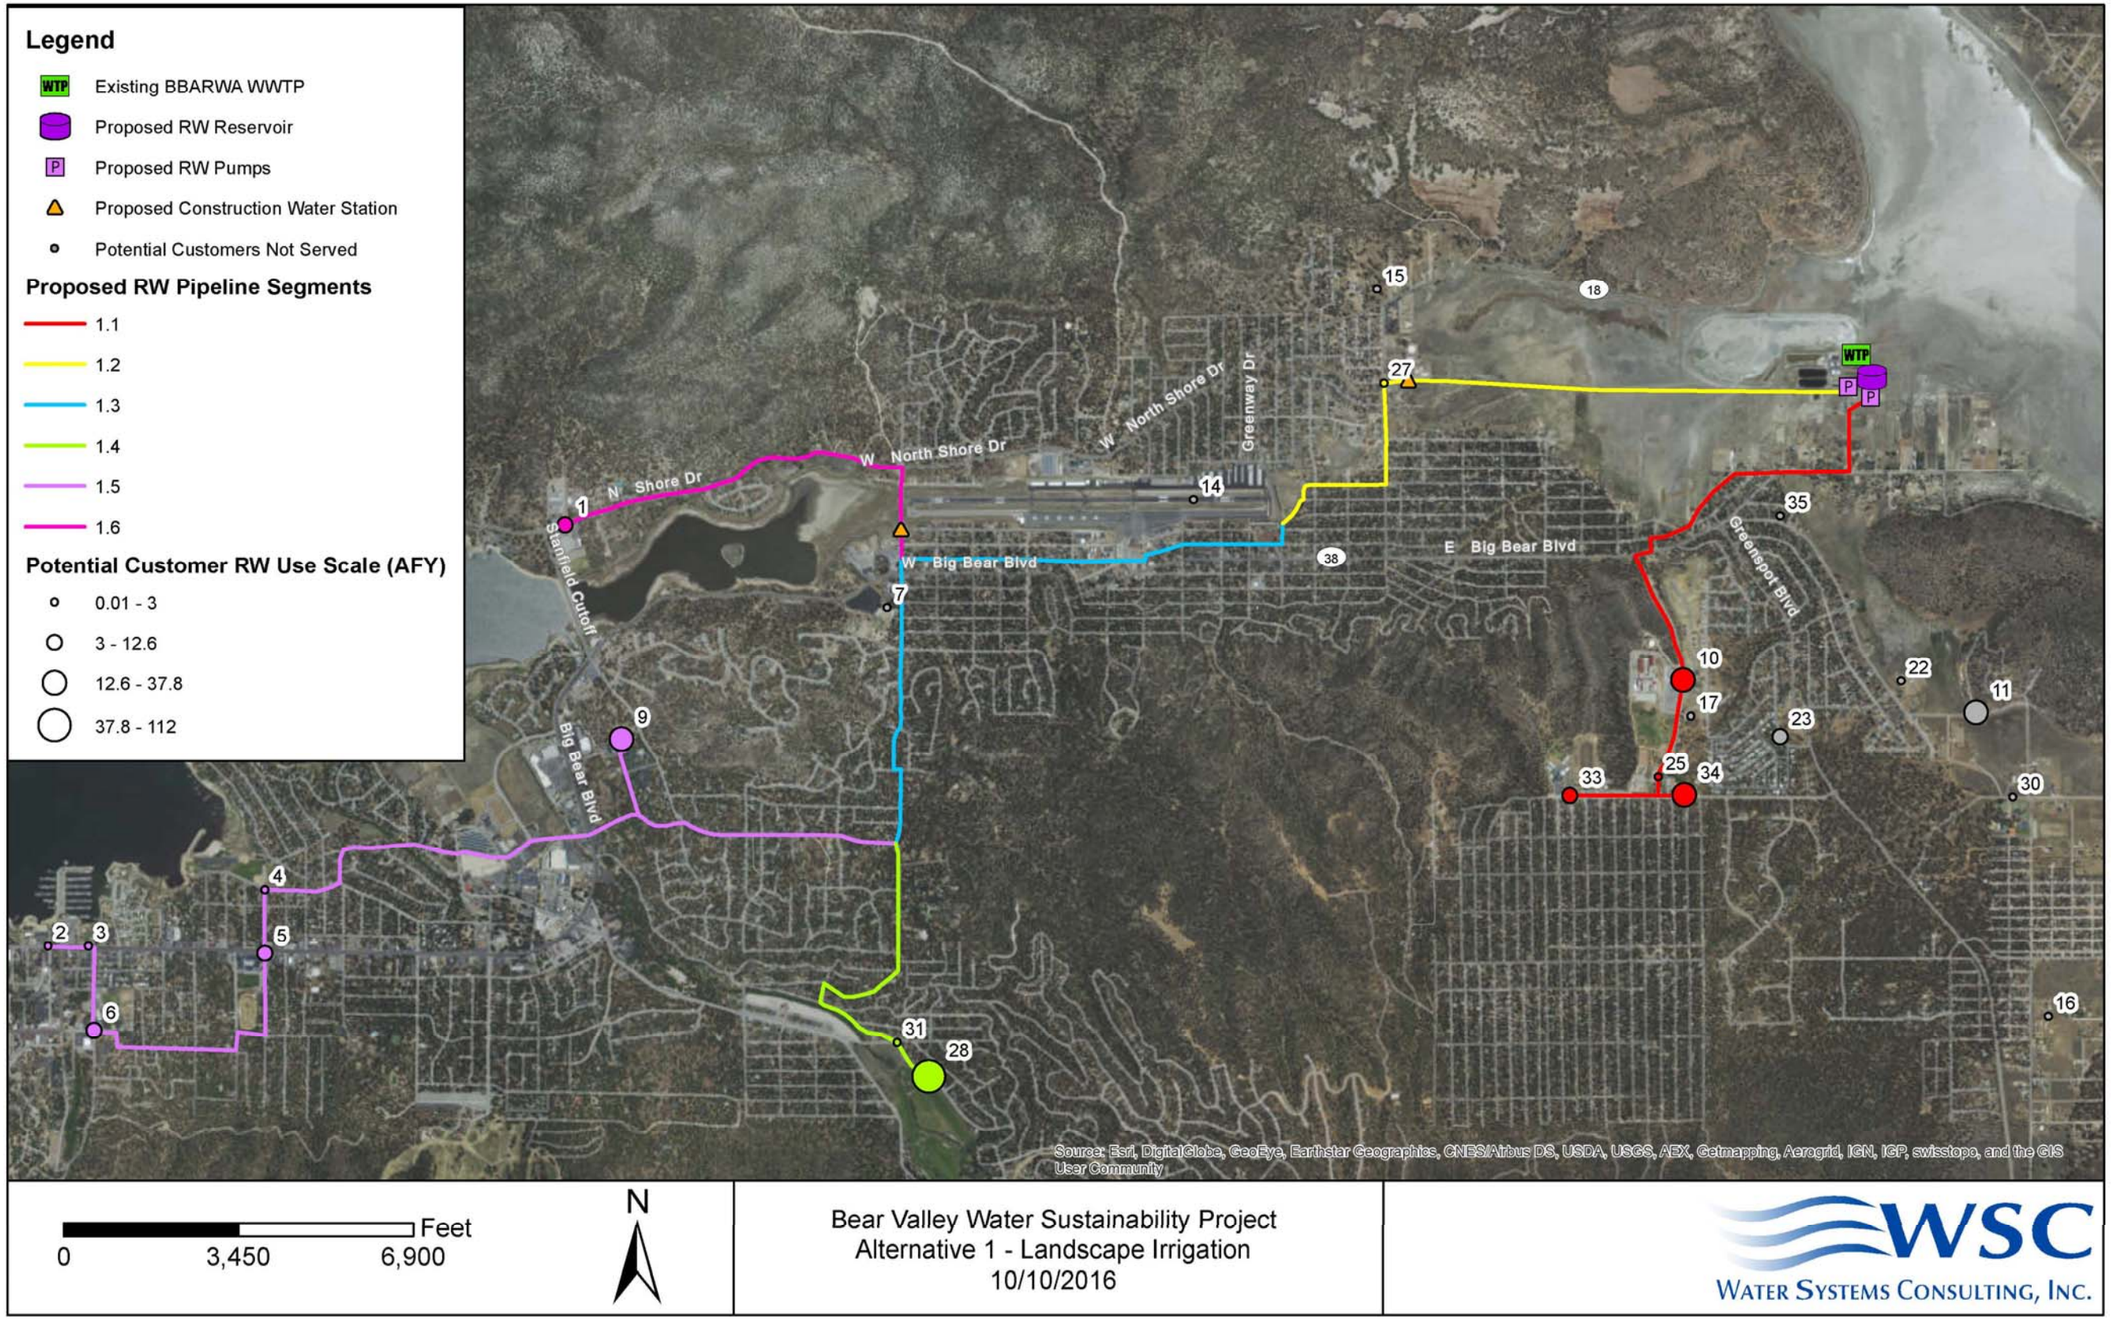

Figure 5-2. Alternative 1 Overview

The infrastructure analysis and cost estimates are presented incrementally and cumulatively by segment to illustrate how unit costs and infrastructure requirements vary as additional segments are implemented. This approach allows the Project Team to make cost versus benefit based decisions to incrementally expand the system as determined feasible.

Depending on which RW distribution system segments are constructed, the beneficial use yield ranges from 54 – 231 AFY, or approximately 3 - 12% of the total treated effluent from BBARWA in 2015. If the demand from the Big Bear Golf Course is excluded, the maximum yield would be 111 AFY, or 6% of the total treated effluent in 2015. Potable water demands could potentially be offset further through use of recycled water for construction uses, although it is not expected to be a significant or consistent future use. Table 5-1 provides a summary of the annual average demand in AFY of each segment.

Table 5-1. Customers and Annual Average Demand by Segment

Segment	Number of Customers Per Segment	Segment Annual Average Demand (AFY)	Cumulative Demand (AFY)
1.1	**4**	**54**	**54**
	10 - Big Bear High School	22.2	
	25 - Chautauqua High School B	2.1	
	33 - Baldwin Lake Elementary	7.7	
	34 - Sugarloaf Park	22.0	
1.2	**1**	**3**	**57**
	27 - Paradise Park	3.0	
1.3	**0**	**0**	**57**
1.4	**2**	**121**	**178**
	28 - Big Bear Golf Course	120	
	31 - Alpine Zoo	1.5	
1.5	**6**	**44**	**222**
	2 - Rotary Pine Knot Park	2.6	
	3 - Veterans Park	2.3	
	4 - Meadow Park	0.9	
	5 -Big Bear Middle School	12.6	
	6 - Big Bear Elementary School	5.1	
	9 - World Mark	20.6	
1.6	**1**	**9**	**231**
	1 - North Shore Elementary School	8.6	

5.1.1.3 *Storage, Pumping & Distribution System*

Implementation of Alternative 1 would require the construction of a storage tank and two RW booster pump stations at the BBARWA WWTP. To distribute the disinfected tertiary RW, 2.29 to 13.0 miles of recycled water mains would need to be installed, depending on the segments implemented. The onsite storage tank would range from 120,000 to 600,000 gallons in cumulative capacity, and function as a suction reservoir for the RW booster pump stations. The Project Team recently became aware of a 500,000-gallon modular precast concrete storage tank which was available from the U.S Army Corps of Engineers (COE). A cost analysis was performed to compare the value of transporting and erecting the precast tank with construction of a traditional cast-in-place concrete tank. It was determined the potential cost savings in purchasing the precast tank from the COE was outweighed by the risk of tank degradation or damage during storage and transport, therefore, the cost estimates in this Study are based on construction of a new storage tank. Appendix J includes the cost estimate and memorandum detailing the results of the cost analysis.

Segment 1.1 is independent of the others and would require a 248 gpm booster station which operates at a hydraulic grade line (HGL) of 7,200-ft. The remaining segments would require a cumulative booster pump station capacity for ranging from 17 - 990 gpm, and would operate at an HGL of 7,010-ft. System HGLs are selected to maintain the RW HGL 10 ft below the corresponding potable water system HGL for a given customer. By maintaining a lower pressure in the RW system reduces the risk of contamination of the potable water system in the event of a cross-connection between the two systems. Because segments 1.2-1.6 serve customers located in different potable pressure zones, some connections may require a pressure regulator to maintain an HGL that is lower than the potable HGL. The storage, pumping and distribution facilities are summarized in Table 5-2 and Table 5-3.

Table 5-2. Alternative 1 Facilities Summary

Segment #	Segment Annual Average Demand (AFY)	Cumulative Demand (AFY)	Segment Storage[1] (MG)	Cumulative Storage (MG)	Segment Booster Pump Capacity[2] (gpm)	Cumulative Booster Pump Capacity[2] (gpm)
1.1	54	54	0.13	0.13	248	272
1.2	3	57	0.08	0.21	17	17
1.3	0	57	-	0.21	-	17
1.4	121	178	0.35	0.56	720	737
1.5	44	223	0.10	0.66	205	942
1.6	9	231	0.02	0.68	49	991

Notes:
1. RW Storage sized for one maximum day demand (MDD)
2. Equal to peak hour demand (PHD). Segment 1.1 has a separate booster pump sized for 7200' HGL. Booster pump capacity for Segments 1.2-1.6 is cumulative, sized for 7010' HGL.

Table 5-3. Alternative 1 Pipeline Summary

Segment	Pipelines (miles)	Cumulative Pipeline Length (miles)	Pipe Size (in)[1]
1.1	2.29	2.29	4, 6, 8
1.2	2.15	4.44	12
1.3	2.17	6.61	12
1.4	1.15	7.76	10
1.5	3.79	11.6	4, 6
1.6	1.44	13.0	4

Notes:
1. Pipe sizing is based on all segments being constructed to serve all customers. Some sizes can be reduced if subsequent segments are not constructed.

5.1.1.4 *Operational Requirements*

It is estimated that the operation and maintenance of the treatment and distribution upgrades will required an additional 0.5 full time equivalent (FTE). The labor costs associated with the operations are included in the Annual Operation and Maintenance (O&M) costs presented in Section 5.1.1.5.

5.1.1.5 *Unit Cost*

The unit cost for Alternative 1 is broken down by each segment considered for the RW distribution system, as shown in Table 5-4. Itemized cost estimates for each segment are included in Appendix G.

Table 5-4. Unit Cost for Alternative 1

Segment #	Total Capital Cost	Annual O&M	Segment Unit Cost	Cumulative Unit Cost
1.1	$3.26 M	$65,000	$3,950	$3,950
1.2, 1.3 & 1.4	$11.4 M	$101,000	--	$5,010
1.5	$4.06 M	$30,000	$4,880	$4,980
1.6	$1.31 M	$11,000	$8,250	$5,140

5.1.1.6 *Advantages and Disadvantages*

Compared to the groundwater recharge alternatives, the disinfected tertiary alternative is the easiest to implement in terms of regulatory approval and treatment upgrades. Regulations for disinfected tertiary RW production for landscape irrigation are established and well understood, so minimal regulatory barriers are anticipated for implementation of Alternative 1. BBARWA's Santa Ana WDR already includes the use of tertiary treated disinfected effluent for irrigation in the Big Bear Valley Groundwater Management Zone. Various proprietary cloth media filters are approved by the CDPH as a Title 22 filtration process, therefore effluent water quality is expected to be reliable. BBARWA staff also maintain some familiarity with chlorine dosing systems from prior RW practices.

The BBARWA WWTP is distant from a majority of the potential RW users, requiring 13 miles of pipelines and booster station energy to distribute the RW throughout the Valley. Segment 1.1 provides the lowest unit cost but results in only 54 AFY of recycled water yield, or 3% of the total available treated effluent. The remaining segments have a significantly higher unit cost and are based on the assumption that all potential RW users convert to RW, although the Big Bear Valley agencies have expressed uncertainty in the willingness for some customers to convert. Specifically, the WorldMark Resort has been removing turf and their future irrigation water use is expected to decline, and the golf course currently owns private wells that produce water at a much lower cost than the Alternative 1 unit cost. Without these types of significant users, the unit cost of the RW in Alternative 1 increases considerably.

The maximum potential benefit of Alternative 1 is keeping 231 AFY of water in the valley, or roughly 13% of what was exported in 2015. With the added uncertainty of customer conversion to RW that would increase unit cost and reduce beneficial use yield, Alternative 1 does not adequately address the Bear Valley agencies' goal of developing a cost effective, drought proof and sustainable water source.

5.1.1.7 *Potential Refinements*

Alternative 1 does not beneficially use all of the treated effluent in the Valley but could potentially co-exist with a fish hatchery at the BBARWA WWTP site that uses excess treated effluent to provide makeup water to a recirculating fish hatchery treatment system. If a wetlands system is used as part of a fish hatchery treatment system, that process could potentially be used to produce tertiary treated disinfected recycled water for landscape irrigation customers. A conceptual PFD for this concept is depicted in Figure 5-3.

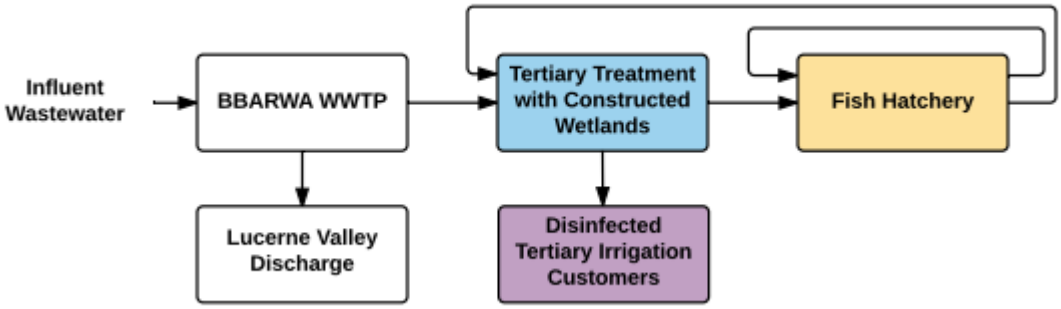

Figure 5-3. Alternative 1 Potential Refinement Process Flow Diagram

5.1.2 Alternative 2: Groundwater Recharge at Greenspot

Alternative 2 includes upgrading BBARWA's existing WWTP to include tertiary and advanced treatment for production of both disinfected tertiary water and advanced purified water for groundwater recharge at the Greenspot Recharge Site. As discussed in Section 4.2.3.1, the anticipated recharge capacity at the Greenspot site is 1,000 AFY, subject to sufficient pumping from the nearby extraction well field to maintain storage volume in the basin.

5.1.2.1 *Treatment Upgrades*

For Alternative 2, BBARWA's existing secondary treatment and clarification facilities are assumed to be sufficient for adequate BOD and TSS removal prior to tertiary treatment. The secondary effluent from the existing WWTP would be fed to the advanced treatment process train consisting of:

1. Microfiltration/ultrafiltration (MF/UF)
2. Reverse Osmosis (RO)
3. Ultraviolet Advanced Oxidation (UV/AOP)
4. Brine Disposal

The combination of MF, RO and UV/AOP is considered the conventional indirect potable reuse treatment train. This treatment train meets the criteria in the DDW Regulations Related to Recycled Water (Title 22, Article 5.2).

One of the issues with the RO process is that the TDS removed from the feed water is concentrated into a brine stream that needs to be disposed of. Based on the results of previous investigations and pilot testing of brine treatment and disposal alternatives for the BBARWA WWTP, the recommended method of brine disposal was effluent mixing coupled with brine reduction and evaporation ponds (16). Under this scenario, a portion of the brine would be mixed with the secondary effluent that is discharged to the LV Site for irrigation. The portion of brine that is mixed would be limited to ensure that the effluent meets the discharge requirements of the Colorado WDR permit for the LV Site. For the remaining brine, Vibratory Shear-Enhanced Processing (VSEP) would be used to reduce the volume of concentrate. The reduced concentrate would then be conveyed to new, lined evaporation ponds on the LV Site. A smaller brine pipeline would be installed inside the existing discharge pipeline to the LV Site. Note that this brine management scheme is dependent on BBARWA's WDR TDS effluent limits for discharge to the LV Site; as stated in Section 3.2.1, the TDS limit will be revised following a site specific study scheduled for completion in December 2017. The brine disposal costs for this alternative are based on this scenario and costs were estimated by escalating the costs estimates in the prior report to the cost basis used in this Study.

A PFD for Alternative 2 is shown in Figure 5-4. The new facilities required for this alternative are outlined in blue. Additional detail on each of the treatment systems is provided in Appendix F.

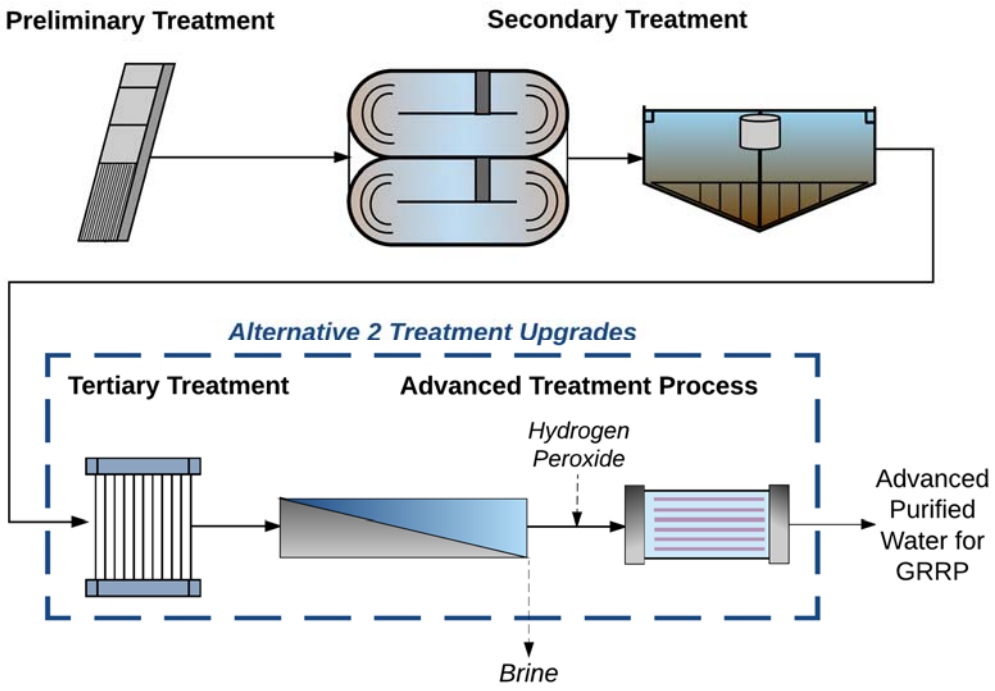

Figure 5-4. Treatment Process Flow Diagram for Alternative 2

5.1.2.1.1 Advanced Treatment Blending Considerations

As discussed in Section 3.3.1, there are two primary factors that influence the requirement for advanced treatment: the RWC and the water quality objectives for the beneficial use location.

Based on the prior Greenspot recharge analysis discussed in Section 4.2.3.1, total inflow to the Erwin Subunit is approximately 900 AFY. Dilution credit can be obtained for the portion of this flow in the uppermost portion of the aquifer in the vicinity of the recharge site. The prior studies did not provide this level of detail but, based on the proportional area of the approximate recharge area to the total model area, the underflow in the vicinity of the recharge basins may be on the order of 100 AFY. The sum of underflow and advanced purified water must be 80% of the total water in the recharge area, such that tertiary RW is equal to 20% of the total water to meet the RWC requirement. Assuming an underflow credit of 100 AFY, advanced treatment of 78% of the recharge water would be required to meet the initial RWC requirement of 20%, as shown in Table 5-5.

Table 5-5 Water Sources for Alternative 2 Groundwater Recharge

Water Source	Contribution, AFY	Contribution, % of Total
Tertiary RW	220	20%
Advanced Purified Water	780	71%
Underflow	100	9%
Total	**1,100**	**100%**

The assimilative capacity for TDS in the Big Bear Valley Groundwater Management Zone has not been determined so a range of potential assimilative capacities was considered for this analysis. Recent water quality samples taken at BBLDWP's nearby Lakewood Wells showed an average TDS concentration of 230 mg/L. As the groundwater objective is 300 mg/L, it is assumed that the increment of 70 mg/L would be the maximum assimilative capacity available. Other locations in the basin have current TDS levels in excess of the TDS Objective, so it is likely that there may be no assimilative capacity for TDS, depending on the methodology applied. Based on the range of assimilative capacity for TDS from 0 to 70 mg/L, 30-45% of the flows would need to be treated with MF and RO to comply with the Basin Plan.

The RWC requirement of 78% advanced treatment controls. For Alternative 2, it is assumed that 22% of the recharge water will receive tertiary treatment and 78% will receive advanced treatment to meet groundwater recharge blending requirements and the Basin Plan objective for TDS. The treatment process will be sized to produce 1,000 AFY of blended water for recharge and the remaining flows treated at the existing BBARWA WWTP will continue to be discharged to the LV Site.

A simplified PFD representing this blending scenario is shown in Figure 5-5.

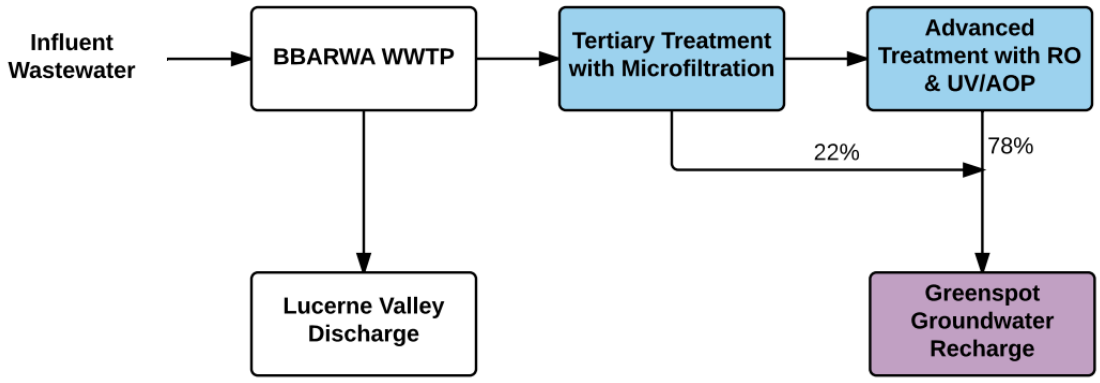

Figure 5-5. 22% Tertiary/78% Advanced Treatment Process Flow Diagram for Alternative 2

5.1.2.2 *Distribution System & Recharge Facilities*

Approximately 16,200 ft of 12-in pipeline is required to convey the RW to the Greenspot Recharge Site. A new 0.9 MG storage tank and approximately 620 gpm pump station would also be constructed on the BBARWA WWTP site for storage and conveyance to the recharge ponds.

The Greenspot Recharge Site is assumed to be a 7-acre site to allow more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access.

This alternative includes the addition of 6 extraction wells downgradient of the recharge site to effectively intercept the water that is artificially recharged at the Greenspot Recharge Site. The Greenspot recharge facilities also include 2 monitoring wells for sampling and monitoring the groundwater water quality in accordance with the Groundwater Recharge Regulations. These wells are assumed to have a pumping capacity of 100 gpm each.

The location of the facilities required for Alternative 2 are shown in Figure 5-6.

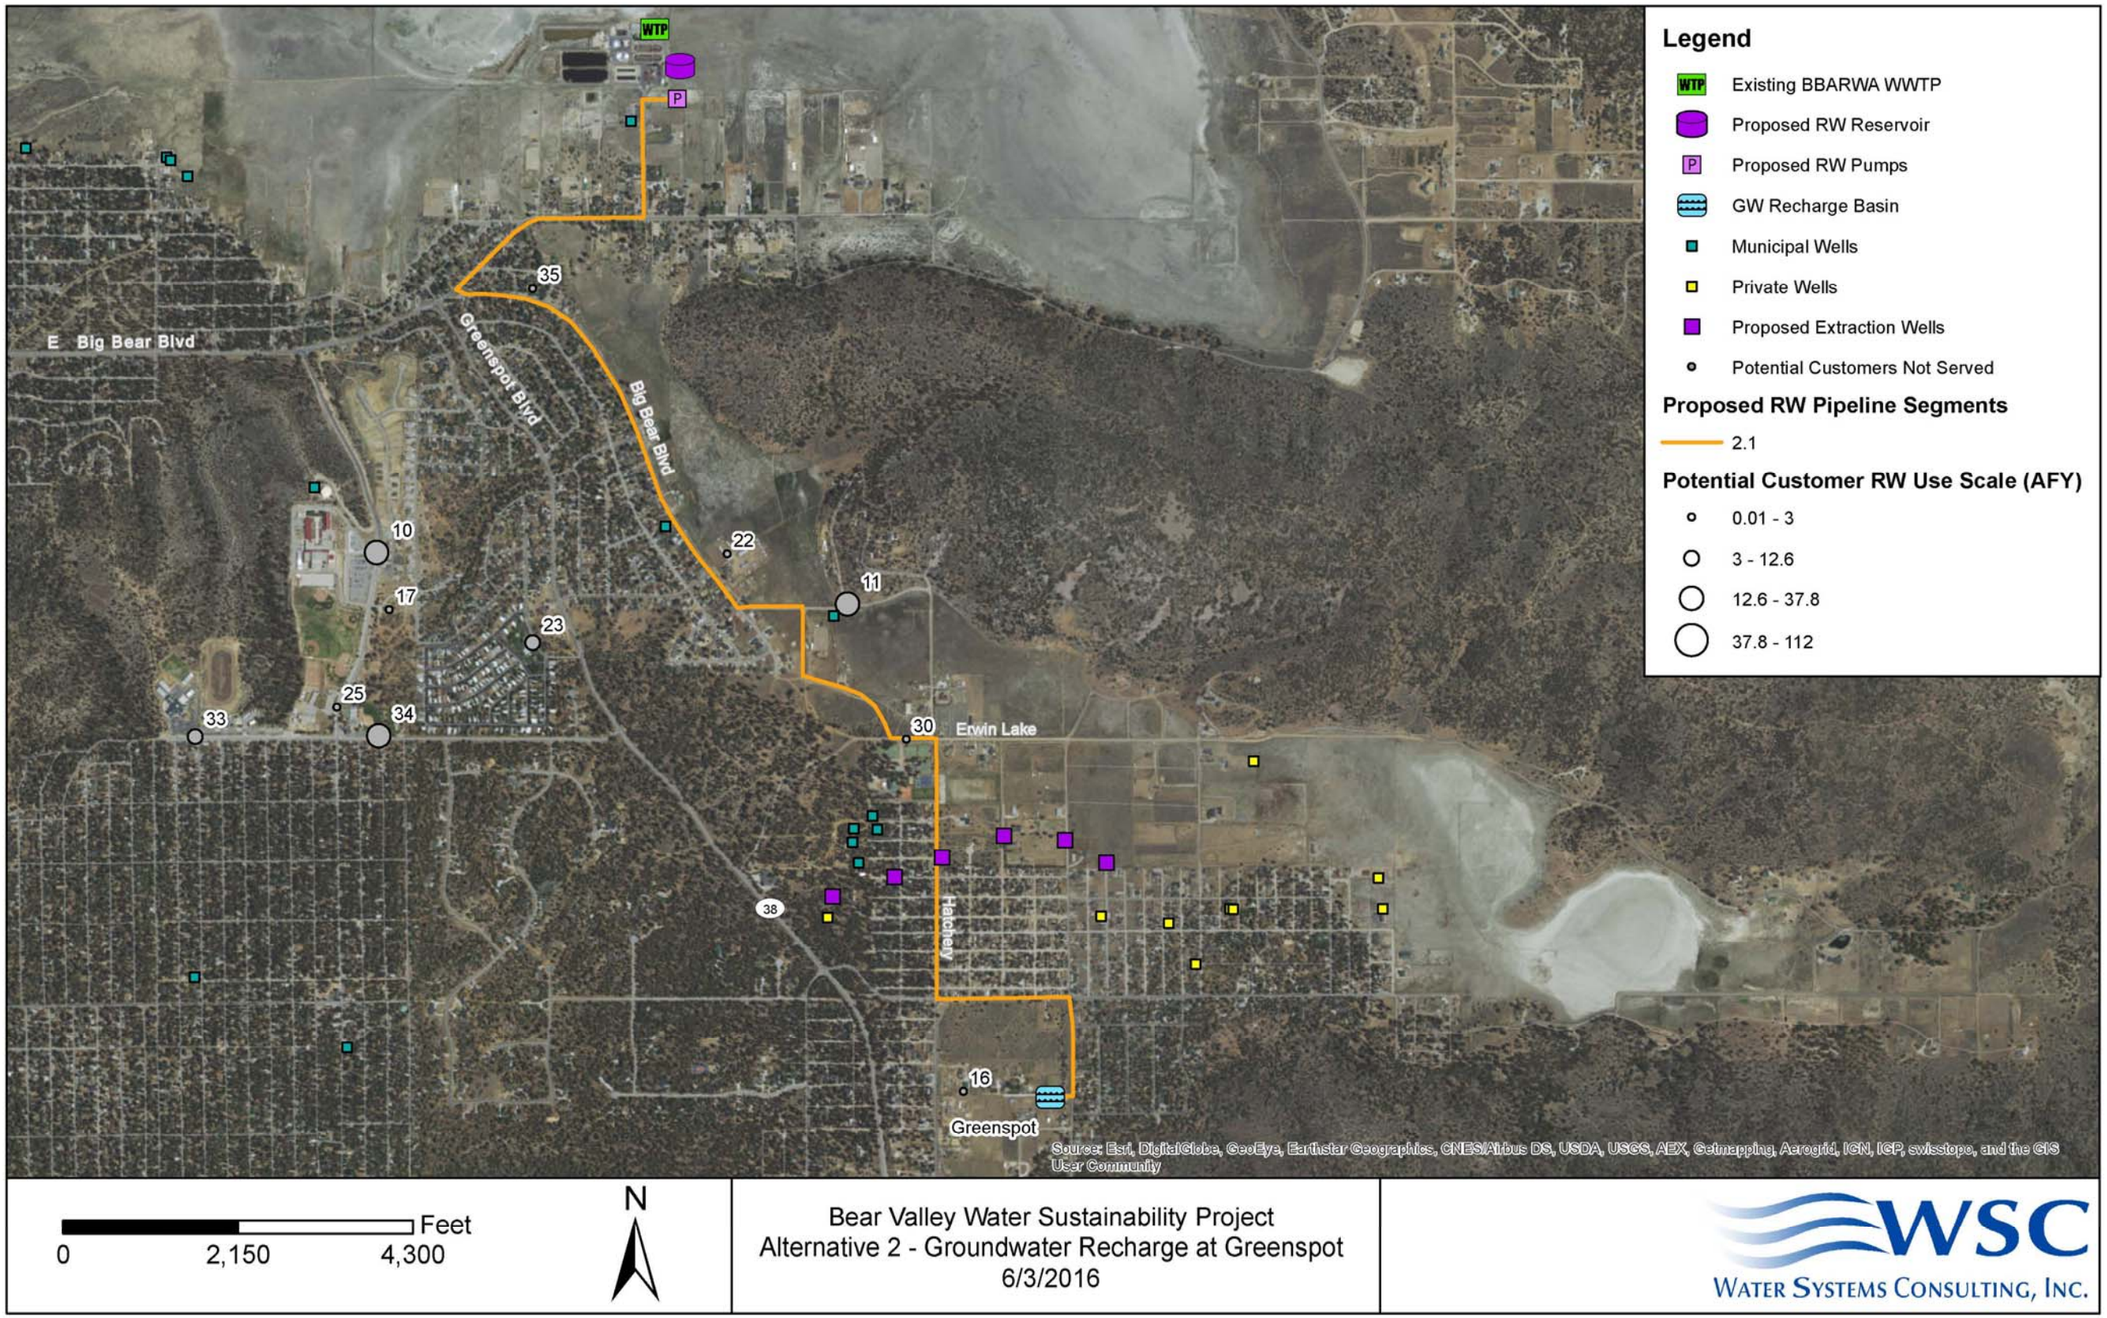

Figure 5-6. Alternative 2 Overview

5.1.2.3 *Operational Requirements*

It is estimated that the operation and maintenance of the treatment and distribution upgrades for Alternative 2 will require an additional 1.5 FTE. The labor costs associated with the operations are included in the Annual O&M costs presented in Section 5.1.2.4.

5.1.2.4 *Unit Cost*

The unit cost for Alternative 2 is shown in Table 5-6. Itemized costs estimates are included in Appendix G.

Table 5-6. Unit Cost for Alternative 2

Total Capital Cost	Annual O&M	Unit Cost ($/AF)
$44,533,000	$1,539,000	$3,580

5.1.2.5 *Advantages and Disadvantages*

Alternative 2 provides the highest recycled water yield and retains 50% of the available treated effluent in the Valley.

Recharge at the Greenspot site has been evaluated extensively in the past through groundwater modeling and pilot recharge testing. Therefore, there are relatively few uncertainties regarding the implementation, operation, and effectiveness of this alternative. Determination of the underflow credit using the existing groundwater model will be needed to confirm the advanced treatment volume required to meet RWC blending requirements.

The available groundwater storage in the Erwin subunit is relatively small so recharge and extraction operations will need to be closely coordinated to avoid excessive increase or decrease of water level in the vicinity of the recharge site. BBLDWP and BBCCSD would need to shift a significant portion of their production to the new or existing wells located downstream of the recharge site.

BBLDWP's existing Lakewood and Maple wells in this area are already underutilized and shifting production to their Erwin Lake system is not desirable for the operation of their water system. The Erwin Lake Zone is the lowest zone in their water system, has the fewest customer connections, and is remote from the rest of BBLDWP's water system.

Water recharged at the Green Spot Site would reach the nearest known production wells (BBLDWP's Lakewood well field) in 8.5 to 17.5 months, which meets the travel time and retention time requirements in the groundwater recharge regulations. However, DWR records suggest that some existing private wells are located in the vicinity of the proposed recharge basins and would be within 6-months travel time from the proposed basins. The exact locations of these wells will have to be verified and mitigation measures may need to be identified and implemented if there is not sufficient travel time from these wells.

Alternative 2 does not provide habitat or recreational benefits to the Lake or the community.

5.1.2.6 *Potential Refinements*

Another potential environmental use in this area is to provide recycled water for the Shay Creek unarmored threespine stickleback fish habitat. This particular stickleback fish is a state- and federally listed endangered species. Since 1985, the BBCCSD has provided potable water to the pond to maintain the wetland habitat that supports this federally listed endangered fish. The average volume of potable water provided to the stickleback habitat between 2011 and 2014 was 38 AFY. The pipeline to the Greenspot recharge site runs near the Shay Pond and could be connected to the Shay Pond by adding approximately 400 ft of pipe. This would provide an additional potable water offset of 38 AFY. However, due to the sensitivity of the species, coordination with several resource agencies would be required and there may be difficulty obtaining regulatory approval for this use.

Alternative 2 does not beneficially use all of the treated effluent in the Valley but could potentially co-exist with a fish hatchery at the BBARWA WWTP site that uses the excess treated effluent to provide makeup water to a recirculating fish hatchery treatment system. A conceptual PFD for this concept is depicted in Figure 5-7.

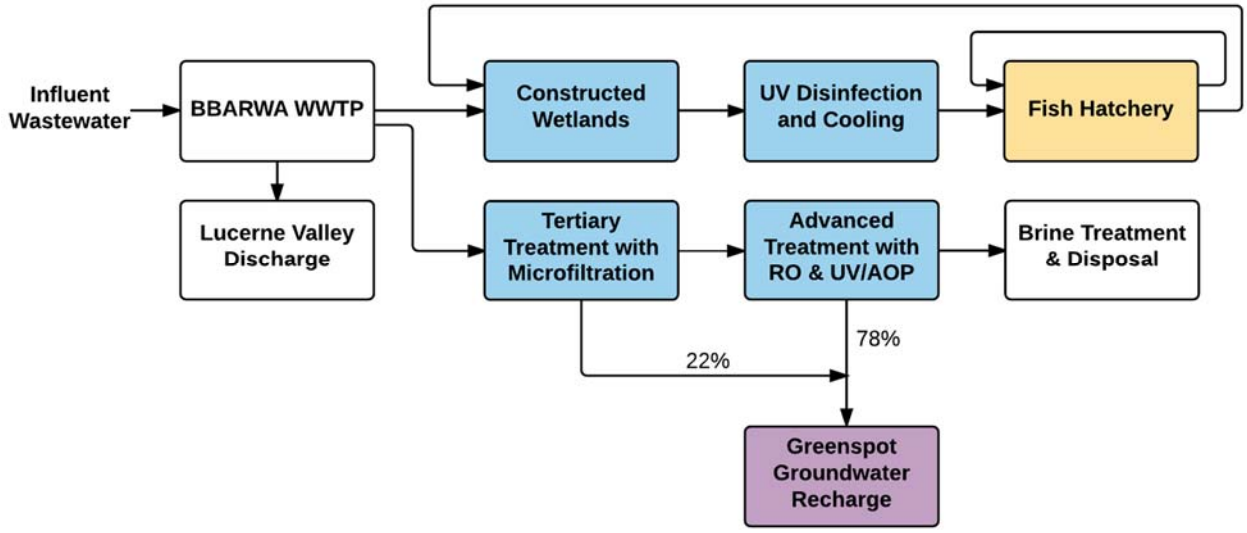

Figure 5-7. Alternative 2 Potential Refinement Process Flow Diagram

5.1.3 Alternative 3: Groundwater Recharge at Sand Canyon

Alternative 3 includes a new satellite advanced treatment facility located near BBARWA's existing Lake Pump Station, which is the sewer lift station that currently conveys waste water from the City of Big Bear Lake to the BBARWA WWTP. The satellite WWTP would produce both disinfected tertiary recycled water and advanced purified water for groundwater recharge at the Sand Canyon Recharge Site.

In 2014, the average annual flows to the Lake Pump Station were 0.84 MG and minimum daily flows of approximately 0.50 MGD are observed in the spring and fall months. The capacity of the satellite WWTP is assumed to be 0.5 MGD such that a baseline flow equal to annual minimum day flows is processed at the satellite facility. Sizing for annual minimum day flows reduces the amount of days per year that the process operates with excess capacity. It is assumed that solids and brine will be returned to the force main for treatment at BBARWA's existing WWTP along with any sewage flows in excess of 0.50 MGD. The collection system between the Lake Pump Station and the WWTP will need to be evaluated to assess whether the reduced flows would impact the ability to adequately convey solids to the WWTP. The volume of recycled water produced for beneficial use could range from 500 to 520 AFY, depend on the portion of the flows that receive advanced treatment, as discussed later in this section.

As discussed in Section 4.2.3.1, the anticipated recharge capacity of the Sand Canyon site is 750 AFY, so the limiting factor is the volume of recycled water that can be produced at the satellite WWTP.

5.1.3.1 *Treatment Upgrades*

For Alternative 3, a new satellite WWTP would be constructed near BBARWA's existing Lake Pump Station. The new treatment processes required for this alternative include:

1. Preliminary Treatment
2. Secondary and Tertiary Treatment. A Membrane Bioreactor (MBR) process is assumed.
3. Reverse Osmosis (RO)
4. Ultraviolet Advanced Oxidation (UV/AOP)
5. Brine Disposal

The combination of MBR, RO and UV/AOP is considered a conventional indirect potable reuse treatment train. This treatment train meets the criteria in the DDW Regulations Related to Recycled Water (Title 22, Article 5.2). One of the issues with the RO process is that the TDS removed from the feed water is concentrated into a brine stream that needs to be disposed of.

A PFD for Alternative 3 is shown in Figure 5-8. The new facilities required for this alternative are outlined in blue. Additional detail on each of the treatment systems is provided in Appendix F.

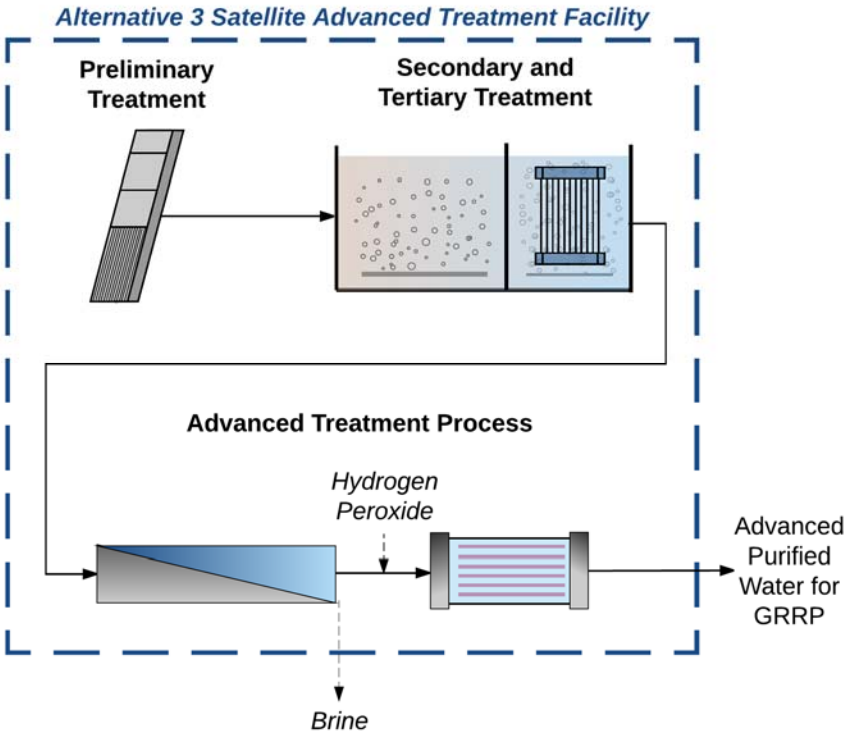

Figure 5-8. Treatment Process Flow Diagram for Alternative 3

5.1.3.1.1 Advanced Treatment Blending Considerations

As discussed in Section 3.3.1, there are two primary factors that influence the requirement for advanced treatment: the RWC and the water quality objectives for the beneficial use location.

The prior studies regarding evaluating recharge at the Sand Canyon Site did not address underflow at this location so a range of potential underflow values is considered for this alternative to provide a range of treatment costs. The 2012 United Stated Geological Survey (USGS) Geohydrology Report estimates the total recharge for the Rathbone subbasin to be 1,100 to 1,200 AFY (17). As a range of potential underflows, if 200 AFY is available for dilution credit, ~70% advanced treatment would be required; if 900 AFY is available for dilution credit, ~45% advanced treatment would be required to meet the 80% blend requirement and achieve an initial RWC requirement of 20%, as shown in Table 5-7. The 45% value was selected as a representative scenario to align with the RO treatment ratio required to meet the Basin Plan objective for TDS (discussed in the following paragraph) to provide a low range cost for this alternative.

Table 5-7 Water Sources for Alternative 3 Groundwater Recharge

	High Range Treatment Cost		Low Range Treatment Cost	
Water Source	Contribution, AFY	Contribution, % of Total	Contribution, AFY	Contribution, % of Total
Tertiary RW	140	20%	285	20%
Advanced Purified Water	360	51%	235	17%
Underflow	200	29%	900	63%
Total	**700**	**100%**	**1,420**	**100%**

The assimilative capacity for TDS in the Big Bear Valley Groundwater Management Zone has not been determined; however, recent water quality samples taken at BBLDWP's nearby wells showed an average TDS concentration greater than the Basin Plan objective for TDS of 300 mg/L. Therefore, it is assumed that there is no assimilative capacity for TDS. To meet the TDS objective of 300 mg/L, 45% of the flows would need to be treated with RO to comply with the Basin Plan.

For Alternative 3, a range of advanced treatment requirements was evaluated to provide bookends based for treatment costs based on a range of advanced treatment blends to meet dilution and TDS removal requirements. The high range cost for this alternative is based on 70% advanced treatment and 30% tertiary treatments. The low range cost for this alternative is based on 45% advanced treatment and 55% tertiary treatment. This is the minimum advanced treatment that could be required to achieve TDS removal and would require a significant underflow credit of 750 AFY. A simplified PFD representing this blending scenario is shown in Figure 5-9.

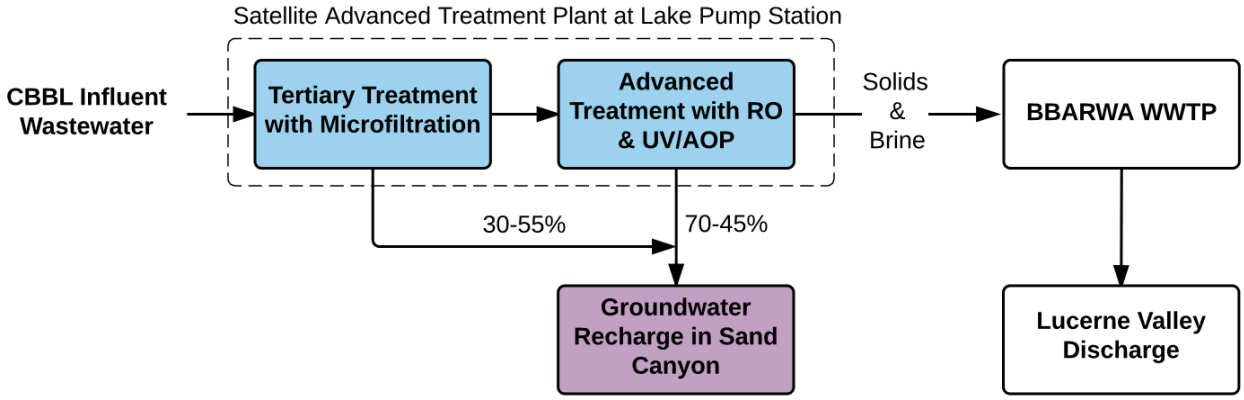

Figure 5-9. Treatment Process Flow Diagram Summarizing Blending Options for Alternative 3

5.1.3.2 *Distribution System & Recharge Facilities*

Approximately 17,400 ft of 8-in pipeline is required to convey the recycled water to the Sand Canyon Recharge Site, as well as a 310-320 gpm pump station at the new satellite WWTP.

The Sand Canyon Recharge Site is assumed to require 2.5 acres of recharge area based on the recommendation in the 1991 GEOSCIENCE evaluation (14).

Alternative 3 includes construction of 2 monitoring wells that will be used to collect groundwater samples to monitor water quality in the area. The water recharged in this alternatives is assumed to be produced by existing BBLDWP extraction wells downgradient of the recharge site.

The location of the facilities required for Alternative 3 are shown in Figure 5-10.

5.1.3.3 *Operational Requirements*

It is estimated that the operation and maintenance of the treatment and distribution upgrades for Alternative 3 will require an additional 2 FTE. The labor costs associated with the operations are included in the Annual O&M costs presented in Section 5.1.3.4.

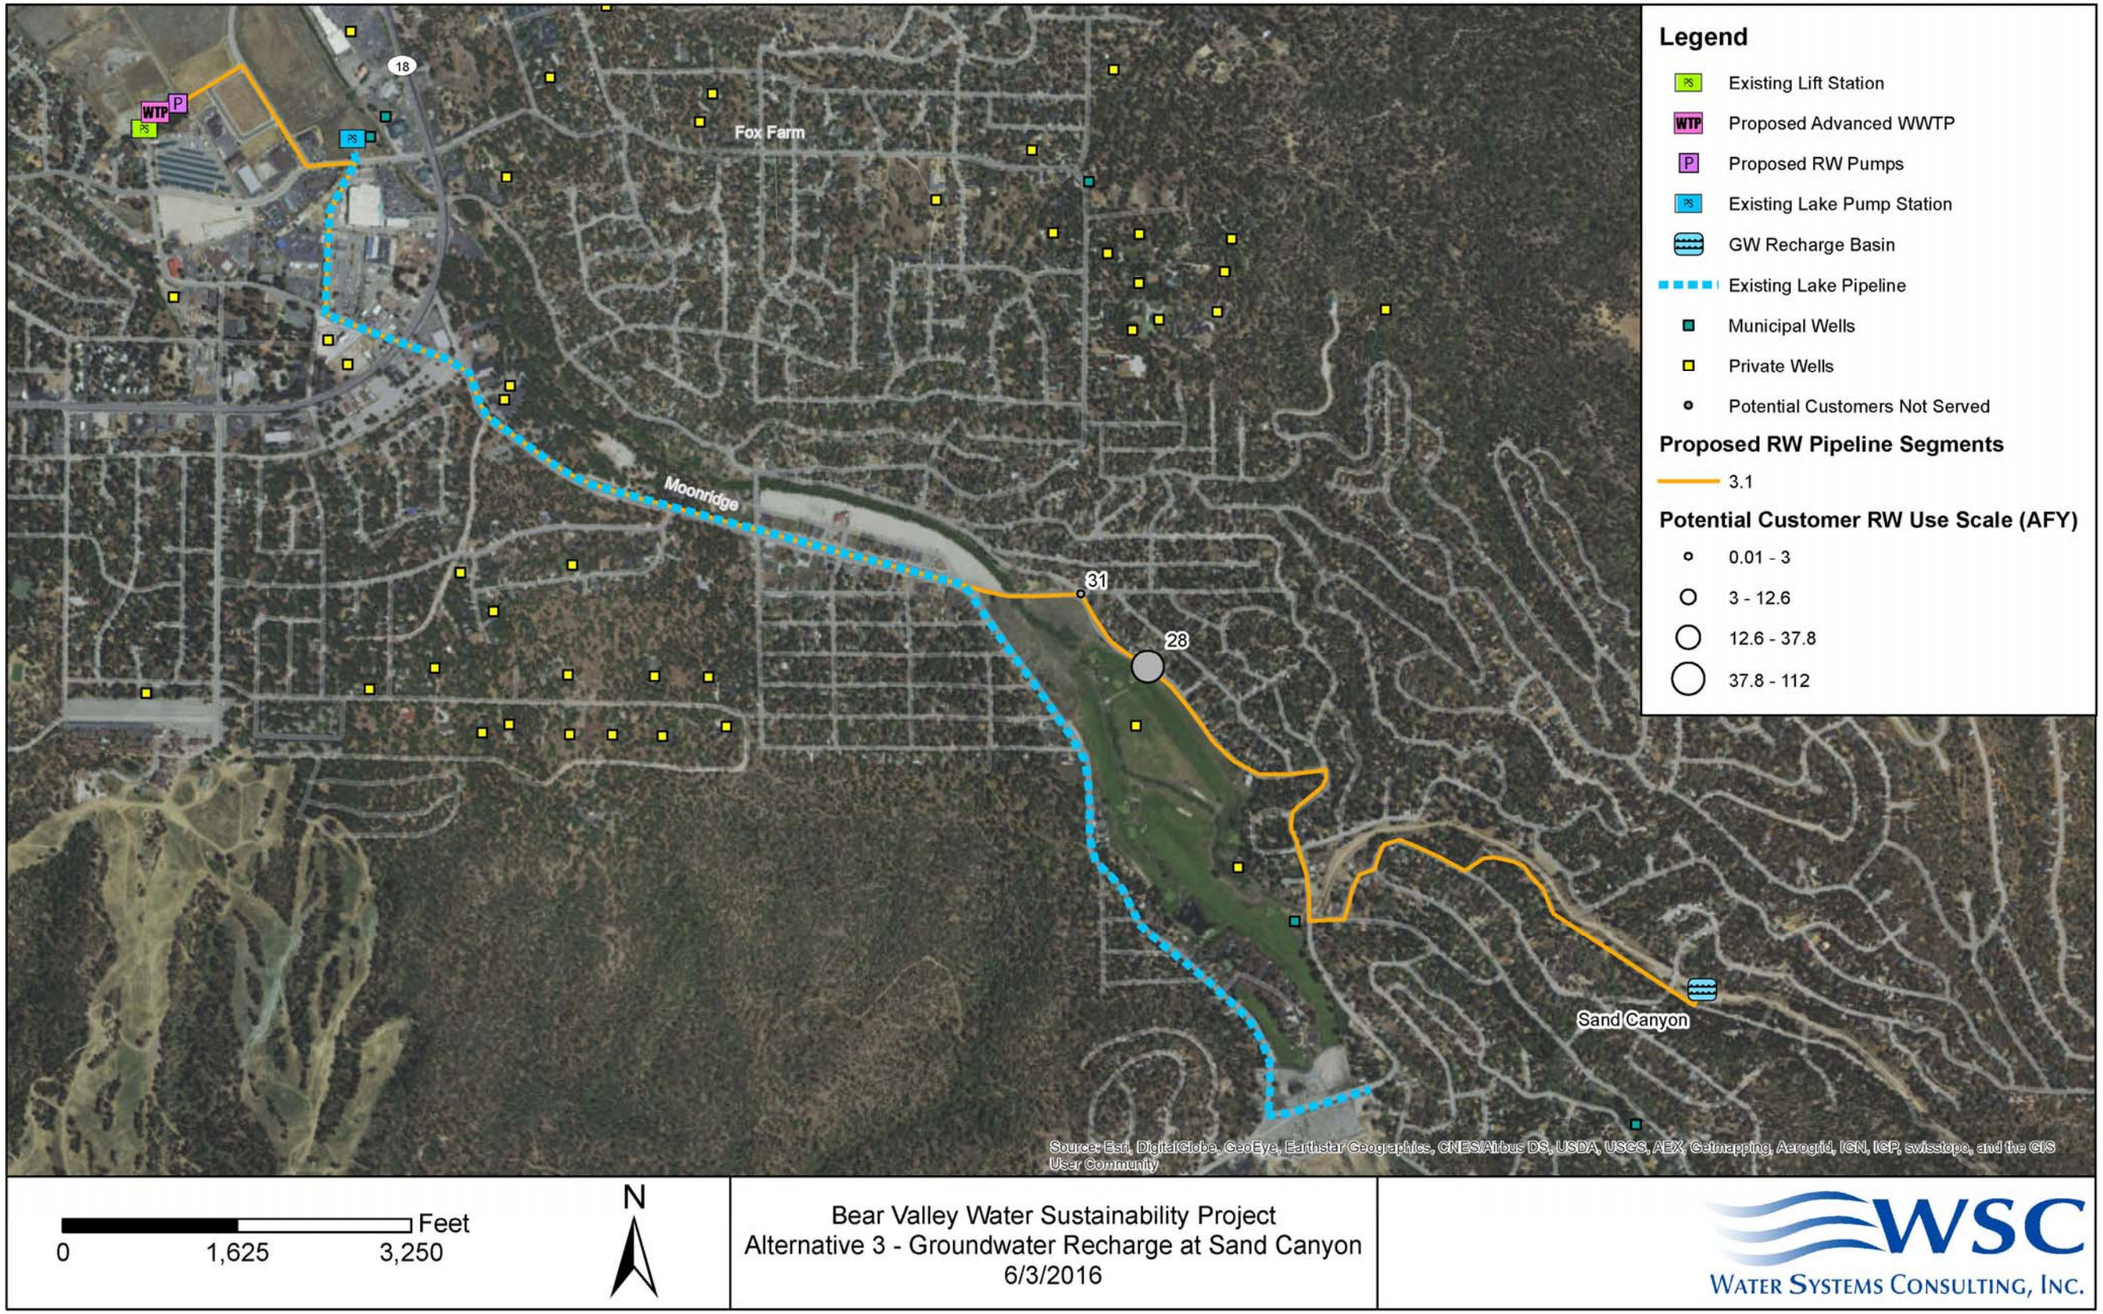

Figure 5-10. Alternative 3 Overview

5.1.3.4 *Unit Cost*

The range of unit costs for Alternative 3 is shown in Table 1-1, based on the range of advanced treatment requirements. Itemized costs estimates are included in Appendix G.

Table 5-8. Unit Cost for Alternative 3

Treatment Scenario	Total Capital Cost	Annual O&M	Unit Cost ($/AF)
70% Advanced 30% Tertiary	**$24,315,000**	1,259,000	$4,750
45% Advanced 55% Tertiary	**$23,255,000**	$1,174,000	$4,310

5.1.3.5 *Advantages and Disadvantages*

Alternative 3 provides 500-520 AFY of recycled water yield and retains approximately 25% of the available treated effluent in the Valley.

Alternative 3 includes the construction of a satellite WWTP at the Lake Pump Station and would require BBARWA to operate a second remote treatment facility.

Recharge at the Sand Canyon site has been evaluated in the past to confirm the feasibility of recharge at this site. Determination of the underflow credit using a groundwater model will be needed to confirm the advanced treatment volume required to meet RWC blending requirements.

The Sand Canyon channel serves as a flood control channel so all modifications and operations would need to be coordinated with and approved by the flood control agency. This adds some complexity to the implementation but is it expected to be technically feasible to use the channel for both artificial recharge and flood control.

BBLDWP's existing Sand Canyon and Lake Plant wells are downgradient of the Sand Canyon recharge site and can produce water for use in BBLDWP's Big Bear Lake and Moonridge systems, which are the two largest systems. BBLDWP can also provide water to BBCCSD through an existing interconnection.

Consistent recharge in the Sand Canyon stream would likely help stabilize Rathbun Creek underflows and may benefit the Lake by helping maintain more consistent flows in Rathbun Creek, which is tributary to the Lake.

5.1.3.6 *Potential Refinements*

There is an existing pipeline that runs from a pump station near the Lake to the Big Bear Mountain Resorts that provides Lake water for snowmaking and firefighting purposes. If this pipeline were used as a dual purpose to convey recycled water to the Sand Canyon site, the length of new pipeline required would be reduced by 9,700 ft. This would result in a cost savings of approximately $150/AF. However, the shared use of this pipeline may not be compatible with the operational requirements for both uses, and coordination with the Big Bear Mountain Resort would be required to assess the feasibility of this operation. Note that, Mammoth Resorts recently purchased the Big Bear Mountain Resorts and potential operational changes may affect water uses.

5.1.4 Alternative 4: Groundwater Recharge at Greenspot & Sand Canyon

Alternative 4 includes tertiary and advanced treatment upgrades to BBARWA's existing WWTP for production of both disinfected tertiary and advanced purified water for groundwater recharge at the Greenspot & Sand Canyon Recharge Sites. The anticipated recharge capacity is 1,750 AFY total, with 1,000 AFY at Greenspot and 750 AFY at Sand Canyon.

5.1.4.1 *Treatment Upgrades*

Alternative 4 requires tertiary and advanced treatment upgrades to BBARWA's WWTP. Based on historical effluent water quality data, it is assumed the existing primary and secondary treatment facilities at the BBARWA WWTP will produce secondary effluent suitable for tertiary filtration. The secondary effluent from the existing WWTP would be fed to the advanced treatment process train consisting of:

1. Microfiltration/ultrafiltration (MF/UF)
2. Reverse Osmosis (RO)
3. Ultraviolet Advanced Oxidation (UV/AOP)
4. Brine Disposal

As previously stated, this conventional IPR treatment train meets the criteria in the DDW Regulations Related to Recycled Water (Title 22, Article 5.2).

It is assumed the brine disposal management strategy for Alternative 4 will be identical to the brine disposal management strategy proposed for Alternative 2 described in Section 5.1.2.1. As previously noted, this brine disposal method must be re-evaluated following issuance of a WDR Order TDS limit for effluent discharge to the LV Site.

A PFD for Alternative 4 is shown in Figure 5-11. The new facilities required for this alternative are outlined in blue. Additional detail on each of the treatment systems is provided in Appendix F.

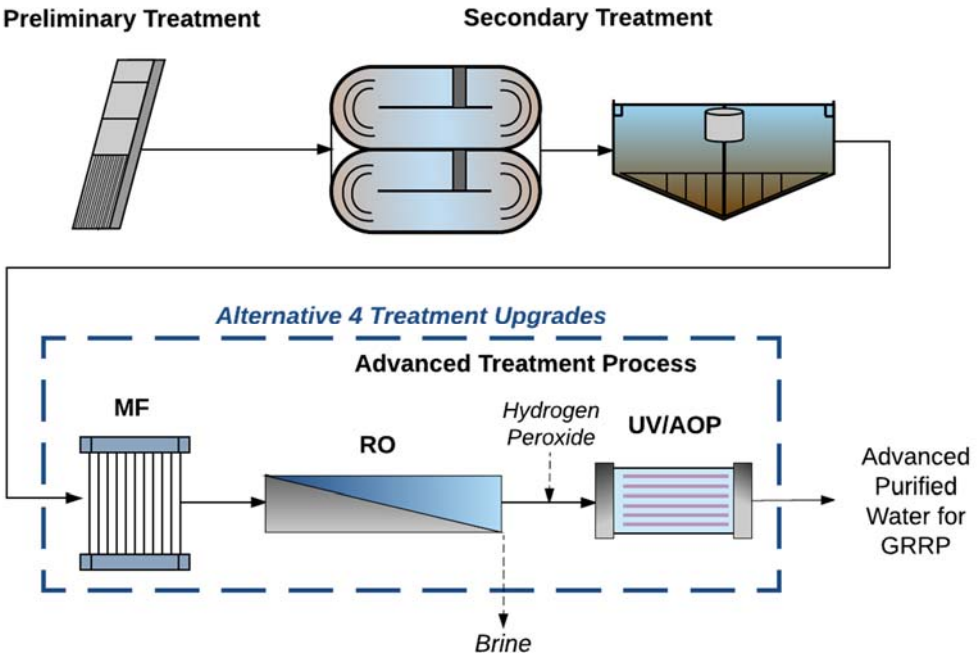

Figure 5-11 Treatment Process Flow Diagram for Alternative 4

5.1.4.1.1 Advanced Treatment Blending Considerations

Sections 5.1.2.1.1 and 5.1.3.1.1 provide an overview of the advanced treatment blending requirements for the Greenspot and Sand Canyon Sites based on results from prior studies and groundwater modeling analysis. For Alternative 4, it is assumed the underflow credit is 100 AFY at Greenspot and 200 AFY at Sand Canyon. The most stringent blending requirement of the two recharge sites governs the tertiary and advanced RW blending requirements and treatment capacities; this is done to avoid constructing duplicate facilities needed to store, pump and convey two different RW blends to each site. For the combined recharge project at Greenspot and Sand Canyon, the 22% Tertiary/78% Advanced blending requirement for Greenspot is required to meet the initial 20% RWC requirement at each recharge site. A simplified PFD representing this blending scenario is shown in Figure 5-12.

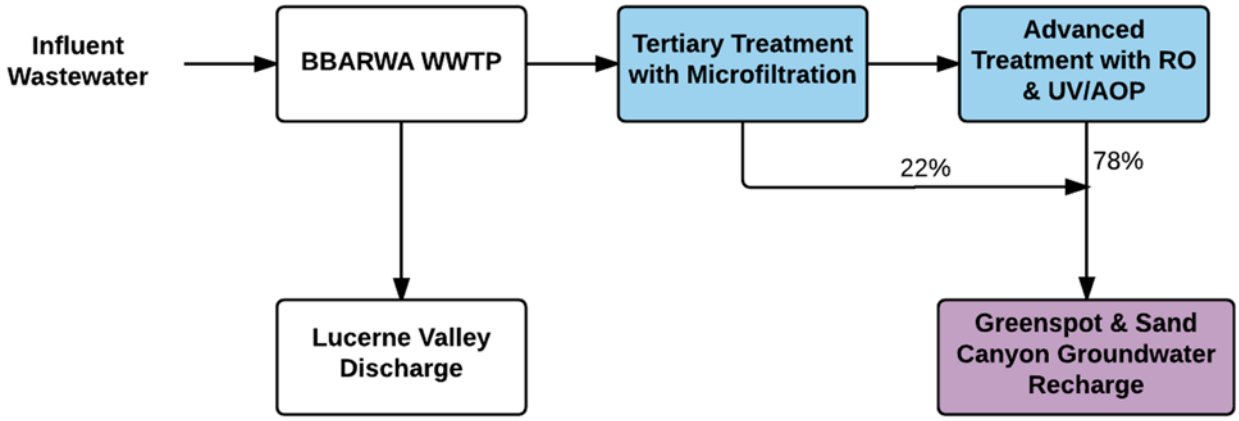

Figure 5-12 22% Tertiary/78% Advanced Treatment Process Flow Diagram for Alternative 4

5.1.4.2 *Distribution System & Recharge Facilities*

Approximately 50,200 ft of 12-in pipeline is required to convey the RW from the BBARWA WWTP to both recharge sites (approximately 16,200 ft to Greenspot and 34,000 ft to Sand Canyon). A new 1.6 MG storage tank and a pump station would also be constructed on the BBARWA WWTP site for storage and conveyance to the recharge ponds. The pump station would require pumps with capacities of approximately 615 gpm and 475 gpm to convey RW to Greenspot and Sand Canyon, respectively. The alignment and configuration of the distribution system can be optimized based on the final flow and head requirements of the distribution and recharge facilities.

The Greenspot Recharge Site is assumed to be a 7-acre site to allow more than five acres of area for surface water spreading, plus the necessary additional land for berms and maintenance access. The Sand Canyon Site is assumed to be a 2.5-acres based on the results from prior studies (14).

This alternative includes the addition of 6 extraction wells downgradient of the Greenspot recharge site to effectively intercept the water that is artificially recharged. These wells are assumed to have a pumping capacity of 100 gpm each. Water recharged at Sand Canyon is assumed to be produced by existing BBLDWP extraction wells downgradient of the recharge site. It is assumed 2 monitoring wells will be added at each recharge site for groundwater sample collection.

The location of the facilities required for Alterative 4 are shown in Figure 5-13.

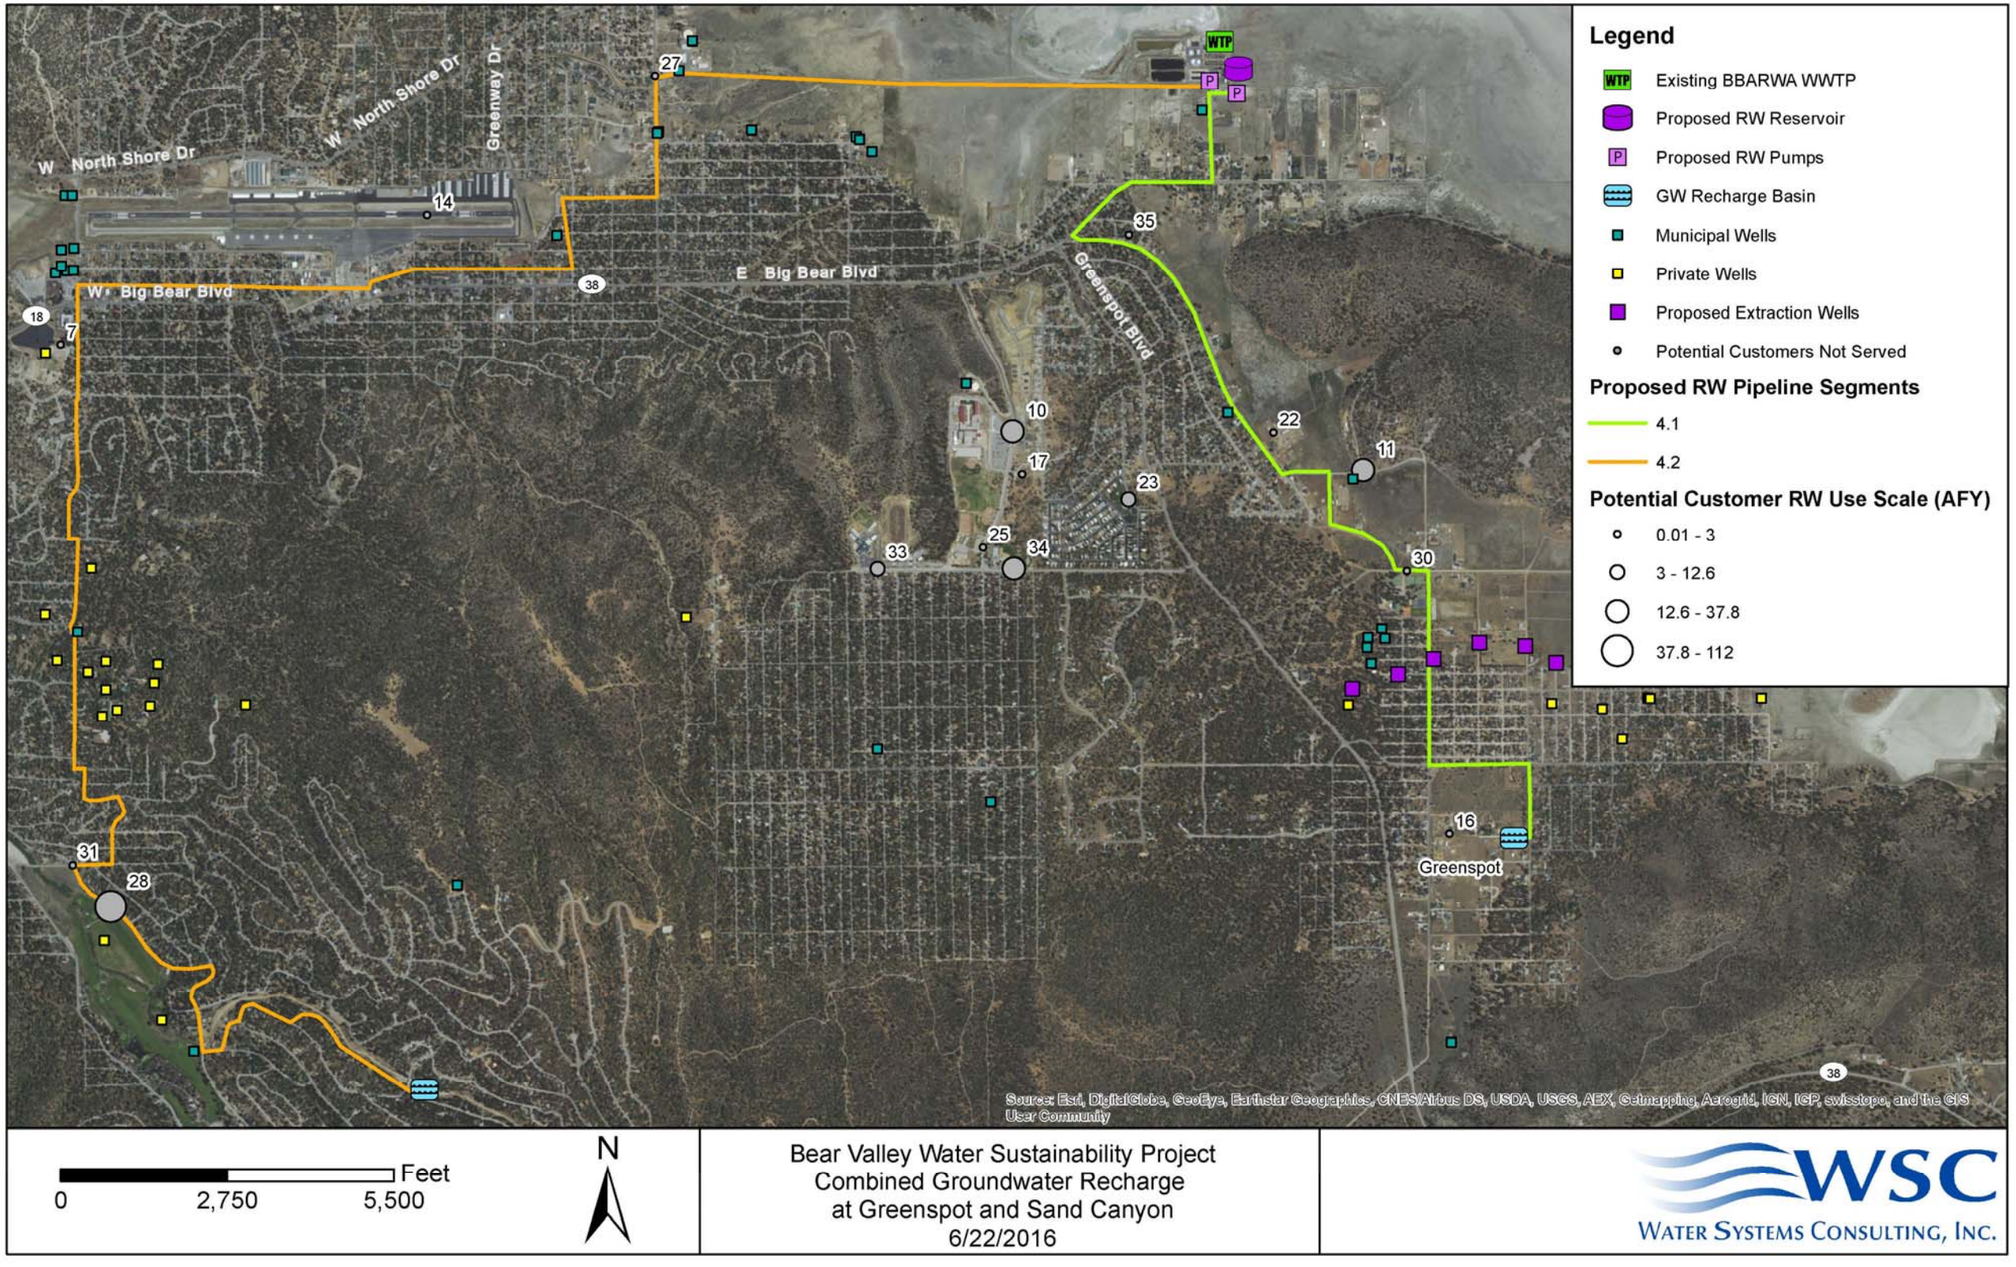

Figure 5-13 Alternative 4 Overview

5.1.4.3 *Operational Requirements*

It is estimated that the operation and maintenance of the treatment and distribution upgrades for Alternative 4 will require an additional 2 FTE. The labor costs associated with the operations are included in the Annual O&M costs presented in Section 5.1.2.4.

5.1.4.4 *Unit Cost*

The unit cost for Alternative 4 is shown in Table 5-9. Itemized costs estimates are included in Appendix G.

Table 5-9. Unit Cost for Alternative 4

Total Capital Cost	Annual O&M	Unit Cost ($/AF)
$69,700,000	$2,726,000	$3,390

5.1.4.5 *Advantages and Disadvantages*

Alternative 4 has the lowest unit cost of all the alternatives and it retains all the available RW in the Valley. The use of both recharge sites provides recharge in separate areas of the basin and provides some additional operational flexibility.

The key advantages to utilizing the Greenspot Recharge Site for an IPR application are discussed in Section 5.1.2.5. Most notably, the Greenspot site has been evaluated through extensive site-specific testing and it has been shown to have favorable recharge characteristics.

However, as stated in Section 5.1.2.5, the Greenspot Recharge Site would present some operational challenges for BBCCSD and BBLDWP. Both agencies would need to shift their production to the Erwin subunit to reclaim the recharge water and closely coordinate production well operations to ensure elevated groundwater levels do not hinder recharge potential at the site.

Prior studies have shown the Sand Canyon recharge site has soils ideal for recharge and percolation rates are sufficient to yield 750 AFY of recharge capacity. As described in Section 5.1.3.5, BBLDWP's existing Sand Canyon and Lake Plant wells are downgradient of the Sand Canyon recharge site and can produce water for use in BBLDWP's Big Bear Lake and Moonridge systems, which may be delivered to BBCCSD through an existing interconnection.

The main disadvantage to recharge at Sand Canyon is that it would have to serve as a flood control channel and a recharge basin, creating complexities in operational strategies and seasonal flood control management in the area.

Consistent recharge in the Sand Canyon stream would likely help stabilize Rathbun Creek underflows and may benefit the Lake by helping maintain more consistent flows in Rathbun Creek, which is tributary to the Lake.

5.1.4.6 *Potential Refinements*

Although Alternative 4 has the lowest unit cost of the alternatives considered, it also has the greatest capital cost. To potentially reduce the initial capital investment, a demonstration scale recharge project at Greenspot and a phased Alternative 4 project were considered as potential refinements to Alternative 4. These project refinements would reduce the technical, managerial and financial complexity of implementing Alternative 4 in one phase. The cost summaries for the potential refinement to Alternative 4 are included in Table 5-10 and the required facilities are described in the following subsections.

Table 5-10 Cost Summary for Potential Refinements to Alternative 4

Alternative	Capital Cost	O & M Cost	Recycled Water Yield, AF	Unit Cost, $/AF	Net Present Value
Greenspot Phase 1	$26,058,000	$746,000	440	$4,410	$47,120,000
Greenspot Demonstration	$5,133,000	$590,000	50	$16,520	$22,254,000

Although the reduced scale of a demonstration scale or phased project provides an economic benefit of reduced capital expenditures, implementation of a phased construction project includes inherent risks. Phased expansion of WWTPs can result in the procurement of different products for the identical unit process which creates operational complexity. Similarly, changing personnel between phases can lead to alternative design approaches and result in differing operational requirements for identical unit processes. Careful consideration would have to be placed on maintaining consistent design practices, asset nomenclature and proposed operational procedures to minimize the design and construction risks associated with a phased project.

5.1.4.6.1 Greenspot Phase 1

The first potential refinement consists of phasing the construction of the project by implementing a recharge project at Greenspot to yield 25% of the total Alternative 4 beneficial use yield, or approximately 440 AFY. Of the two recharge sites, Greenspot is closer to the BBARWA WWTP and its hydrogeological conditions are well understood. The phased project assumes the same brine management strategy, RW blending requirements and underflow credits, as previously stated for Alternative 4.

For the phased approach to Alternative 4, 16,200-ft of 12-in. pipeline, a 275 gpm pump station and a 0.40 MG onsite RW storage tank are required to convey the RW to Greenspot. The 12-in. pipeline to Greenspot would have sufficient capacity to deliver the remainder of the Greenspot recharge capacity once additional phases of the project are implemented. Assuming the same blending requirements (22% tertiary/78% advanced) and 100 AFY of underflow credits, the tertiary and advanced treatment systems would be sized for 0.45 MGD and 0.36 MGD, respectively. To artificially recharge 440 AFY, only 3.5-acres of the Greenspot recharge site would need to be developed and it is assumed that 3 new production wells would be used to recover the water. It is assumed 2 monitoring wells would be sufficient for groundwater sampling.

The 25% capacity target for the first phase is intended to reduce capital costs while maintaining an appreciable beneficial use yield to provide a measurable water supply benefit (440 AFY is equivalent to roughly 10-15% of the Big Bear Valley's potable water demand). The 440 AFY capacity was also selected to allow for more manageable modular expansions of the tertiary and advanced treatment systems, which can be expanded upon with identically sized facilities at 25% increments until full capacity is reached.

It is estimated the operation and maintenance of the facilities associated with a phased Alternative 4 implementation would require 1.5 FTE.

This phased approach to implementation of Alternative 4 significantly reduces the capital cost required to initiate an artificial recharge project in the Valley. The unit cost of the RW would be high for the first phase of implementation; however, the facilities constructed in the first phase would remain in use during latter phases, which will reduce the unit cost as facility capacity is increased in the future.

5.1.4.6.2 Demonstration Recharge Project at Greenspot

Demonstration projects are common in the water-wastewater industry because they provide an opportunity for community education, establish proof of concept and promote local buy-in of the project. The Greenspot recharge site is close to schools in the Big Bear Valley, offering great educational opportunities for teaching students the value of water and the science behind artificial groundwater recharge. The small scale also gives operators the opportunity to learn about IPR processes and monitoring requirements with smaller facilities, which are more easily managed than full-scale systems.

The demonstration project includes purchasing a skid-mounted tertiary and advanced treatment system and delivering RW to the demonstration Greenspot recharge site using water tanker trucks. Deferring the construction of a 12-in pipeline to the Greenspot site would save approximately $5 million in capital costs and $32,000 in annual O&M of the pipeline. It is assumed the low volume of the brine stream from the advanced treatment system would not require volume reduction through brine treatment processes, saving another $17 million in capital costs.

The treatment system would be sized to provide a RW yield of 50 AFY. Assuming two operators would operate 8,000-gallon capacity water trucks to transport RW to the Greenspot Site 5 days a week for 39 weeks out of the year (9-month recharge schedule), the advanced treatment system would need to produce approximately 80,000 gpd. The appropriate proportions of tertiary and advanced treated water will be treated at the existing BBARWA WWTP and blended in an onsite recycled water tank. A fill station with a small booster pump would be constructed near the recycled water tank for the water trucks to collect the recharge water. For this short term, small scale demonstration project, it is assumed that the brine could be blended with secondary effluent and delivered to the Lucerne Valley Site for irrigation water. As the capacity of the advanced treatment system and the groundwater recharge facilities increase with future expansions, the brine management strategy would shift to effluent mixing coupled with brine reduction and evaporation ponds, as described in Section 5.1.2.1 for Alternative 2.

The demonstration Greenspot Recharge Site is assumed to be 0.7-acres to allow for more than 0.5-acres of area for surface water spreading and sufficient space for maintenance access and berms. It is assumed 1 extraction well with 100 gpm capacity will be constructed downgradient of the Greenspot Recharge Site. To avoid the stranded assets in future expansions of the project, this well would have 100 gpm capacity to be consistent with the full-scale recharge application. As recharge volume increases in later phases of the project, the remaining five wells would need to be constructed.

In addition to the 2 FTE water truck operators, it is estimated that 0.75 FTE are required for operation and maintenance of the advanced treatment systems and the recharge facilities. The capacity selected for the advanced treatment plant and the recharge facility must align with manufacturer specifications for skid-mounted advanced treatment systems. Also, the quantity of water delivered to the recharge site is dependent on the size of the water tank truck and the staffing available for operation of the truck.

Due to the small size and skid mounted design of the demonstration scale treatment equipment, it may be difficult to incorporate this equipment into a future larger scale expansion of the treatment system, resulting in two separate treatment systems, or possibly the abandonment of the demonstration scale equipment. While minimizing the initial capital investment, this scenario does not provide significant improvements that can be easily expanded for future phases.

5.2 NON-RECYCLED WATER ALTERNATIVE

BBLDWP previously evaluated a supplemental water supply concept to provide imported water to the Valley. In June 2005, Camp Dresser & McKee, Inc. (CDM) prepared a cost estimate for a pipeline from Lucerne Valley to Big Bear Lake by way of the Morongo Pipeline. In a previous report by CDM from December 2004, it was determined that the most cost-effective path for the pipeline was along Highway 18. It was assumed that 1,000 AFY of water would be conveyed to the Valley for the purposes of estimating costs for imported water purchase, treatment plant capital and operation and maintenance costs, and the pipeline and booster pumps capital and operation and maintenance costs. For the purposes of comparison in this study, the capital and O&M costs assumed in the CDM analysis were escalated to the cost basis of this Study. The estimated unit cost for this imported water concept is $5,630/AF. However, the Big Bear Agencies do not currently have supply contracts with any State Water Contractors and it may not be possible to secure them. Additionally, State Water Project water deliveries have declined in recent years and are subject to further reductions based on environmental and hydrologic factors. An imported water supply would not be a sustainable or drought proof supply for the Valley.

5.3 NO PROJECT ALTERNATIVE

The No Project Alternative would not require any upgrades to the BBARWA WWTP and the secondary effluent would continue to be discharged outside of the Valley for crop irrigation in the Lucerne Valley. The No Project alternative would not provide any benefits to the Valley.

5.4 WATER CONSERVATION/REDUCTION ANALYSIS

In order to meet conservation targets and the recent drought mandates, BBLDWP and BBCCSD have pursued multiple water use efficiency measures and actions, including water use restrictions and multiple water conservation incentive programs. The current Demand Management Measures implemented by each agency are summarized in Table 5-11. As shown in Figure 2-2, water demands have declined significantly since 2013 as a result of these conservation efforts.

Table 5-11 Demand Management Measures Implemented by BBLDWP and BBCCSD

Retail Agency Demand Management Measure	BBLDWP Measures (4)	BBCCSD Measures (8)
Water Waste Prevention Ordinances	Water Conservation Program Policy No. 2014-02 includes several indoor and outdoor water waste prevention policies.	Ordinance No. 2016-05 imposes water waste prohibitions for increasingly stringent water-supply shortage stages
Metering	Initiated Advanced Metering Infrastructure project to better track water system demands in real time and measure the effects of conservation measures.	Currently, all water services are metered and Ordinance Nos. 29 and 4S were enacted to declare foals pertaining to water meters
Conservation Pricing	Applies tiered rate structure to encourage minimization of water use.	Applies tiered rate structure to encourage minimization of water use.
Public Education and Outreach	Conducts water supply and conservation public education through local newspapers, social media and radio advertisements and manages a Xeriscape Demonstration Garden to provide ideas for residential drought tolerant landscape.	Conducts water conservation education and outreach through public water conservation awareness program and sponsors the local Xeriscape Demonstration Garden.
Distribution System Real Loss Management Program	The DWP conducts regular mass balance audits of metered water production versus metered water sales to detect unusual changes in the water operation, and performs hydraulic modeling to identify existing system deficiencies.	Staff performs regular inspections or contracts leak detection companies to check for system leaks. Completed AWWA Water Audit for 2015.
Water Conservation Program Coordination	Employs one full-time staff person as Water Conservation and Public Information Specialist and one part-time Water Conservation Technician to manage the responsibilities of the water conservation program.	BBCCSD's conservation program is managed by the Water Department Superintendent with support from Water Department Staff. The shared responsibilities are equivalent to a full-time conservation coordinator's responsibilities
Other	Offers indoor conservation consults/audits, landscape surveys, turf buyback programs and provides rebates to customers for performing high efficiency appliance retrofits	Reviews effectiveness of demand management measures by continually observing water production and usage. Educational outreach directed at younger customers to encourage continued future water conservation.

Outdoor water use conservation measures would reduce the irrigation demands that could be served with recycled water under Alternative 1. This would result in a lower potable water offset and a higher cost per AF of recycled water put to beneficial use.

Indoor water use conservation measures would reduce wastewater generation and would result in a lower recycled water production volume that can be put to beneficial use for groundwater recharge alternatives; this may result in a higher cost per AF of recycled put to beneficial use.

Implementation of private greywater systems would decrease wastewater generation, as well as water consumption. BBLDWP estimated 600 AFY would be saved if their customers used greywater to irrigate their landscaping (4). While greywater systems provide an opportunity to increase the sustainable use of resources, widespread implementation in the Big Bear Valley would have an impact on the volume and strength of wastewater available for future reuse projects. The greatest barrier to implementation of greywater systems in existing buildings is the user conversion costs. Greywater system conversions require plumbing modifications inside and outside the building and construction of a treatment system. Typically, greywater systems are implemented at sites with new construction where the treatment system and plumbing connections are constructed concurrently with the structure.

5.5 ALTERNATIVES ANALYSIS

5.5.1 Qualitative Evaluation Criteria

Each alternative was screened using the following qualitative screening criteria:

- Promotes Beneficial Management of Water Resources
- O&M Complexity
- Ease of Implementation
- Benefit to the Valley Community

Each criterion has a corresponding scoring approach. The scoring approaches and definition of each criterion are provided in Appendix H. The scoring approach was then weighted based on the importance of the criteria to the project's goals and objectives. For each alternative, the weighted score for the screening criteria was summed to find the qualitative total. Finally, each alternative was ranked based on the qualitative score total.

5.5.2 Quantitative Analysis Summary

Each alternative was compared based on unit cost and recycled water yield. Table 5-12 summarizes the results from the quantitative comparison. For the purposes of the alternatives evaluation, only Segment 1.1 of Alternative 1 was included because it has the lowest unit cost and does not rely on highly uncertain customers such as the gold course. For Alternative 3, the Low Range cost was included in the evaluation for simplicity, although the High Range cost would not change the overall ranking.

Table 5-12. Recycled Water Alternatives Quantitative Analysis Summary

Alternative	Alternative 1 Irrigation (Segment 1.1)	Alternative 2 Greenspot	Alternative 3 Sand Canyon (Low Range)	Alternative 3 Sand Canyon (High Range)	Alternative 4 Greenspot & Sand Canyon
Total Capital Cost	$3,257,000	$44,533,000	$23,255,000	$24,315,000	$69,700,000
Annual O&M Cost	$65,000	$1,539,000	$1,174,000	$1,259,000	$2,726,000
Recycled Water Yield (AFY)	54	1,000	520	500	1,750
Unit Cost ($/AF)	$3,960	$3,580	$4,310	$4,750	$3,390
Net Present Value	$5,087,000	$88,172,000	$56,759,000	$60,247,000	$147,270,000

5.5.3 Alternative Ranking Criteria and Scoring Results

For the alternative analysis, each alternative was compared and ranked on the basis of qualitative criteria, beneficial use yield and unit cost. Each alternative received a ranking between 1 and 3. The ranking system is summarized in Table 5-13.

Table 5-13. Alternative Ranking Criteria

Criteria	Ranking of 1	Ranking of 3
Qualitative	Lowest weighted score	Highest weighted score
Unit Cost	Lowest Unit Cost	Highest Unit Cost
Water Available for Beneficial Use	Largest Recycled Water amount used	Smallest Recycled Water amount used

As shown in Figure 5-14, Alternative 4 ranked first in the two of the three alternative ranking criteria categories and highest overall; therefore, Alternative 4 was selected as the top ranked alternative. Alternative 1 ranked the lowest.

5.5.4 Preferred Alternatives

Alternative 4 was highest ranked and is recommended for implementation as the ultimate project, although it can be implemented in phases over time. At full scale, Alternative 4 would beneficially use nearly all of the treated effluent within the Valley.

	Assigned Scores (1, 2 or 3; 3 being the best)					Weighted Scores (Assigned Scores x Weighting Factors)			
Qualitative/Non-Economic Criteria	**Alternative 1 (Segment 1.1)**	**Alternative 2**	**Alternative 3 (Low Range)**	**Alternative 4**	**Weighting Factors** (1-4, 4 being most important)	**Alternative 1 (Segment 1.1)**	**Alternative 2**	**Alternative 3 (Low Range)**	**Alternative 4**
Promotes Beneficial Management of Water Resources	1	2	3	3	3	3	6	9	9
O&M Complexity	3	2	2	1	2	6	4	4	2

Figure 5-14. Alternative Evaluation Results

6 RECOMMENDED FACILITIES PROJECT PLAN

As discussed in Section 5.5, Alternative 4 was ranked the highest and is the recommended alternative for implementation. There is sufficient treated effluent available to provide RW for artificial recharge at both Greenspot and Sand Canyon.

As described in Section 5.1.4.6, a demonstration scale or phased project may be considered for the Alternative 4 implementation. Greenspot has been thoroughly studied and modeled; therefore, there is little risk in establishing the Greenspot site to initiate the Valley's RW program. A phased approach to implementing 25% of the Valley's potential RW use yield sets the agencies up for modular expansion to eventually reuse all the potential RW, while maintaining all assets for use in later phases. Due to the low beneficial use yield of the demonstration project and the likelihood for stranded assets due to the small scale, it is recommended the agencies pursue a phased Alternative 4 project rather than a demonstration scale project if the potential refinements to Alternative 4 were to be considered.

6.1 RECYCLED WATER YIELD

The potential recycled water yield of Alternative 4 is summarized in Table 6-1.

Table 6-1. Summary of Alternative 4 Recycled Water Yield

Alternative	Potential Water Use, AFY
Alternative 4 – Greenspot & Sand Canyon Recharge	1,750

6.2 TREATMENT IMPROVEMENTS

A portion of the flow will require advanced treatment to meet recycled water blending requirements and to comply with groundwater quality objectives. The advanced treatment process train would consist of:

1. MF/UF
2. RO
3. UV/AOP
4. Brine Disposal

The combination of MF, RO and UV/AOP is considered the conventional indirect potable reuse treatment train.

The brine stream generated from the RO process in Alternative 4 would be treated and disposed of using effluent mixing coupled with brine reduction and evaporation ponds at the LV Site. Alternatively, the Project Team has expressed an interest in exploring the concept of constructing brine storage and evaporation ponds on the BBARWA WTP site to avoid the cost of the brine pipeline to the LV Site. As previously stated, this brine management strategy must be reevaluated following issuance of the new LV Site TDS limit. The issuance of the TDS limit will occur after the approval of the TDS study, which is due to the State Board by December 31, 2017.

The treatment capacity of Alternative 4 is summarized in Table 6-2.

Table 6-2. Treatment Capacity Summary for Alternative 4

Alternative	Tertiary Treatment		Advanced Treatment		Total Blended Water Produced, MGD
	Capacity, MGD	% of Total Recharge Water	Capacity, MGD	% of Total Recharge Water	
Alternative 4: Greenspot & Sand Canyon Recharge	1.78	22%	1.43	78%	1.56

6.3 RECHARGE AND DISTRIBUTION IMPROVEMENTS

Alternative 4 requires construction of an onsite storage tank, a water truck fill station and recharge facilities. A summary the improvements is presented in Table 6-3. A map of Alternative 4 is shown in Figure 6-1.

Table 6-3. Alternative 4 Facilities Summary

Facility	Capacity
Storage, MG	1.56
Pump Station, gpm	1,100
Pipeline (length, ft/dia)	50,200 / 12”
Recharge Basin, acres	9.5
New Extraction Wells	6
New Monitoring Wells	4

6.4 COST ESTIMATE

The cost estimate for Alternative 4 is summarized in Table 6-4.

Table 6-4. Cost Summary for Alternative 4

Alternative	Capital Cost	O & M Cost	Recycled Water Yield, AF	Unit Cost, $/AF	Net Present Value
Alternative 4: Greenspot & Sand Canyon Recharge	$69,700,000	$2,726,000	1,750	$3,390	$147,936,000

The SWRCB Water Recycling Funding Program received funding from the 2014 California Water Bond (Prop 1) and is currently offering grant funding for water recycling projects. This grant program, which is described in more detail in Section 8.2.1, is offering 35% grants, with a maximum grant amount of $15,000,000. To illustrate the benefits of this grant program, Table 6-5 summarizes the local portion of the project costs if a 35% grant is received to reduce the local capital contribution.

Table 6-5. Cost Summary Including 35% Grant for Alternative 4

Alternative	Capital Cost	O & M Cost	Recycled Water Yield, AF	Unit Cost, $/AF	Net Present Value
Alternative 4: Greenspot & Sand Canyon Recharge	$45,305,000	$2,726,000	1,750	$2,750	$124,180,000

There may be opportunities to leverage other grant funding programs, such as the USDA Rural Development Water and Environment Program, to further reduce the portion of project costs that must be funded locally.

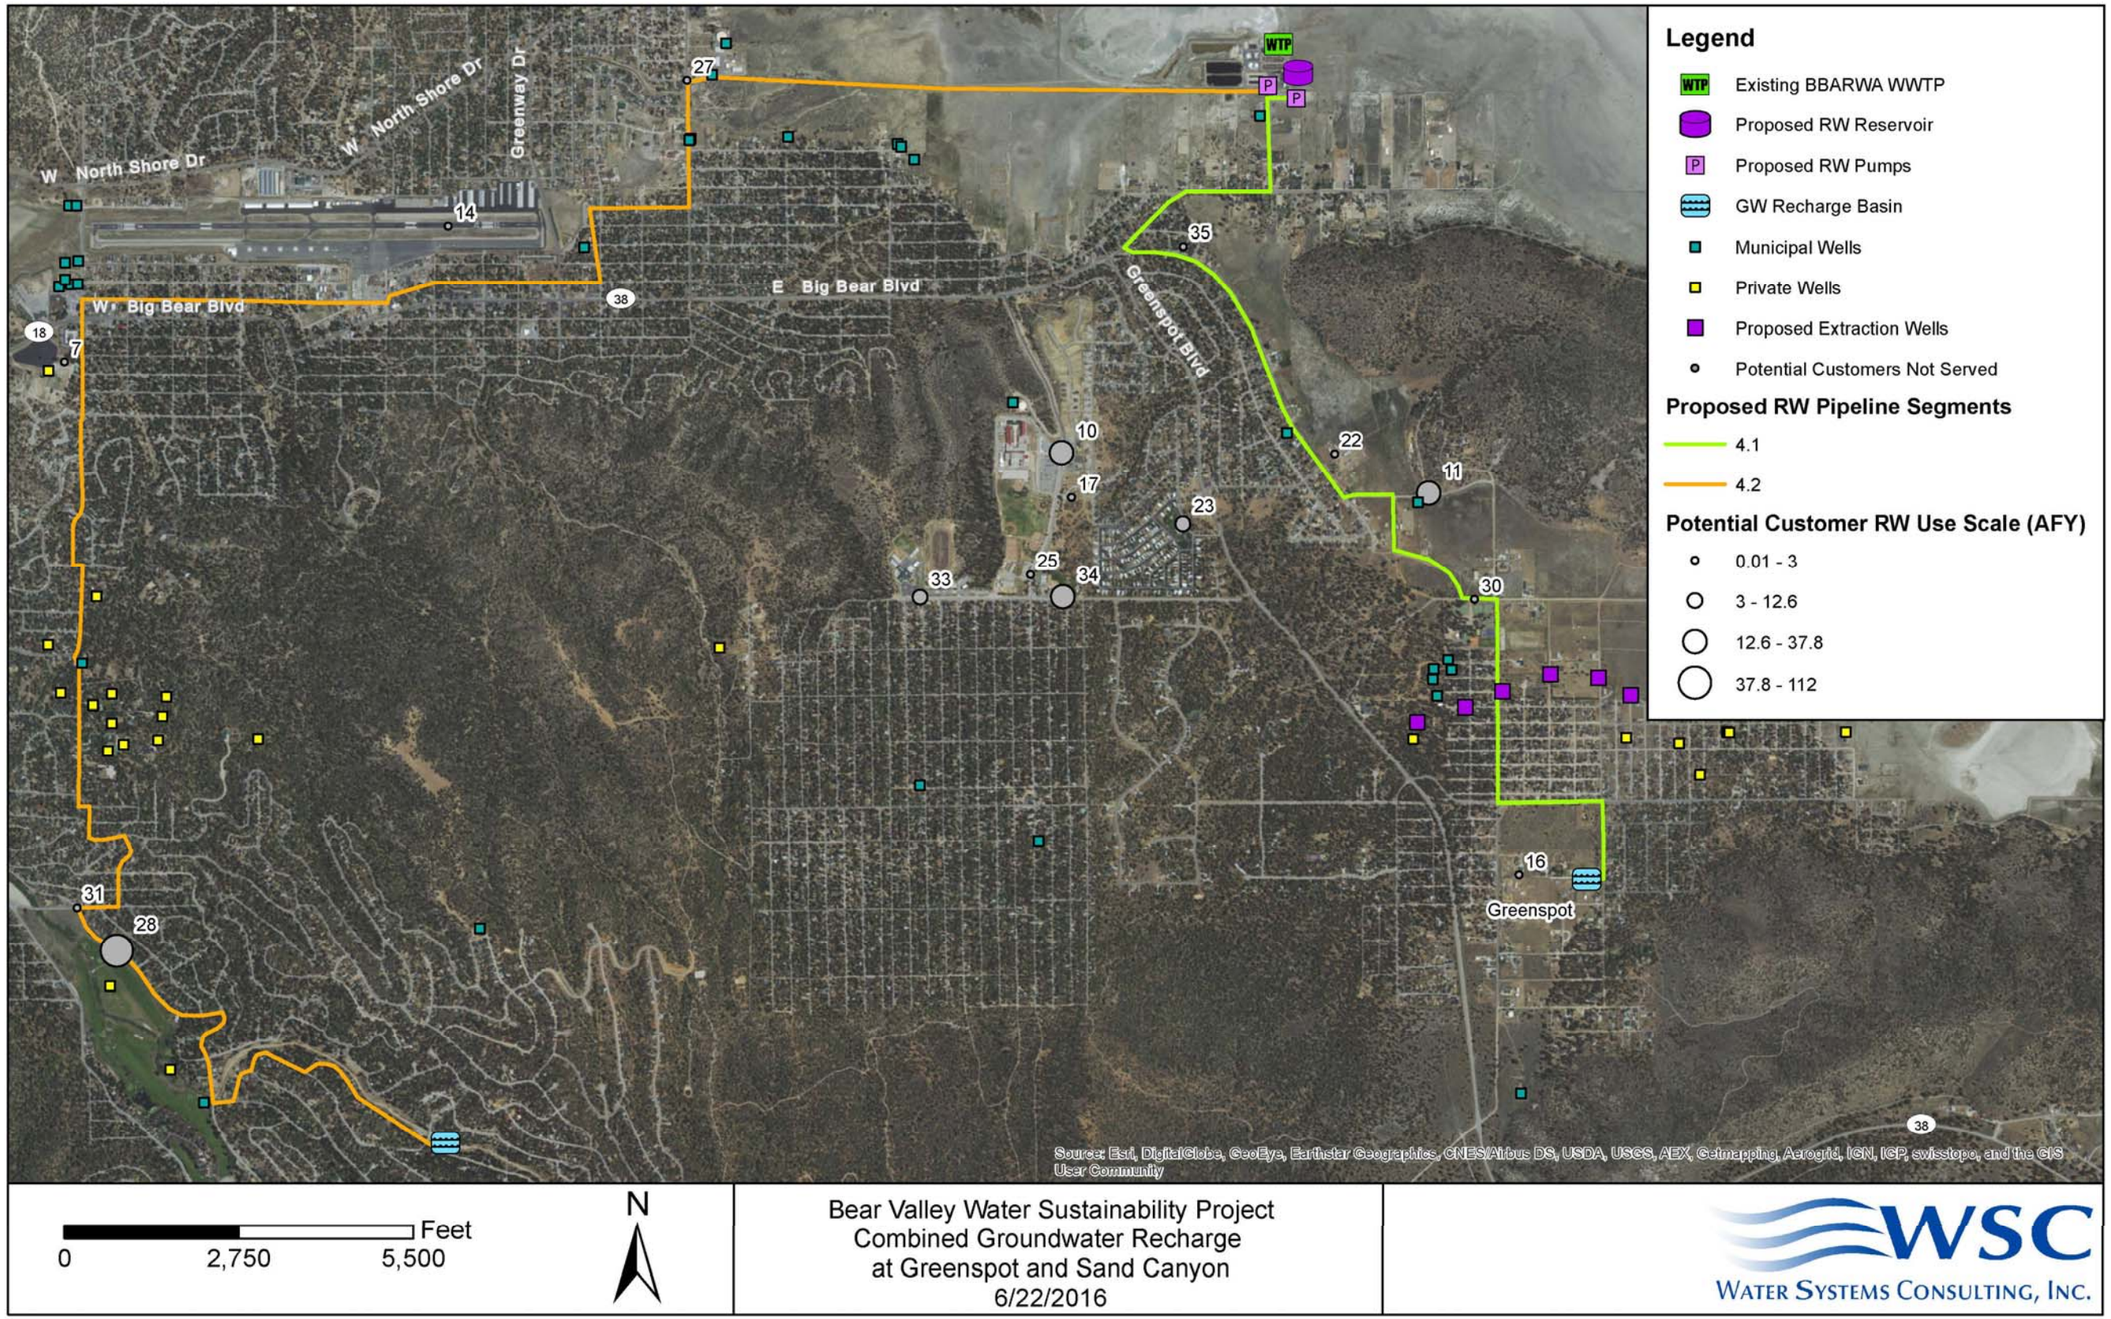

Figure 6-1. Alternative 4 Overview

7 IMPLEMENTATION PLAN

This Chapter describes what the Project Team will need to consider and address when implementing the selected recycled water project(s).

7.1 NEXT STEPS FOR IMPLEMENTATION

The next steps towards the implementation of the recommended groundwater recharge projects are summarized below. The next steps apply to both the Greenspot and Sand Canyon recharge projects unless otherwise stated.

- Quantify dilution credit
  - Sand Canyon Site will require a complete hydrogeologic analysis in order to quantify credits
  - Greenspot Site will require an update to the prior hydrogeologic analysis using the existing groundwater model
- Coordinate with the SAWPA BMPTF to assess assimilative capacity for TDS
- Perform a brine analysis for the Sand Canyon recharge alternative to confirm whether brine generated at the satellite facility could be discharged to the BBARWA plant without impacting the ability to meet discharge requirements
- Target optimization of brine management at the existing BBARWA WWTP by evaluating:
  - alternative treatment technologies for a portion of the advanced treatment to minimize brine produced
  - new and emerging technologies that could reduce brine disposal costs
  - local brine evaporation scenarios and sites
- Perform additional field investigations and perform groundwater model analysis for the Sand Canyon Site to explore operational scenarios and the impact on groundwater levels and travel time
- Perform additional modeling for the Greenspot Recharge Site to further explore operational scenarios and validate the number of new production wells needed.
- Public outreach to enhance public engagement and support for the project
- Outreach to public universities and Water Environment & Reuse Foundation to discuss potential partnering opportunities for inland potable reuse research.
- Establish monitoring system for funding program solicitations related to demonstration recycled water projects.

7.2 PERMITTING REQUIREMENTS

7.2.1 Tentative Water Recycling Requirements of the Santa Ana RWQCB

In order to implement the recommended recycled water projects, BBARWA will need to initiate a permit reopener and renewal process with the Santa Ana RWQCB to obtain coverage for the proposed advanced treatment upgrades, waste effluent discharge and recharge. BBARWA will need to submit a Report of Waste Discharge to the Santa Ana RWQCB and an Engineering Report to Santa Ana RWQCB and DDW. The Engineering Report will need to include:

- Description of the proposed advanced treatment at the WWTP
- A hydrogeological assessment of the proposed Groundwater Replenishment Reuse Project (GRRP's) setting, including:
    - a general description of geologic and hydrogeological setting of the groundwater basin(s) potentially directly impacted by the GRRP;
    - a detailed description of the stratigraphy beneath the GRRP, including the composition, extent, and physical properties of the affected aquifers; and
    - based on at least four rounds of consecutive quarterly monitoring to capture seasonal impacts:
        - the existing hydrogeology and the hydrogeology anticipated as a result of the operation of the GRRP
        - maps showing quarterly groundwater elevation contours, along with vector flow directions and calculated hydraulic gradients.
- A map of the GRRP site showing (1) the location and boundaries of the GRRP; (2) a boundary representing a zone of controlled drinking water well construction based on required retention times, (3) a secondary boundary representing a zone of potential controlled drinking water well construction, depicting the zone within which a well would extend the boundary in paragraph (2) to include existing or potential future drinking water wells, thereby requiring further study and potential mitigating activities prior to drinking water well construction; and (4) the location of all monitoring wells and drinking water wells within two years travel time of the GRRP based on groundwater flow directions and velocities expected under GRRP operating conditions
- Justification of the required Response Retention Time and a protocol to be used to establish the required retention times
- A protocol describing the actions to be taken following construction of the upgrades to demonstrate that all treatment processes have been installed and can be operated to achieve their intended function
- Demonstration that the project sponsor possesses adequate managerial and technical capability to assure compliance with the regulations
- An emergency response plan for an alternative source of potable water supply or treatment at a drinking water well if the GRRP causes the well to no longer be safe for drinking purposes
- A contingency plan which will assure that no untreated or inadequately-treated wastewater will be delivered to the use area

Water recycling requirements for the GRRP will be in accordance with the Groundwater Recharge Regulations and are anticipated to include the requirements presented in Table 7-1. Figure 7-1 illustrates the anticipated Santa Ana RWQCB permitting process required.

Table 7-1. Tentative Water Recycling Requirements

Element	Surface Recharge
Treatment	RO and AOP treatment to meet blending and/or Basin Plan requirements
Retention time	Minimum 2 months
Recycled Water Max Initial Contribution (RWC_{max})	Up to 100% with RO and AOP
Total Nitrogen	Average < 10 mg/L
Total Organic Carbon (TOC)	< 0.5 mg/L
Monitoring Wells	2 monitoring wells down gradient of the GRRP

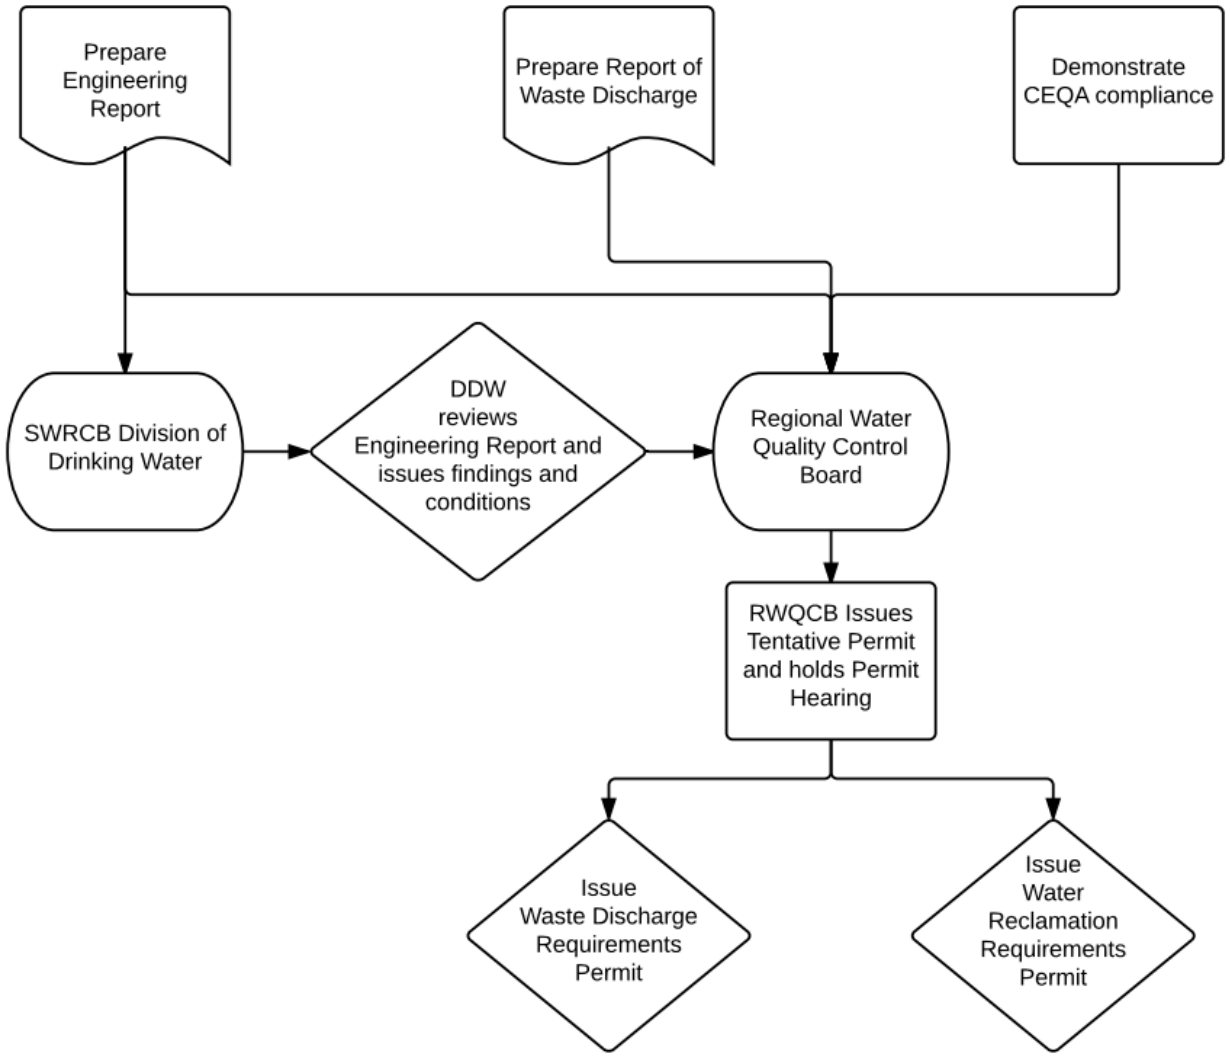

Figure 7-1. Permitting Process

Prior to the operation of the GRRP, the Project Team will also be required to develop and implement the following:

- An industrial pretreatment and pollutant source control program and maintain a source control program. As a component of the source control program, an outreach program to industrial, commercial, and residential communities discharging to the WWTP will be needed for the purpose of managing and minimizing the discharge of chemicals and contaminants at the source.[1]
- An Operation Optimization Plan which identifies and describes the operations, maintenance, analytical methods and monitoring necessary for the GRRP to meet the requirements of the Groundwater Recharge Regulations.

7.2.2 Infrastructure Permits

It is anticipated that the Project Team will need to obtain multiple permits to construct the recommended projects including, but not limited to, the following:

- Caltrans encroachment permits for pipeline with Caltrans Right-of-Way
- The City of Big Bear Lake and/or San Bernardino County encroachment permits for improvements within their Rights-of-Way
- Grading permits for treatment upgrades, recharge basins, and extraction well sites
- NPDES General Construction Permit
- Building permits
- Authority to Construct and Permit to Operate the WWTP upgrades from the South Coast Air Quality Management District

7.3 ENVIRONMENTAL DOCUMENTATION REQUIREMENTS (CEQA)

In accordance with the California Environmental Quality Act (CEQA), it is anticipated the Project Team will prepare an Initial Study (IS) followed by an Environmental Impact Report (EIR) for the recommended project. In anticipation of applying for federal funding sources, the Project Team may also prepare an Environmental Assessment (EA) and an Environmental Impact Statement (EIS) to comply with the National Environmental Policy Act (NEPA).

[1] It is anticipated BBARWA's existing Ordinances No. 69 & O.03-2002 may be used to demonstrate compliance with the requirements of both programs.

7.4 BENEFICIARIES

The beneficiaries of this project include potable water customers of the BBLDWP, BBCCSD and private well pumpers in the Valley. The potable water users benefit from a new source of supply which is local, sustainable and highly reliable, even in times of drought.

Wastewater disposal for the BBARWA's wastewater customers is currently being achieved effectively through treatment and discharge to the Lucerne Valley Site for crop irrigation; therefore, the wastewater customers are not considered a beneficiary of this project. Although no significant near term changes are anticipated to the Colorado WDR that regulates this discharge, it is foreseeable that water quality and resulting treatment requirements will become more stringent in the future as more constituents are regulated and/or detection levels are lowered. In this situation, the wastewater customers would also receive benefits from the treatment upgrades proposed by the recommended project.

7.5 COORDINATION AND GOVERNANCE

It is recommended the Project Team continue discussions with each other regarding funding, financing and cost sharing for subsequent planning and design activities as well as fixed and variable project costs.

7.6 PUBLIC OUTREACH

Depending on the relative public acceptability of a GRRP, there may be a need for a public information program, which could take many different forms. It is recommended that the Project Team engage in a proactive public outreach program in coordination with other existing or planned outreach programs.

8 CONSTRUCTION FINANCING PLAN AND ANNUAL OPERATING BUDGET

Planning a recycled water program and building recycled water infrastructure requires a significant upfront capital investment. Additionally, adequate funding for annual O&M is necessary to ensure successful operation. Developing and implementing a recycled water program will require the project partners to develop a sound financial plan.

It is anticipated that the project will be funded through a combination of grants, low interest loans, cost-sharing contributions from the Project Team, and potentially other mechanisms.

8.1 ANNUAL OPERATING BUDGET

Table 8-1 summarizes the potential annual capital payment (based on 100% loan) and O&M costs for the recommended recharge projects.

Table 8-1. Estimated Project Annual Cost

	Greenspot & Sand Canyon Recharge
Annual Capital Payment	**$ 3,198,000**
Annual O&M Cost	
Pipeline	$ 100,000
Storage	$ 20,000
Pump Station Maintenance	$ 37,000
Pump Station Power	$ 111,300
Tertiary Treatment	$ 226,000
Advanced Treatment	$ 994,000
Brine Management System	$ 1,113,000
Compliance for Recycled Water	$ 76,250
Recharge Basin	$ 48,000
Total Annual O&M	**$ 2,726,000**
Total Annual Cost	**$ 5,924,000**

8.2 FUNDING OPPORTUNITIES

Pursuing project funding will require an upfront investment by the Project Team, and grant funding is anticipated to be highly competitive. The recommended recycled water project is anticipated to be attractive to grant funding agencies because it meets several objectives commonly prioritized by funding programs, including:

- Relies upon and strengthens local and regional partnerships
- Develops a new, local, sustainable water supply that benefits regional communities
- Improve water supply reliability
- Improves groundwater basin quality

The following sections present potential grant and loan funding opportunities that may be available for the project, including the recently approved 2014 California Water Bond (Prop 1).

8.2.1 Grant and Loan Programs

Funding opportunities for recycled water projects are available from several state and federal sources, including the SWRCB, Department of Water Resources (DWR), United States Bureau of Reclamation (USBR), USDA, California Energy Commission (CEC), and the U.S. Environmental Protection Agency (EPA). Several of these programs are responsible for administering the funds made available by the 2014 Water Bond (Prop 1). Funding programs are available to fund project activities from preliminary planning to construction. A summary of eligible funding programs is presented in Table 8-2.

Table 8-2. Eligible Funding Programs

Funding Program	Applicability to BVWSP	Available Funding	Project Deadlines	DAC Eligibility	Application Schedule	Reimbursable Funds Prior to Start Date	Required Documents
WFRP-Construction Grant/Loan Program	Funding for construction of water recycling projects	Grants up to 35% up to maximum of $15 million. Loans/financing available for 100% of eligible costs. Repayment term up to 30 years. Interest rate is set to half of the most recent General Obligation bond rate.	Total eligible project capacity shall be delivered within 5 calendar years of operation from the date of Initiation of Operations 50% of eligible project capacity must serve existing users	A **small** DACs may receive up to 40% in grants up to $20 million[1]	Applications are accepted on a continuous basis	The applicant may satisfy the local match requirement through other sources, including its own revenues, for example, where it has incurred and paid costs for studies and other directly associated planning and design incurred prior to the grant award date	CEQA
CWSRF-Wastewater Treatment Projects and Recycling Funding	Low interest financing for wastewater treatment facilities. Construction of publically owned treatment facilities. Wastewater treatment, local sewers, sewer interceptors, water reclamation, storm water treatment, combined sewers	30-year financing term at interest rate set to half of the most recent General Obligation bond rate[2]	No specific project timeline. Projects prioritized by "Readiness to proceed"	No preference/requirement for DAC	Applications are accepted on a continuous basis	Applicants may start construction prior to the effective date of the financing agreement, but will not receive reimbursement of construction costs incurred prior to the effective date, and are not guaranteed financing approval and an executed financing agreement.	CEQA+
USDA Rural Development-Water & Waste Disposal Loan & Grant Program	Funding for acquisition, construction or improvement of sewer collection, transmission, treatment and disposal facilities.	Up to 40-year financing term with fixed interest rates dependent on median household income and need for project. State or local match of 25% required. Grants may be combined with loans.	No specific project timeline.	DAC preferred/no requirement for DAC. Financing terms dependent on community MHI.	Applications are accepted on a continuous basis	Any costs including design, engineering during construction, construction, legal fees and land acquisition incurred prior to the date of award must be submitted to the USDA in writing to be considered for reimbursement.	NEPA
USBR WaterSMART Water and Energy Efficiency Grant	Project can demonstrate a benefit to an endangered threatened species, and reduce water and energy consumption. Would support alternatives for groundwater recharge	Funding Group I: Up to $300,000 up to two years. Funding Group II: Up to $1,500,000 up to three years	2 Years for Funding Group I. 3 Years for Funding Group II	No preference/requirement for DAC	Deadline has passed for 2016 grants. Application released between October-December, and due approximately 3 months after release date. Applicants should receive funding by summer of the following year	Any costs including design, construction plans, environmental compliance costs incurred prior to the date of award may be submitted for consideration for reimbursable expense	NEPA
USBR WaterSMART Title XVI Water Reclamation and Reuse Program	Funding for construction of projects that reclaim and reuse. Reclaimed water can be used for a variety of purposes such as environmental restoration, fish and wildlife, groundwater recharge, municipal, domestic, industrial, agricultural, power generation, or recreation	Financing for construction projects is less than $20 million or 25% of total project cost. Funding for projects approved by congress and sponsored by congressman. 6 years since last construction authorization.	Typically, 24-36 months to complete tasks in agreement[5]	No preference/requirement for DAC	Deadline has passed for 2016 grants. Application released between October-December of this year. Applications due approximately 3 months after release date. Applicants should receive funding by summer of the following year	Any costs including design, construction plans, environmental compliance costs incurred prior to the date of award may be submitted for consideration for reimbursable expense	NEPA
USBR WaterSMART Title XVI Water Reclamation and Reuse Program	Funding for planning/feasibility study for recycled water project. Reclaimed water can be used for a variety of purposes such as environmental restoration, fish and wildlife, groundwater recharge, municipal, domestic, industrial, agricultural, power generation, or recreation	Federal share for 50% of Feasibility Study	Typically, 18 months to complete tasks in agreement[3]	No preference/requirement for DAC	Deadline has passed for 2016 grants. Applications likely to be released in January of 2016	Any costs including design, construction plans, environmental compliance costs incurred prior to the date of award may be submitted for consideration for reimbursable expense	NEPA
Integrated Regional Water Management (IRWM) - Implementation Grant Program	Provides funding for implementation projects that support integrated water management	Minimum local funding match of 25%	No specific time to completion listed. Project must be implementation ready to apply for funding	MHI<80% of Statewide annual MHI	Deadline has passed for 2016 grants. Applications for 2017 likely to be due August 2016, and awarded January 2017	Reimbursable funds after effective date are for engineering, design, land and easement, legal fees, preparation of environmental documentation, environmental mitigation, and project implementation. Grant application preparation prior to effective date is reimbursable	CEQA
I-Bank Infrastructure State Revolving Fund	Provide financing for infrastructure and economic development projects	$50,000 - $25 million. Most recent interest rates between 2-3%	No specific time to completion listed. Project must be implementation ready to apply for funding	No DAC requirement; staff may adjust interest rate based on factors including MHI on a case by case basis	Continuous application process		CEQA

Notes:
1. Eligible communities include those with a population <20,000. Disadvantaged Communities (DAC) are those with MHI<80% of Statewide MHI. Severely DACs are those with MHI<60%.
2. Current CWSRF interest rate is 1.7%, 10 year range of 2.5% to 3%. No funding limit.
3. Extensions are allowed on a case-by-case basis.

9 CONCLUSIONS AND RECOMMENDATIONS

The implementation of a Bear Valley Water Sustainability Project that retains highly treated water in the Valley for beneficial use would provide a sustainable and drought proof source of supply that would support current and future residents and businesses long into the future. However, even with taking advantage of current funding programs, such a project would represent a significant investment for the community. The costs and long term benefits to the community should be carefully considered when determining the timing for implementation of the Bear Valley Water Sustainability Project.

Key next steps towards the implementation of the recommended groundwater recharge project were identified in Section 7.1. At a minimum, it is recommended that the Project Team consider the following two activities to continue to build a foundation for the potential future implementation of a groundwater recharge project.

- Coordinate with the SAWPA BMPTF regarding the assimilative capacity assessment process for TDS and consider adding the Big Bear Valley Groundwater Management Zone to the periodic update process.
- Continue public outreach to enhance public engagement and support for a groundwater recharge project in the Valley.

Appendix A. WDR R7-2016-0026 and WDR R8-2005-004

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

BOARD ORDER R7-2016-0026

WASTE DISCHARGE REQUIREMENTS
FOR
BIG BEAR AREA REGIONAL WASTEWATER AGENCY, OWNER/OPERATOR
EXPORT OF RECYCLED WATER TO LUCERNE VALLEY
Lucerne Valley – San Bernardino County

The California Regional Water Quality Control Board, Colorado River Basin Region (Colorado River Basin Water Board) finds that:

1. Big Bear Area Regional Wastewater Agency (BBARWA or Discharger), P. O. Box 517, Big Bear City, California 92314, owns 480 acres in the Lucerne Valley, of which 340 acres are irrigated with recycled water from the Discharger's Wastewater Treatment Plant (WWTP). There are an additional 140 acres available for irrigation, also in the Lucerne Valley. BBARWA's WWTP provides sewerage service to the City of Big Bear Lake, Big Bear City Community Services District, and County Service Area 53-B. The WWTP is located at 122 Palomino Drive, Big Bear City, California 92314, and has a design treatment capacity of 4.89 million gallons-per-day (MGD) and a hydraulic capacity of 9.2 MGD.

2. The WWTP is located outside the boundary of the Colorado River Basin Water Board and is regulated by the California Regional Water Quality Control Board, Santa Ana Region (Santa Ana Water Board) under Waste Discharge Requirements (WDRs) Order R8-2005-0044.

3. The WWTP consists of: preliminary treatment, secondary treatment, and sludge drying and treatment. Secondary treated wastewater from the WWTP is disposed through three possible discharge points that are designated in Board Order R8-2005-0044 as Point 001, Point 002 and Point 003. The discharges from the WWTP at Points 002 and 003 are regulated by the Santa Ana Water Board. Most of the treated wastewater is discharged through Discharge Point 001 into the Lucerne Valley to irrigate fodder, fiber, and seed crops.

4. This Board Order regulates the discharge from the WWTP at Point 001. Infrastructure associated with this discharge includes a concrete-lined reservoir and two overflow ponds that are used to dispose of treated recycled wastewater by percolation and evaporation in the Lucerne Valley (Lucerne Valley Facility) located on Assessor's Parcel Number (APN) 0449-082-040000.

5. The Lucerne Valley Facility has been subject to WDRs adopted in Colorado River Basin Water Board Order 01-156 adopted November 14, 2001.

6. The WDRs are being updated to comply with current laws and regulations as set forth in the California Water Code (CWC) and the California Code of Regulations (CCR) and to incorporate any changes in ownership or operation undertaken by the Discharger.

7. The Lucerne Valley Facility is assigned California Integrated Water Quality System (CIWQS) number CW- CW-208930; Waste Discharger Identification (WDID) number 7A360100011, and GeoTracker Global ID number WDR100027897.

Wastewater Treatment and Discharge

8. The Lucerne Valley Facility is located on 480 acres owned by BBARWA and located near the intersection of State Hwy 247 (Old Woman Springs Road) and Camp Rock Road in the Lucerne Valley of San Bernardino County in Section 14, Township 4 North, Range 1 East, San Bernardino Base & Meridian, as shown in Attachment A, Vicinity Map, incorporated herein, and made part of this Board Order by reference.

9. Wastewater that is discharged at the Lucerne Valley Facility goes through preliminary and secondary treatment at the WWTP before it is sent via gravity to the concrete reservoir at the Lucerne Valley Facility. The WWTP components that are used for treatment are described below:

   a. Preliminary Treatment. Untreated wastewater flows to the preliminary treatment system, which consists of bar screens, aerated grit chamber with grit washer, and a flow bypass channel. This treatment stage removes screenings, rag material and grit.

   b. Secondary Treatment. Effluent flows by gravity from the preliminary treatment system to three parallel oxidation ditches for secondary (biological) treatment and timed processes for nutrient (nitrogen) removal. The number of ditches in operation depends on the seasonal fluctuations of the influent flow. The effluent from the oxidation ditches flows into a system of three secondary clarifiers for removal of floatable and settleable solids/materials. The secondary treated effluent flows to two cement-lined balancing chambers and then flows to equalization storage ponds at the WWTP until pumped for offsite irrigation disposal. A process flow diagram of the WWTP is shown on Attachment B, incorporated herein, and made part of this Board Order by reference.

   c. Offsite Irrigation/Disposal. Undisinfected secondary treated wastewater is pumped from the WWTP's main pump building (5.2 MGD) or auxiliary pump building (9.2 MGD) approximately 16.5 miles to an offsite 2.26-million gallon concrete-lined reservoir (undisinfected secondary recycled water reservoir). This reservoir is located one mile south of the irrigation site. Wastewater from the reservoir flows by gravity through an outfall line connected to the irrigation system. In the event of an overflow at the concrete-lined reservoir, the wastewater flows by gravity to earthen overflow ponds located adjacent to the irrigation site.

10. Approximately 2.01 MGD of undisinfected secondary recycled water (as defined in Title 22 California Code of Regulations Section 60301.900) is discharged to the Lucerne Valley Facility for irrigation of fodder and fiber crops. Undisinfected secondary wastewater has been approved by the California Department of Public Health (DPH) [now State Water Resources Control Board (SWRCB) Division of Drinking Water (DDW)] for irrigation use at this site. Approximately 340 acres are being irrigated at the Lucerne Valley Facility, with an additional 140 acres available for irrigation at the site. The effluent discharge limit of 4.8 MGD in this Board Order is based on the capacity of the irrigated crops to take up nitrogen. The Lucerne Valley Facility site layout is shown in Attachment C, incorporated herein, and made part of this Board Order by reference.

11. The SWRCB's Division of Drinking Water has established statewide reclamation criteria in Title 22 CCR Section 60301 et seq. for the use of recycled water and has developed guidelines for specific uses. Title 22 CCR Section 60304(d)(4) allows the use of undisinfected secondary recycled water for the surface irrigation of fodder and fiber crops and pasture for animals not producing milk for human consumption. BBARWA's Title 22

Engineering Report was initially approved on November 3, 1980, by the California DHS, (now DDW). The Title 22 report was last updated November 4, 1998, to allow for the use of tertiary treated wastewater in the Big Bear Area.

12. The grazing of sheep on the irrigation site has been allowed under certain conditions, as outlined in a letter from Colorado River Basin Water Board staff dated November 15, 1994, and under the conditions shown in Discharge Specification D.22 of this Order.

13. No sewage sludge is discharged at the recycled water reuse site.

14. BBARWA's Self-Monitoring Reports (SMRs) from April 2011 through March 2016 characterize the WWTP effluent as follows:

Constituent	Units	Average	Maximum	Minimum
Flow	MGD	2.01	4.18	1.42
20^{o} C BOD_5[1]	mg/L[2]	6	17	2
TSS[3]	mg/L	13	48	5
pH	s.u.[4]	7.8	8.0	7.4
TDS[5]	mg/L	450	519	354
Nitrate as N	mg/L	3.5	21.6	0.1
Total Nitrogen	mg/L	6.9	28	1.9
Chloride	mg/L	52	61	34
Sulfate	mg/L	40	48	26
Fluoride	mg/L	0.37	0.54	0.24
Boron	mg/L	0.18	0.25	<0.1

Hydrogeologic Conditions at the Lucerne Valley Facility

15. BBARWA installed one groundwater monitoring well in 1979 and three more groundwater monitoring wells in 1991 (MW-1, MW-2 and MW-3). Monitoring well MW-3 replaced the 1979 monitoring well, which was never monitored because the groundwater level is below the bottom of the well. Previous monitoring did not require depth to groundwater monitoring; however, the Discharger's reports indicate that MW-1 is the upgradient well. This Board Order will require depth to groundwater monitoring in order to establish the groundwater gradient.

[1] 5-day biochemical oxygen demand at 20 degrees Celsius.
[2] milligrams per Liter
[3] Total Suspended Solids
[4] Standard pH units
[5] Total Dissolved Solids

16. An irrigation well (14M1) was installed immediately northwest of the overflow ponds in 1986. The distance from well 14M1 to the nearest overflow pond is 180 feet.

17. BBARWA has reported that the depth to groundwater at the Lucerne Valley Facility is a minimum 150 feet below ground surface.

18. Groundwater monitoring data collected from monitoring wells MW-1, MW-2 and MW-3 during the period from 2009 to the present show the following average characteristics:

Constituent	Units	MW-1	MW-2	MW-3
Depth to Groundwater[6]	ft	176	130	141
TDS	mg/L	464	718	619
Total Nitrogen	mg/L	10.6	16.2	17.6
Nitrate as Nitrogen	mg/L	9.4	15.6	17.2
Sulfate	mg/L	63.3	203	173
Chloride	mg/L	106	122	135
Fluoride	mg/L	0.25	0.14	0.25
Boron	mg/L	<0.01	<0.01	<0.01
VOCs – MTBE	ug/L	9.0	ND	ND
VOCs – Methylene Chloride	ug/L	ND	1.4	1.1
VOCs – Bromomethane	ug/L	ND	ND	1.3

19. An analysis of groundwater monitoring data in monitoring wells MW1, MW2 and MW3 from 2000 to the present indicates that concentrations for nitrate, sulfate and chloride are decreasing in the downgradient wells (MW2 and MW3) and increasing in the upgradient well (MW1). This Board Order will require that the Discharger submit a technical report providing an analysis of the water quality impacts by nitrogen and TDS to groundwater resulting from the discharge and to report annual trend monitoring of the data collected in the groundwater monitoring network. The monitoring frequency for total nitrogen and nitrate in the groundwater monitoring wells will be increased from annually to monthly for 12 months and quarterly thereafter to establish groundwater gradient and flow direction. In addition, this Board Order will require annual reporting of nitrogen application of fertilizers and in farming practices and provide a nitrogen and water use balance for the recycled water used on-site.

20. Annual precipitation in the Lucerne Valley region averages about 5.5 inches. Annual evapotranspiration rate is approximately 68 inches.

21. The project lies beyond the toe of a large alluvial fan emanating from the mouth of Cushenbury Canyon in the eastern portion of Lucerne Valley.

[6] Measurement made in 2004.

22. There are several domestic wells in the vicinity of the on-site evaporation/percolation ponds.

23. Water supply to the Big Bear area communities is from numerous groundwater production wells located in Big Bear Valley. TDS in the water supply averages about 280 mg/L based on data reported in the BBARWA's SMRs from 2008 through 2015.

24. Regional groundwater flow in the irrigation and disposal area is generally to the northwest.

25. BBARWA conducted a geotechnical study referenced as *Geotechnical Study, Irrigation Site, Lucerne Valley Area, San Bernardino County, California for Big Bear Area Regional Wastewater Agency, July 29, 1977,* as an initial investigation of the site for use for irrigation. The report shows that the site is underlain by soils consisting of fine to coarse, clean to silty sands containing various amounts of grave from 5 to 24 feet below ground surface. Beneath this, to a depth of 60 to 100 feet below ground surface, the soil consists of fine to medium silty sands containing varying amounts of gravel, and is locally cemented with calcium carbonate accumulated during deposition of the sediments. Bedrock underlies the older alluvium at a depth of 400 to 600 feet.

Basin Plan, Beneficial Uses, and Regulatory Considerations

26. The Water Quality Control Plan for the Colorado River Basin Region of California (Basin Plan), which was adopted on November 17, 1993, and amended on November 13, 2012, designates the beneficial uses of ground and surface waters in this Region, and contains implementation programs and policies to achieve water quality objectives, including narrative objectives for ground water quality, in Chapter 3, section IV, Ground Water Objectives.

27. The discharge is within the Lucerne Hydrologic Unit. The beneficial uses of groundwater in the Lucerne Hydrologic Unit include:

    a. Municipal supply (MUN),

    b. Industrial supply (IND), and

    c. Agricultural supply (AGR).

28. These WDRs implement numeric and narrative water quality objectives for ground and surface waters established by the Basin Plan. The numeric objectives for groundwater designated for municipal and domestic supply are the maximum contaminant levels (MCLs) specified in sections 64431, 64444, and 64678 of Title 22 of the California Code of Regulations (CCR), and the bacteriological limits specified in section 64426.1 of Title 22, CCR.

29. It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This order promotes that policy by requiring discharges to meet maximum contaminant levels designed to protect human health and ensure that water is safe for domestic use.

30. Section 13267 of the CWC authorizes the Colorado River Basin Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and state

requirements.

31. This Order establishes WDRs pursuant to Division 7, Chapter 4, Article 4, of the CWC for discharges that are not subject to regulation under Clean Water Act (CWA) section 402 (33 U.S.C. section 1342).

32. Pursuant to CWC section 13263(g), the discharge of waste is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

33. The discharge authorized by this Board Order, and treatment and storage facilities associated with discharges of treated municipal wastewater, except for discharges of residual sludge and solid waste, are exempt from the requirements of the Consolidated Regulations for Treatment, Storage, Processing, or Disposal of Solid Waste, as set forth in Title 27, CCR, Division 2, Subdivision 1. This exemption is based on section 20090(a) of Title 27, which states in relevant part that discharges of domestic sewage or treated effluent are exempt provided that such discharges are regulated by WDRs, or for which WDRs have been waived, and which are consistent with applicable water quality objectives, and treatment or storage facilities.

Groundwater Degradation

34. State Water Board Resolution 68-16, "Policy with Respect to Maintaining High Quality Waters of the State"(Resolution 68-16) states:

    "Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies."

    Resolution 68-16 further states:

    "Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control [BPTC] of the discharge necessary to assure that (a) a pollution or nuisance will not occur and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained."

35. Some degradation of groundwater from the discharge to the evaporation/percolation ponds is consistent with Resolution 68-16, provided that the degradation:

    a. Is confined to a reasonable area;

    b. Is minimized by means of full implementation, regular maintenance, and optimal operation of BPTC measures;

    c. Is limited to waste constituents typically encountered in domestic wastewater; and

    d. Does not result in the loss of any beneficial use as prescribed in the applicable basin plan, or violation of any water quality objective.

36. The discharge of wastewater as permitted by Order R7-2016-0026 and Order R8-2005-

0044 reflects BPTC. The controls assure the discharge does not create a condition of pollution or nuisance, and that water quality will be maintained, which is consistent with the anti-degradation provisions of Resolution No. 68-16. The Discharger incorporates:

a. A WWTP that provides treatment to secondary standards and nitrification/denitrification processes;

b. An operation and maintenance manual;

c. Staffing to assure proper operation and maintenance;

d. A network of groundwater monitoring wells at the recycle site;

e. A requirement for an Irrigation Management Plan; and

f. A standby emergency power generator of sufficient size to operate the treatment plant and ancillary equipment during periods of loss of commercial power.

Accordingly, the discharge as authorized is consistent with the anti-degradation provisions of Resolution 68-16 and the applicable water quality objectives.

Constituents of Concern

37. Constituents in domestic wastewater effluent that present the greatest risk to groundwater quality are nitrogen, coliforms (pathogen-indicator organisms), and TDS. Recycled water used for irrigation at the Lucerne Valley Facility is treated to secondary standards and has undergone substantial removal of soluble organic matter, solids, and nitrogen treatment.

38. Title 22, CCR, section 64431, Maximum Contaminant Level (MCL) for Nitrate plus Nitrite as Nitrogen is 10 mg/L. To account for the fate of transport for the various components of Total Nitrogen, as a conservative value it is assumed that all nitrogen present converts to nitrate/nitrite. BBARWA's SMRs report an average of 6.9 mg/L for Total Nitrogen between April 2011 and March 2015. Prior to the operation of nitrification/denitrification processes at the WWTP, groundwater analyses at the irrigation and disposal site demonstrated degradation by nitrates. This Board Order will require the Discharger to provide a technical report in the form of a study that analyses the impacts to groundwater by the discharge and an evaluation of water quality trends. In addition, this Board Order will implement a monthly average effluent limitation of 10 mg/L for total nitrogen as a means to mitigate groundwater degradation.

39. While secondary treatment reduces fecal coliform densities by 90 to 99%, the remaining organisms in effluent are still 10^5 to 10^6 MPN/100 ml (United States Environmental Protection Agency, Design Manual, Municipal Wastewater Disinfection; October 1986). Given the depth to groundwater, it is not likely that pathogen-indicator bacteria will reach groundwater at densities exceeding those prescribed in Title 22, CCR.

40. The typical incremental addition of dissolved salts from domestic water usage is 150 to 380 mg/L. Domestic water supply to the Big Bear area communities showed an average concentration of about 280 mg/L during the period of 2011 to 2016. From April 2011 to March 2016 treated wastewater discharged had an average TDS concentration of approximately 450 mg/L. Thus, the average TDS increase over the domestic water supply in the discharge during the same time period was about 170 mg/L. Treated wastewater discharged by the WWTP has a TDS limit of a maximum of 400 mg/L above the domestic source water as regulated by Board Order 01-156. This Board Order will

require the Discharger to provide a technical report in the form of a study that analyzes the impacts to groundwater by the discharge and an evaluation of water quality trends. The results of the study will be used to establish an appropriate effluent limitation for TDS.

CEQA and Public Participation

41. In accordance with section 15301, Chapter 3, Title 14, CCR, the issuance of these WDRs, which govern the operation of an existing facility involving negligible or no expansion of use beyond that previously existing, is exempt from the provisions of the California Environmental Quality Act (CEQA, Pub. Resources Code, section 21000 et seq.).

42. The Colorado River Basin Water Board has notified the Discharger and all known interested agencies and persons of its intent to draft WDRs for this discharge, and has provided them with an opportunity for a public meeting and an opportunity to submit comments.

43. The Colorado River Basin Water Board, in a public meeting, heard and considered all comments pertaining to this discharge.

IT IS HEREBY ORDERED, that Board Order 01-156 is rescinded upon the effective date of this Order, except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code, and regulations adopted thereunder, the Discharger shall comply with the following:

A. Effluent Limitations

1. Effluent discharged into the overflow evaporation/percolation ponds for disposal shall not exceed the following effluent limits:

Constituent	Units	30-Day Arithmetic Mean	7-Day Arithmetic Mean	Daily Maximum
20^{o} C BOD_5	mg/L	30	45	-----
Total Suspended Solids	mg/L	30	45	-----
Chloride	mg/L	60	-----	80
Sulfate	mg/L	60	-----	80
Boron	mg/L	-----	-----	0.75
Total Nitrogen	mg/L	10	-----	-----

2. The 30-day average daily dry weather discharge for irrigation shall not exceed 4.8 MGD.

3. Effluent discharge for irrigation shall not have a pH below 6.0 or above 9.0.

B. Groundwater Limitations

1. Discharge at the Lucerne Valley Facility shall not cause groundwater to:

   a. Contain constituents in excess of California MCLs, as set forth in the California Code

of Regulations, Title 22, section 64426.1 for bacteriological constituents; section 64431 for inorganic chemicals; section 64444 for organic chemicals; and section 64678 for determination of exceedances of lead and copper action levels.

b. Contain taste or odor-producing substances in concentrations that adversely affect beneficial uses as a result of human activity.

C. Discharge Prohibitions

1. Discharge of waste classified as "hazardous", as defined in Title 23, CCR, section 2521(a), or "designated", as defined in California Water Code section 13173, is prohibited.

2. Discharge of treated wastewater at a location other than the designated disposal areas or as recycled water used for irrigation at approved use areas, is prohibited.

3. The discharge of recycled water to any drainage courses or surface waters is prohibited.

4. Discharge of waste to land not owned or authorized for such use by the Discharger is prohibited.

5. Surfacing or ponding of wastewater outside of the designated disposal locations is prohibited.

6. Bypass, overflow, discharge, or spill of untreated or partially treated waste is prohibited.

7. Application recycled water and fertilizers containing nitrogen at a rate greater than the agronomic uptake rate of the crops grown is prohibited.

D. Discharge Specifications

1. The discharge shall not cause pollution or nuisance as defined in sections 13050(l) and 13050(m) of Division 7 of the California Water Code, respectively.

2. A minimum depth of freeboard of two (2) feet shall be maintained at all times in the overflow earthen basins and concrete-lined reservoir.

3. The overflow ponds shall be managed to prevent breeding of mosquitoes. In particular:
    a. An erosion control program should assure that small coves and irregularities are not created around the perimeter of the water surface.
    b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.
    c. Dead algae, vegetation, and debris shall not accumulate on the water

4. All storage and disposal areas shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

5. The overflow ponds shall have sufficient capacity to accommodate allowable wastewater flow, design seasonal precipitation, ancillary inflow, and infiltration during the non-irrigation season. Design seasonal precipitation shall be based on total

annual precipitation using a return period of 100 years, distributed monthly in accordance with historical rainfall patterns.

6. Public contact with non-disinfected wastewater shall be precluded through such means as fences, signs, and other acceptable alternatives. The non-disinfected wastewater is not approved for off-site distribution. Conspicuous signs shall be posted in a prominent location in each area where non-disinfected wastewater is stored on-site. Each sign or label with "Non-disinfected wastewater - No body contact or drinking" wording shall be displayed as well as the international warning symbol.

7. Objectionable odors originating at the Lucerne Valley Facility shall not be perceivable beyond the limits of the wastewater treatment and disposal area.

8. The overflow ponds and concrete-lined reservoir shall be maintained so they will be kept in aerobic conditions.

9. The dissolved oxygen content in the upper zone (one foot) of the concrete reservoir and overflow ponds shall not be less than 1.0 mg/L.

10. There shall be no surface flow of wastewater away from the designated disposal areas.

11. On-site wastes, including windblown spray from recycled water application, shall be strictly confined to the lands specifically designated for the disposal operation, and on-site irrigation practices shall be managed so there is no runoff of effluent from irrigated areas.

12. No irrigation with, or impoundment of, undisinfected secondary recycled water shall take place within 150 feet of any domestic water supply well.

13. No spray irrigation of any recycled water shall take place within 100 feet of a residence or a place where public exposure could be similar to that of a park, playground or schoolyard.

14. Except as allowed under Section 7604 of Title 17, California Code of Regulations, no physical connection shall be made or allowed to exist between any recycled water system and any separate system conveying potable water.

15. Undisinfected secondary recycled water, as defined in Title 22, Section 60301.900 is limited only for irrigation in the following applications:

    a. Orchards where the recycled water does not come into contact with the edible portion of the crop,

    b. Vineyards where the recycled water does not come into contact with the edible portion of the crop,

    c. Non-food bearing trees (Christmas tree farms are included in this category provided no irrigation with recycled water occurs for a period of 14 days prior to harvesting or allowing access by the general public),

    d. Fodder and fiber crops and pasture for animal not producing milk for human consumption,

e. Seed crops not eaten by humans,

f. Food crops that must undergo commercial pathogen-destroying processing before being consumed by humans, and

g. Ornamental nursery stock and sod farms provided no irrigation with recycled water occurs for a period of 14 days prior to harvesting, retail sale, or allowing access by the general public.

16. No recycled water used for irrigation, or soil that has been irrigated with recycled water, shall come into contact with edible portions of food crops eaten raw by humans.

17. The storage, delivery, or use of recycled water shall not individually or collectively, directly or indirectly, result in pollution, or adversely affect water quality, as defined in the CWC.

18. The delivery or use of recycled water shall be in conformance with the reclamation criteria contained in Title 22, or amendments thereto, for the irrigation of food crops, irrigation of fodder, fiber, and seed crops, landscape irrigation, supply of recreational impoundments and ground water recharge.

19. Prior to delivering recycled water to any new user, BBARWA shall submit to the Colorado River Basin Water Board a report discussing any new distribution system being constructed by the Discharger to provide service to the new user.

20. Recycled water shall not be delivered to any new user who has not first received a discharge permit from the Colorado River Basin Water Board and approval from the SWRCB's Division of Drinking Water.

21. Treated or untreated sludge or similar solid waste materials shall be disposed at locations approved by the Colorado River Basin Water Board's Executive Officer.

22. Grazing of sheep on the irrigation site is allowed only under the following conditions, unless otherwise approved by the Colorado River Basin Water Board 's Executive Officer:

    a. Grazing will only be conducted in October or November after the last cutting of hay has been baled;

    b. Grazing animals will not be allowed into a portion of the site until 10 days after it was last irrigated;

    c. Temporary fences will be erected to contain the grazing animals in an area of 40 acres or less;

    d. Only ewes that are about to lamb or ewes with newly born will be grazed;

    e. No animals will be sold for slaughter within 90 days after grazing.

    f. No milk produced by sheep that have grazed at the irrigation site shall be used for human consumption.

E. Special Provisions

1. Within **three months** of the adoption of this Board Order, the Discharger shall submit a technical report that is a work plan, for approval by the Colorado River Basin Water

Board's Executive Officer, to conduct a study of the groundwater in the vicinity of the recycled water irrigation use site. The objective of the study shall be to address the impacts that the discharges to unlined ponds and the irrigation area have on areal groundwater quality. The Discharger shall submit the final technical report containing the results of the study within **18 months** of the adoption of this Board Order and shall propose recommendations to mitigate the effects of nitrogen loading to groundwater and propose an appropriate effluent limit for TDS.

2. Within six months of the adoption of this Board Order, the Discharger shall prepare and submit an Irrigation Management Plan that includes a water balance and nutrient balance to assure that recycled water is applied at appropriate rates. The Irrigation Management Plan shall be submitted for approval by the Colorado River Basin Water Board's Executive Officer.

3. Within **nine months** of the adoption of this Order, the Discharger shall submit to the Colorado River Basin Water Board office a technical report that includes a copy of the Maintenance and Operations Manual for the Lucerne Valley Facility.

F. Standard Provisions

1. The Discharger shall comply with all of the conditions of this Board Order. Noncompliance is a violation of the Porter-Cologne Water Quality Control Act (CWC, section 13000 et seq.), and is grounds for enforcement action.

2. The Discharger shall comply with Monitoring and Reporting Program R7-2016-0026 and future revisions thereto as specified by the Colorado River Basin Water Board's Executive Officer.

3. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0026, and future revisions thereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker https://geotracker.waterboards.ca.gov/ database. Documents that are normally mailed by the Discharger, such as regulatory documents, narrative technical monitoring program reports, and such reports submissions, materials, data, and correspondence, to the Colorado River Basin Water Board shall also be uploaded into GeoTracker in the appropriate Microsoft software application, such as word, excel, or an Adobe Portable Document Format (PDF) file. Large documents are to be split into manageable file sizes appropriately labelled and uploaded into GeoTracker.

4. All technical reports required in conjunction with this Order are required pursuant to Section 13267 of the CWC, and shall include a statement by the Discharger, or an authorized representative of the Discharger, certifying under penalty of perjury under the laws of the State of California, that the report is true, complete, and accurate.

5. In accordance with California Business and Professions Code Sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of California registered professionals (i.e., civil engineer, engineering geologist, geologist, etc.) competent and proficient in the fields pertinent to the required activities. All technical reports specified herein that contain work plans, that describe the conduct of investigations and studies, or that contain technical conclusions and

recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately qualified professionals, even if not explicitly stated. Each technical report submitted by the Discharger shall contain a statement of qualifications of the responsible licensed professionals as well as the professional's signature and/or stamp of the seal. Additionally, to the extent that preparation of a required technical report involves field activities, field activities shall be conducted under the direct supervision of one or more of these professionals.

6. The Discharger shall not cause degradation of any water supply in accordance with State Water Board Resolution 68-16.

7. Standby power generating facilities shall be available to operate the plant during a commercial power failure.

8. Adequate measures shall be taken to assure that flood or surface drainage waters do not erode or otherwise render portions of the discharge facilities inoperable.

9. The use of recycled water at the Lucerne Valley Facility shall be supervised by persons possessing certification of appropriate grade pursuant to section 3680, Chapter 26, Division 3, Title 23 of the California Code of Regulations.

10. The Discharger shall at all times properly operate and maintain all systems and components of collection, treatment and control, installed or used by the Discharger to achieve compliance with this Board Order. Proper operation and maintenance includes effective performance, adequate process controls, and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities/systems when necessary to achieve compliance with this Board Order. All systems in service or reserved shall be inspected and maintained on a regular basis. Records of inspections and maintenance shall be retained, and made available to the Colorado River Basin Water Board's Executive Officer on request.

11. The Discharger shall ensure that all site-operating personnel are familiar with the content of this Board Order, and shall maintain a copy of this Board Order at the site.

12. The Discharger shall allow the Colorado River Basin Water Board, or an authorized representative, upon presentation of credentials and other documents as may be required by law, to:

    a. Enter the premises regulated by this Board Order, or the place where records are kept under the conditions of this Board Order;

    b. Have access to and copy, at reasonable times, records kept under the conditions of this Board Order;

    c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Board Order; and

    d. Sample or monitor at reasonable times, for the purpose of assuring compliance with this Board Order or as otherwise authorized by the California Water Code, any substances or parameters at this location.

13. Ponds shall be managed to prevent breeding of mosquitoes. In particular,

    a. An erosion control program should assure that small coves and irregularities are not

created around the perimeter of the water surface.

b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.

c. Dead algae, vegetation, and debris shall not accumulate on the water surface.

14. Disposal of oil and grease, biosolids, screenings, and other solids collected from liquid wastes shall be pursuant to Title 27, and the review and approval of the Colorado River Basin Water Board Executive Officer.

15. Any proposed change in use or disposal of biosolids requires the approval of the Colorado River Basin Water Board Executive Officer, and U.S. Environmental Protection Agency Regional Administrator, who must be notified at least 90 days in advance of the change.

16. Sludge use and disposal shall comply with Federal and State laws and regulations, including permitting requirements, and technical standards in 40 CFR Part 503. If the State and Colorado River Basin Water Boards are delegated the authority to implement 40 CFR Part 503 regulations, this Order may be revised to incorporate appropriate time schedules and technical standards. The Discharger shall comply with the standards and time schedules in 40 CFR part 503, whether or not part of this Order.

17. The Discharger shall provide a plan as to the method, treatment, handling and disposal of sludge that is consistent with all State and Federal laws and regulations and obtain prior written approval from the Colorado River Basin Water Board specifying location and method of disposal, before disposing of treated or untreated sludge, or similar solid waste.

18. The Discharger shall maintain a permanent log of all solids hauled away from the treatment facility for use/disposal elsewhere and shall provide a summary of the volume, type (screenings, grit, raw sludge, digested sludge), use (agricultural, composting, etc.), and the destination in accordance with the MRP of this Board Order. Sludge that is stockpiled at the treatment facility shall be sampled and analyzed for those constituents listed in the sludge monitoring section of the MRP of this Board Order and as required by Title 40, Code of Federal Regulations, Part 503. The results of the analyses shall be submitted to the Colorado River Basin Water Board as part of the MRP.

19. The Discharger shall provide a report to the Colorado River Basin Water Board when it determines that the plant's average dry-weather flow rate for any month exceeds 80 percent of the design capacity. The report should indicate what steps, if any, the Discharger intends to take to provide for the expected wastewater treatment capacity necessary when the plant reaches design capacity.

20. Prior to implementing a modification that results in a material change in the quality or quantity of wastewater treated or discharged, or a material change in the location of discharge, the Discharger shall report all pertinent information in writing to the Colorado River Basin Water Board, and obtain revised requirements.

21. Prior to a change in ownership or management of the Lucerne Valley Facility, the Discharger shall transmit a copy of this Board Order to the succeeding owner/operator, and forward a copy of the transmittal letter to the Colorado River Basin Water Board.

22. The Discharger shall provide adequate notice to the Colorado River Basin Water Board

Executive Officer of the following:

a. Any substantial change in the volume or character of pollutants introduced into any treatment facility described in the Findings of this Board Order, by an existing or new source; and

b. Any planned physical alteration or addition to the facilities described in this Board Order, or change planned in the Discharger's sludge use or disposal practice, where such alterations, additions, or changes may justify the application of Board Order conditions that are different from or absent in the existing Board Order, including notification of additional disposal sites not reported during the Board Order application process, or not reported pursuant to an approved land application plan.

23. The Discharger shall report orally, any noncompliance that may endanger human health or the environment. The noncompliance shall be reported immediately to the Colorado River Basin Water Board's Executive Officer at (760) 346-7491, and the California Office of Emergency Services at (800) 852-7550 as soon as:

    a. The Discharger has knowledge of the discharge,

    b. Notification is possible, and

    c. Notification will not substantially impede cleanup or other emergency measures.

    During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board's office voice recorder at the above listed number. Incident information shall be provided orally as soon as possible and within 24 hours from the time the Discharger becomes aware of the incident. A written report shall also be provided within five (5) business days of the time the Discharger becomes aware of the incident. The written report shall contain a description of the noncompliance and its cause, the period of noncompliance, the anticipated time to achieve full compliance, and the steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance. The Discharger shall report all intentional or unintentional spills in excess of one thousand (1,000) gallons occurring within the Colorado River Basin Water Board's jurisdiction, including the Lucerne Valley Facility or disposal line, in accordance with the above time limits.

24. The Discharger shall report all instances of noncompliance. Reports of noncompliance shall be submitted with the Discharger's next scheduled SMRs or earlier if requested by the Colorado River Basin Water Board's Executive Officer, or if required by an applicable standard for sludge use and disposal.

25. By-pass (i.e., the intentional diversion of waste streams from any portion of the treatment facilities, except diversions designed to meet variable effluent limits) is prohibited. The Colorado River Basin Water Board may take enforcement action against the Discharger for by-pass unless:

    a. By-pass was unavoidable to prevent loss of life, personal injury, or severe property damage. Severe property damage means substantial physical damage to property, damage to the treatment facilities that causes them to be inoperable, or substantial and permanent loss of natural resources reasonably expected to occur in the absence of a by-pass. Severe property damage does not mean economic loss caused by delays in production; and

    There were no feasible alternatives to by-pass, such as the use of auxiliary treatment

facilities or retention of untreated waste. This condition is not satisfied if adequate back-up equipment was not installed to prevent by-pass occurring during equipment downtime, or preventive maintenance.

b. By-pass is:

   i. Required for essential maintenance to assure efficient operation; and

   ii. Neither effluent nor receiving water limitations are exceeded; and

   iii. The Discharger notifies the Colorado River Basin Water Board ten (10) days in advance.

26. In the event of an unanticipated by-pass, the Discharger shall immediately report the incident to the Colorado River Basin Water Board. During non-business hours, the Discharger shall leave a message on the Colorado River Basin Water Board office voice recorder. A written report shall be provided within five business days the Discharger is aware of the incident. The written report shall include a description of the by-pass, any noncompliance, the cause, period of noncompliance, anticipated time to achieve full compliance, and steps taken or planned, to reduce, eliminate, and prevent recurrence of the noncompliance.

27. Federal regulations for storm water discharges require specific categories of facilities which discharge storm water associated with industrial activity (storm water) to obtain National Pollutant Discharge Elimination System (NPDES) permits and to implement Best Conventional Pollutant Technology (BCT) and Best Available Technology Economically Achievable (BAT) to reduce or eliminate industrial storm water pollution.

28. All storm water discharges from this facility must comply with the lawful requirements of municipalities, counties, drainage districts, and other local agencies, regarding discharges of storm water to storm water drain systems or other courses under their jurisdiction.

29. Storm water discharges from the facility shall not cause or threaten to cause pollution or contamination.

30. Storm water discharges from the facility shall not contain hazardous substances equal to or in excess of a reportable quantity listed in 40 CFR Part 117 and/or 40 CFR Part 302.

31. The Discharger is the responsible party for the waste discharge requirements and the monitoring and reporting program for the facility. The Discharger shall comply with all conditions of these waste discharge requirements. Violations may result in enforcement actions, including Colorado River Basin Water Board Orders or court orders, requiring corrective action or imposing civil monetary liability, or in modification or revocation of these waste discharge requirements by the Colorado River Basin Water Board.

32. This Board Order does not authorize violation of any federal, state, or local laws or regulations.

33. This Board Order does not convey property rights of any sort, or exclusive privileges, nor does it authorize injury to private property or invasion of personal rights, or infringement of federal, state, or local laws or regulations.

34. This Board Order may be modified, rescinded, or reissued, for cause. The filing of a

request by the Discharger for a Board Order modification, rescission or reissuance, or notification of planned changes or anticipated noncompliance, does not stay any Board Order condition. Causes for modification include a change in land application plans, or sludge use or disposal practices, and adoption of new regulations by the State or Colorado River Basin Water Board (including revisions to the Basin Plan), or Federal government.

I, Jose L. Angel, Executive Officer, do hereby certify the foregoing is a full, true and correct copy of an Order adopted by the California Regional Water Quality Control Board, Colorado River Basin Region, on June 30, 2016.

Jose L. Angel

JOSE L. ANGEL P.E.
Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

MONITORING AND REPORTING PROGRAM R7-2016-0026
FOR
BIG BEAR AREA REGIONAL WASTEWATER AGENCY, OWNER/OPERATOR
EXPORT OF RECYCLED WATER TO LUCERNE VALLEY
Lucerne Valley – San Bernardino County

Location of Discharge:
Section 14, T4N, R1E, SBB&M

A. Monitoring

1. This Monitoring and Reporting Program (MRP) describes requirements for monitoring a wastewater system and groundwater quality (when needed). This MRP is issued pursuant to California Water Code (CWC) section 13267. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Executive Officer.

2. Water Code section 13267 states, in part:

   "In conducting an investigation specified in subdivision (a), the Colorado River Basin Water Board may require that any person who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge waste within its region, or any citizen or domiciliary, or political agency or entity of this state who has discharged, discharges, or is suspected of having discharged or discharging, or who proposes to discharge, waste outside of its region that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the Colorado River Basin Water Board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports. In requiring those reports, the Colorado River Basin Water Board shall provide the person with a written explanation with regard to the need for the reports, and shall identify the evidence that supports requiring that person to provide the reports."

3. Water Code section 13268 states, in part:

   "(a) (1) Any person failing or refusing to furnish technical or monitoring program reports as required by subdivision (b) of section 13267, or failing or refusing to furnish a statement of compliance as required by subdivision (b) of section 13399.2, or falsifying any information provided therein, is guilty of a misdemeanor, and may be liable civilly in accordance with subdivision (b). (b) (1) Civil liability may be administratively imposed by a Colorado River Basin Water Board in accordance with Article 2.5 (commencing with section 13323) of Chapter 5 for a violation of subdivision (a) in an amount which shall not exceed one thousand dollars ($1,000) for each day in which the violation occurs."

4. BBARWA owns and operates the wastewater system that is subject to Board Order R7-2016-0026. The reports are necessary to ensure that the Discharger complies with the Order. Pursuant to Water Code section 13267, the Discharger shall implement the MRP and shall submit the monitoring reports described herein.

5. All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The time, date, and location of each grab sample shall be recorded

on the sample chain of custody form. If composite samples are collected, the basis for sampling (time or flow weighted) shall be approved by Colorado River Basin Water Board staff.

6. Field test instruments (such as those used to test pH, dissolved oxygen, and electrical conductivity) may be used provided that:
   a. The user is trained in proper use and maintenance of the instruments;
   b. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;
   c. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and
   d. Field calibration reports are submitted as described in the "Reporting" section of this MRP.

7. The collection, preservation and holding times of all samples shall be in accordance with U. S. Environmental Protection Agency (USEPA) approved procedures. Unless otherwise approved by the Colorado River Basin Water Board's Executive Officer, all analyses shall be conducted by a laboratory certified by the State Water Resources Control Board, Division of Drinking Water. All analyses shall be conducted in accordance with the latest edition of the "Guidelines Establishing Test Procedures for Analysis of Pollutants" (40 CFR Part 136), promulgated by the USEPA.

8. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for period greater than 24-hours, the Discharger shall obtain representative grab samples each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. The Discharger shall report the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.

9. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Board Order, and records of all data used to complete the application for this Board Order, for a period of at least five (5) years from the date of the sample, measurement, report or application. This period may be extended by request of the Colorado River Basin Water Board's Executive Officer at any time. Records of monitoring information shall include:
   a. The date, exact place, and time of sampling or measurement(s);
   b. The individual(s) who performed the sampling or measurement(s);
   c. The date(s) analyses were performed;
   d. The individual(s) who performed the analyses;
   e. The analytical techniques or method used; and
   f. The results of such analyses.

10. Samples shall be collected at the location specified in the WDRs. If no location is

specified, sampling shall be conducted at the most representative sampling point available.

11. Given the monitoring frequency prescribed by MRP R7-2016-0026, if only one sample is available for a given reporting period, compliance with monthly average, or weekly average Discharge Specifications, will be determined from that sample.

12. If the facility is not in operation, or there is no discharge during a required reporting period, the Discharger shall forward a letter to the Colorado River Basin Water Board indicating that there has been no activity during the required reporting period.

Effluent Monitoring

13. Representative samples of the undisinfected secondary recycled water shall be taken at the WWTP. The samples shall be analyzed for the following constituents:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Irrigation Flow	MGD	Flow Meter Reading	Daily	Monthly
20°C BOD_5	mg/L	24 Hr. Composite	2x/Month	Monthly
Total Suspended Solids	mg/L	24 Hr. Composite	2x/Month	Monthly
pH	s.u. [1]	Grab	Daily	Monthly
Dissolved Oxygen[2]	mg/L	Grab	Monthly	Monthly
Total Dissolved Solids	mg/L	24 Hr. Composite	Monthly	Monthly
Sulfate (SO_4)	mg/L	24 Hr. Composite	Monthly	Monthly
Chloride	mg/L	24 Hr. Composite	2x/Month	Monthly
Fluoride (F)	mg/L	24 Hr. Composite	Monthly	Monthly
Nitrate (NO_3-N) as N	mg/L	24 Hr. Composite	Monthly	Monthly
Total Nitrogen	mg/L	24 Hr. Composite	Monthly	Monthly
VOCs[3]	µg/L[4]	24 Hr. Composite	Annually	Annually

Overflow Pond Monitoring

14. During months when the overflow evaporation/percolation ponds are not used, the Discharger shall report that there has been no activity. During months when the overflow evaporation percolation ponds are in use, the ponds shall be monitored according to the following schedule:

[1] standard pH units
[2] Dissolved Oxygen shall be monitored at the upper one foot layer of the storage or percolation ponds.
[3] Analysis of Volatile Organic Compounds is to be accomplished using the USEPA test methods 601, 602 or 624
[4] micrograms per liter

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Flow Quantity	MGD	Flow Measurement	Daily	Monthly
Dissolved Oxygen	mg/L	Grab	Twice Monthly	Monthly
pH	s.u.	Grab	Twice Monthly	Monthly
Total Dissolved Solids	mg/L	Grab	Twice Monthly	Monthly
Freeboard	ft	Measurement	Twice Monthly	Monthly

Groundwater Monitoring

15. The groundwater monitoring wells shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring[5] Frequency	Reporting Frequency
Depth to Groundwater	ft (msl)[6]	Measurement	Monthly	Monthly
Groundwater Gradient[7]	NA	Direction	Monthly	Monthly
Total Nitrogen	mg/L	Grab	Monthly	Monthly
Nitrate as N	mg/L	Grab	Monthly	Monthly
Chloride	mg/L	Grab	Monthly	Monthly
Fluoride	mg/L	Grab	Monthly	Monthly
Sulfate	mg/L	Grab	Monthly	Monthly
Total Dissolved Solids	mg/L	Grab	Monthly	Monthly
Boron	mg/L	Grab	Monthly	Monthly
VOCs	μg/L	Grab	Annually	Annually

Domestic Water Supply Monitoring

16. The domestic water supply shall be a flow weighted composite sample monitored at the water supply production wells in Big Bear Valley and include notations of which wells are non-operating for a reporting period and in accordance to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Dissolved Solids	mg/L	Grab	Annually	Annually

[5] Groundwater monitoring shall be performed monthly for the first 12 months and quarterly thereafter.
[6] Above mean sea level.
[7] Groundwater flow direction.

B. Reporting

1. The Discharger shall inspect and document any operation/maintenance problems by inspecting each unit process. Operation and Maintenance reports shall be submitted to the Colorado River Basin Water Board Office annually, containing documentation showing the calibration of flow meters and equipment as performed in a timely manner, modifications and updates to the Operation and Maintenance Manual, and modifications and updates to the Agency's waste water ordinance or rules and regulations.

2. The Discharger shall annually report a trend monitoring analysis for total nitrogen and nitrates in the groundwater in the vicinity of the recycled water use site. The analysis shall be reported with the Discharger's annual Self-Monitoring Report (SMR).

3. The Discharger shall provide an annual nitrogen balance for the recycled water use site which includes nitrogen loading by application of recycled water and the use of fertilizers for farming. Nitrogen balance shall consider nitrogen uptake by crops grown and provide documentation of crop-specific nitrogen uptake rates. The analysis shall be reported with the Discharger's annual SMR.

4. The Discharger shall provide an operator certification status update including number of staff and grade certification annually.

5. SMRs shall be certified under penalty of perjury to be true and correct, and shall contain the required information at the frequency designated in this MRP.

6. Each Report must contain an affirmation in writing that:

   "All analyses were conducted at a laboratory certified for such analyses by and in accordance with current USEPA procedures or as specified in this Monitoring and Reporting Program."

7. Each Report shall contain the following completed declaration:

   "I certify under the penalty of law that this document, including all attachments and supplemental information, was prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of a fine and imprisonment.

   Executed on the _____day of _____ at _____

   _____(Signature)

   _____(Title)"

8. The SMRs, and other information requested by the Colorado River Basin Water Board, shall be signed by a principal executive officer or ranking elected official.

9. A duly authorized representative of the Discharger may sign the documents if:

   a. The authorization is made in writing by the person described above;

b. The authorization specified an individual or person having responsibility for the overall operation of the regulated disposal system; and

c. The written authorization is submitted to the Colorado River Basin Water Board's Executive Officer.

10. The Discharger shall attach a cover letter to the SMRs. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned and the proposed time schedule of corrective actions. Identified violations should include a description of the requirement that was violated and a description of the violation.

11. Daily, weekly, and monthly monitoring shall be included in the monthly monitoring report. Monthly monitoring reports shall be submitted to the Colorado River Basin Water Board by the 15th day of the following month. Quarterly monitoring reports shall be submitted by January 15th, April 15th, July 15th and October 15th. Annual monitoring reports shall be submitted by January 31st of the following year.

12. The Discharger shall comply with the Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under Monitoring and Reporting Program (MRP) R7-2016-0026, and future revisions thereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and pdf monitoring reports to the State Water Resources Control Board GeoTracker database. Documents that are 2.0 MB or larger should be broken down into smaller electronic files, labelled properly and uploaded into GeoTracker.

ORDER NO. R8-2005-0044

WASTE DISCHARGE AND PRODUCER/USER WATER RECYCLING REQUIREMENTS

The following Discharger is authorized to discharge in accordance with the Waste Discharge Requirements set forth in this Order:

Discharger	**Big Bear Area Regional Wastewater Agency**
Name of Facility	**Regional Treatment Plant, Big Bear City**
Facility Address	**122 Palomino Drive**
	Big Bear City, CA 92314
	San Bernardino

The Discharger is authorized to discharge from the following discharge points as set forth below:

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water	Disposal Site	Recycling Reuse
001	Secondary effluent without disinfection	34 ° 26' 20" N	116 ° 51' 20" W	Lucerne Hydrologic Unit	Storage Ponds in Lucerne Valley	Irrigation in Lucerne Valley[1]
002	Secondary effluent with disinfection	34 ° 16' 10" N	116 ° 49' 00" W	State surface water: Storage pond in Baldwin Lake; Big Bear Valley groundwater management zone	--	construction and wildlife habitat
003	Tertiary effluent with disinfection	34 ° 16' 10" N	116 ° 49' 00" W	Big Bear Valley groundwater management zone	--	Irrigation

This Order was adopted by the Regional Water Board on:	**June 24, 2005**
This Order shall become effective on:	**June 24, 2005**

[1] The Colorado River Basin Regional Water Quality Control Board (Region 7) has issued waste discharge requirements for the use of the recycled wastewater in the Lucerne Valley.

IT IS HEREBY ORDERED, that Order No. 00-12 is superseded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code (CWC) and regulations adopted thereunder, the Discharger shall comply with the requirements in this Order.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that Order No. R8- 2005-0044 with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on June 24, 2005.

Gerard J. Thibeault, Executive Officer

I. FACILITY INFORMATION

The following Discharger is authorized to discharge in accordance with the Waste Discharge Requirements set forth in this Order:

Discharger	**Big Bear Area Regional Wastewater Agency**
Name of Facility	**Regional Treatment Plant, Big Bear City**
Facility Address	**122 Palomino Drive**
	Big Bear City, CA 92314
	San Bernardino
Facility Contact, Title, and Phone	**Joseph Hanford, Interim Plant Superintendent (909) 584-4018**
Mailing Address	**P. O. BOX 517, 122 Palomino Drive, Big Bear City, CA 92314**
Type of Facility	**POTW**
Facility Design Flow	**4.89 million gallons per day (mgd)**

II. FINDINGS

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Water Board), finds:

A. **Background.** Big Bear Area Regional Wastewater Agency (hereinafter Discharger) is currently discharging pursuant to Order No. 00-12 and National Pollutant Discharge Elimination System (NPDES) Permit No. CA8000344. The Discharger submitted a Report of Waste Discharge, dated August 26, 2004, and applied for renewal of waste discharge requirements to discharge up to 4.89 mgd of secondary treated and/or up to 1.0 mgd of tertiary treated wastewater from the Regional Treatment Plant, hereinafter Facility. The application was deemed complete on February 14, 2005.

The discharger has eliminated two previous discharge locations into the waters of the U.S. These two discharge locations were Discharge Serial No. 002 (East end of Stanfield Marsh) and 003 (Baldwin Lake Stickleback habitat). The discharger plans to deliver recycled water to a pond in Baldwin Lake to create a wildlife habitat area. Based on the U.S. Army Corps of Engineers' determination, the pond within the Baldwin Lake area is not considered waters of the U.S. Therefore, this Order is issued as Waste Discharge and Producer/User Water Recycling Requirements; an NPDES permit is no longer necessary.

B. **Facility Description.** The Discharger owns and operates a POTW. The treatment system consists of: preliminary treatment, secondary treatment, tertiary treatment, disinfection system, and sludge treatment system. Most of the treated wastewater is discharged through Discharge Point 001 (see table on cover page) into storage ponds in the Lucerne Valley for use in irrigation of fodder, fiber and seed crops. A minimal volume of treated wastewater is discharged through Discharge Points 002 and 003 for recycling and reuse at various sites for irrigation, dust control at construction sites, and wildlife habitat restoration in the Baldwin Lake. Attachment B provides a map of the area around the facility. Attachment C provides a flow schematic of the facility.

Stormwater runoff from the three discharge points of the RTP discharges into a flood zone, which is located at the east side of the plant. In heavy storm seasons, there is the possibility of overflow from the flooding zone into offsite surface waters.

C. **Legal Authorities.** This Order is issued pursuant to Chapter 5.5, Division 7 of the California Water Code (CWC). This Order serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC.

This Order also includes requirements based on Title 22, Division 4, Chapter 3, of California Code of Regulations, which specifies regulations for the use of recycled water for irrigation and construction purposes.

D. **Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on information submitted as part of the application and through monitoring and reporting programs. Attachments A through F, which contain background information and rationale for Order requirements, are hereby incorporated into this Order and, thus, constitute part of the Findings for this Order.

E. **California Environmental Quality Act (CEQA).** The project involves the update of waste discharge requirements for an existing facility and, as such, is exempt from the California Environmental Quality Act (Public Resources Code, Section 21100 et. seq.) in accordance with Section 15301, Chapter 3, Title 14, California Code of Regulations.

F. **Water Quality Control Plans.** The Regional Water Board adopted a revised Water Quality Control Plan for the Santa Ana Region (hereinafter Basin Plan) that became effective on January 24, 1995. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the Santa Ana Region addressed through the plan. More recently, the Basin Plan was amended significantly to incorporate revised boundaries for groundwater subbasins, now termed "management zones", new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. This Basin Plan Amendment was adopted by the Regional Board on January 22, 2004. The State Water Resources Control Board and Office of Administrative Law (OAL) approved the Amendment on September 30, 2004 and December 23, 2004, respectively.

These Basin Plan changes did not affect groundwater in the Big Bear area, apart from the re-designation of the Big Bear Valley groundwater subbasin as a groundwater management zone. Beneficial uses applicable to the Big Bear Valley Groundwater Management Zone and Lucerne Hydrologic Unit are as follows:

Discharge Point	Receiving Water Name	Beneficial Use(s)
001	Lucerne Hydrologic Unit	Based on Region 7's Basin Plan. 1. Municipal supply 2. Industrial supply 3. Agricultural supply
002	A pond in Baldwin Lake; and Big Bear Valley groundwater management zone	Beneficial Uses for Baldwin Lake: Intermittent: 1. Water contact recreation (REC-1), 2. Non-contact water recreation (REC-2), 3. Warm freshwater habitat (WARM), 4. Cold freshwater habitat (COLD), 5. Preservation of biological habitats of special significance (BIOL), 6. Wildlife habitat (WILD), and 7. Rare, threatened or endangered species (RARE). Beneficial Uses for groundwater management zone: Present or Potential: Municipal and domestic supply, industrial service supply.
003	Big Bear Valley groundwater management zone	Beneficial Uses for ground water management zone: Present or potential: Municipal and domestic supply, industrial service supply.

Requirements of this Order specifically implement the applicable Water Quality Control Plans.

G. **Industrial Stormwater Requirements.** Pursuant to Section 402(p) of the Clean Water Act and Title 40 of the Code of Federal Regulations (CFR) Part 122, 123, and 124, the State Water Resources Control Board adopted general NPDES permits to regulate storm water discharges associated with industrial activities (State Board Order No. 97-03-DWQ) adopted on April 17, 1997. The discharger's stormwater program was regulated previously under Order No. 00-12. For this Order, storm water discharge from the RTP is subject to requirements under the general permit. The discharger shall submit notice of intent to be covered under this general permit and develop and implement Storm Water Pollution Prevention Plans to comply with the general NPDES permit.

H. **Antidegradation Policy.** The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. As discussed in the Fact Sheet (Attachment E), the permitted discharge is consistent with the antidegradation provisions of State Water Board Resolution No. 68-16.

I. **Monitoring and Reporting.** Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement State requirements. This Monitoring and Reporting Program is provided in Attachment D.

J. **Biosolids Requirements.** On February 19, 1993, the USEPA issued a final rule for the use and disposal of sewage sludge, 40 CFR, Part 503. This rule requires that producers of sewage sludge meet certain reporting, handling, and disposal requirements. The State of California has not been delegated the authority to implement this program, therefore, the U.S. Environmental Protection Agency is the implementing agency. However, this Order includes Regional Board biosolids requirements.

K. **Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet (Attachment E) of this Order.

L. **Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet (Attachment E) of this Order.

III. DISCHARGE PROHIBITIONS

A. Wastes discharged from each of the following Discharge Points shall be limited to the type of effluent shown in the following table:

Discharge Point	Type of Effluent
001	Secondary effluent without disinfection[a]
002	Secondary effluent with disinfection[b]
003	Tertiary effluent with disinfection

a. Secondary or tertiary effluent with disinfection may also be discharged at this location.
b. Tertiary effluent with disinfection may also be discharged at this location.

B. Discharge of wastewater at a location or in a manner different from that described in A. above is prohibited.
C. The bypass or overflow of untreated wastewater or wastes to surface waters or surface water drainage courses is prohibited
D. The discharge of any substances in concentrations toxic to animal or plant life in the affected receiving water is prohibited.
E. There shall be no visible oil and grease in the discharge.
F. The discharge of any radiological, chemical, or biological warfare agent or high level radiological waste is prohibited.

IV. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Effluent limitations – Discharge Points – 001, 002, and 003, beginning June 24, 2005:

1. The discharge of wastewater to Lucerne Valley and recycled water reuse for irrigation, construction, and wildlife habitat shall maintain compliance with the following limitations at Discharge Points 001, 002, and 003, with compliance measured at each individual monitoring location as described in the attached Monitoring and Reporting Program (Attachment D). The wastewater shall at all times be oxidized.

FOR DISCHARGE POINTS NO. 001 AND 002			
Parameter	**Units**	**Discharge Limitations**	
		Average Monthly	**Average Weekly**
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	30	45
	lbs/day[1]	1,223	1,835
Total Suspended Solids	mg/L	30	45
	lbs/day[1]	1,223	1,835

FOR DISCHARGE POINT NO. 003			
Parameter	**Units**	**Discharge Limitations**	
		Average Monthly	**Average Weekly**
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	20	30
	lbs/day[2]	167	250
Total Suspended Solids	mg/L	20	30
	lbs/day[2]	167	250

2. The pH of the effluent, measured at each monitoring point, shall at all times be within the range of 6 and 9 pH units.

---

1 Based on a design capacity of 4.89 mgd for secondary treatment.
2 Based on a design capacity of 1.0 mgd for tertiary treatment.

3. Percent Removal: The monthly average biochemical oxygen demand and suspended solids concentrations of the discharge shall not be greater than fifteen percent (15%) of the monthly average influent concentrations.

4. TDS Limitations for Discharge Points 002 and 003: for effluent limitations a. and b., below, the lower of the two total dissolved solids limits is the limit.

   a. The 12-month average[3] total dissolved solids concentration shall not exceed 550 mg/l and the 12-month flow weighted average shall not exceed 22,430 lbs/day[4], and
   b. The 12-month average total dissolved solids concentration shall not exceed the 12-month average total dissolved solids concentration in the water supply by more than 250 mg/l.

5. Total Inorganic Nitrogen (TIN) Limitations: The 12-month flow-weighted average TIN concentration shall not exceed 10 mg/l.

6. For Discharge from Discharge Point 003: Tertiary treated recycled water shall at all times be a filtered and subsequently disinfected wastewater that meets the following criteria:

   a. The turbidity of the filtered wastewater does not exceed any of the following:

      i. for micro-filtration:
         1). 0.2 NTU more than 5 percent of the time within a 24-hour period; and
         2). 0.5 NTU at any time.

      ii. for media filtration:
         1). 2 NTU more than 5 percent of the time within a 24-hour period; and
         2). 5 NTU at any time.

   b. Disinfected tertiary wastewater shall meet the following criteria:

      i. The median concentration of total coliform bacteria measured in the disinfected effluent shall not exceed a most probable number (MPN) of 2.2 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed.
      ii. The number of total coliform bacteria shall not exceed an MPN of 23 per 100 milliliters in more than one sample in any 30-day period.
      iii. No sample shall exceed an MPN of 240 total coliform bacteria per 100 milliliters.

7. For Discharge Point 002: wastewater shall at all times be an oxidized and subsequently disinfected wastewater that meets the following criteria:

   a. The median concentration of total coliform bacteria in the disinfected effluent shall not exceed an MPN of 23 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed[5].

---

[3] See Section VII. D Compliance Determination.
[4] Calculated from 4.89 mgd x 8.34 x 550 mg/l.

b. The number of total coliform bacteria shall not exceed an MPN of 240 per 100 milliliters in more than one sample in any 30-day period.

B. Reclamation Specifications- Discharge Points 002 and 003

1. The use of recycled water shall only commence after final approval for such use is granted by the California Department of Health Services (CDHS). The Discharger shall provide the Regional Board with a copy of the CDHS approval letter within 30 days of the approval notice.

2. The Discharger shall be responsible for assuring that recycled water is delivered and utilized in conformance with this Order, the recycling criteria contained in Title 22, Division 4, Chapter 3, Sections 60301 through 60355, California Code of Regulations, and the "Guidelines for Use of Reclaimed Water" by the California Department of Health Services. The discharger shall conduct periodic inspections of the facilities of the recycled water users to monitor compliance by the users with this Order.

3. The Discharger shall establish and enforce Rules and Regulations for Recycled Water users, governing the design and construction of recycled water use facilities and the use of recycled water in accordance with the uniform statewide recycling criteria established pursuant to the California Water Code Section 13521.

   a. Use of recycled water by the discharger shall be consistent with its Rules and Regulations for Recycled Water Use.

   b. Any revisions made to the Rules and Regulations shall be subject to the review of the Regional Board, the California Department of Health Services, and the County of San Bernardino Department of Environmental Health. The revised Rules and Regulations or a letter certifying that the discharger's Rules and Regulations contain the updated provisions in this Order, shall be submitted to the Regional Board within 60 days of adoption of this Order by the Regional Board.

4. The Discharger shall, within 60 days of the adoption of this Order, review and update as necessary its program to conduct compliance inspections of recycled water reuse sites. Inspections shall determine the status of compliance with the discharger's Rules and Regulations for Recycled Water Use.

5. The storage, delivery, or use of recycled water shall not individually or collectively, directly or indirectly, result in a pollution or nuisance, or adversely affect water quality, as defined in the California Water Code

---

[5] Title 22, 60301.225.

6. Prior to delivering recycled water to any new individual residential user, small commercial, or construction project users in accordance with BBARWA's "Temporary Use Policy for Private Residences", the discharger shall obtain items a. through f. listed below for review and approval by the discharger's supervisor responsible for the operation of the recycled water distribution system. For all other new users, the discharger shall submit to the California Department of Health Services for review and approval a report containing items a. through f. listed below:

   a. The average number of persons estimated to be served at each use site area on a daily basis.
   b. The specific boundaries of the proposed use site area including a map showing the location of each facility, drinking water fountain, and impoundment to be used.
   c. The person or persons responsible for operation of the recycled water system at each use area.
   d. The specific use to be made of the recycled water at each use area.
   e. The methods to be used to assure that the installation and operation of the recycled system will not result in cross connections between the recycled water and potable water piping systems. This shall include a description of the pressure, dye or other test methods to be used to test the system.
   f. Plans and specifications which include following:
      i. Proposed piping system to be used.
      ii. Pipe locations of both the recycled and potable systems.
      iii. Type and location of the outlets and plumbing fixtures that will be accessible to the public.
      iv. The methods and devices to be used to prevent backflow of recycled water into the potable water system.
      v. Plan notes relating to specific installation and use requirements.

7. The user shall designate an on-site supervisor responsible for the operation of the recycled water distribution system. The supervisor shall be responsible for enforcing this Order, prevention of potential hazards, the installation, operation and maintenance of the distribution system, maintenance of the distribution and irrigation system plans in "as-built" form, and for the distribution of the recycled wastewater in accordance with this Order.

V. RECEIVING WATER LIMITATIONS

A. Groundwater Limitations

1. The discharge shall not cause the underlying groundwater to be degraded, to exceed water quality objectives, unreasonably affect beneficial uses, or cause a condition of pollution or nuisance.

2. The discharge, in combination with other sources, shall not cause underlying groundwater to contain waste constituents in concentrations greater than background water quality.

VI. PROVISIONS

A. General Provisions:

1. Neither the treatment nor the discharge of waste shall create, or threaten to create, a nuisance or pollution as defined by Section 13050 of the California Water Code.

2. The discharger shall maintain a copy of this Order at the site so that it is available to site operating personnel at all times. Key operating personnel shall be familiar with its content.

3. The discharger shall take all reasonable steps to minimize any adverse impact to receiving waters resulting from noncompliance with any requirements specified in this Order, including such accelerated or additional monitoring as necessary to determine the nature and impact of the noncomplying discharge.

4. The discharger shall optimize chemical additions needed in the treatment process to meet waste discharge requirements so as to minimize total dissolved solid increases in the recycled water.

5. The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this Order shall not be affected thereby.

6. Collected screenings, sludge, and other solids removed from liquid wastes shall be disposed of in a manner approved by the Regional Board's Executive Officer.

7. If the discharger demonstrates a correlation between the biological oxygen demand (BOD5) and total organic carbon (TOC) concentrations in the effluent to the satisfaction of the Executive Officer, compliance with the BOD5 limits contained in this Order may be determined based on analyses of the TOC of the effluent.

8. In the event of any change in control or ownership of land or waste discharge facility presently owned or controlled by the discharger, the discharger shall notify the succeeding owner or operator of the existence of this Order by letter, a copy of which shall be forwarded to the Regional Board.

9. The treatment facilities shall be designed, constructed, operated, and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

B. Monitoring and Reporting Program Requirements

The Discharger shall comply with the Monitoring and Reporting Program, and future revisions thereto, in Attachment D of this Order. This monitoring and reporting program may be modified by the Executive Officer at any time during the term of this Order, and may include an increase or a reduction in the number of parameters to be monitored, the frequency of the monitoring or the number and size of samples to be collected. Any increase in the number of parameters to be monitored, the frequency of the monitoring or the number and size of samples to be collected may be reduced back to the levels specified in the original monitoring and reporting program at the discretion of the Executive Officer.

C. Special Provisions

1. Construction, Operation and Maintenance Specifications

   a. The discharger's wastewater treatment plant shall be supervised and operated by persons possessing certificates of appropriate grade pursuant to Title 23, Division 3, Chapter 14, California Code of Regulations.

   b. The discharger shall provide safeguards to assure that should there be reduction, loss, or failure of electric power, the discharger will comply with the requirements of this Order.

   c. The discharger shall update as necessary, the "Operation and Maintenance Manual (O&M Manual)" which it has developed for the treatment facility to conform to latest plant changes and requirements. The O&M Manual shall be readily available to operating personnel onsite. The O&M Manual shall include the following:

      i. Description of the treatment plant table of organization showing the number of employees, duties and qualifications and plant attendance schedules (daily, weekends and holidays, part-time, etc). The description should include documentation that the personnel are knowledgeable and qualified to operate the treatment facility so as to achieve the required level of treatment at all times.

      ii. Detailed description of safe and effective operation and maintenance of treatment processes, process control instrumentation and equipment.

      iii. Description of laboratory and quality assurance procedures.

      iv. Process and equipment inspection and maintenance schedules.

      v. Description of safeguards to assure that, should there be reduction, loss, or failure of electric power, the discharger will be able to comply with requirements of this Order.

vi. Description of preventive (fail-safe) and contingency (response and cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events. These plans shall identify the possible sources (such as loading and storage areas, power outage, waste treatment unit failure, process equipment failure, tank and piping failure) of accidental discharges, untreated or partially treated waste bypass, and polluted drainage.

2. Special Provisions for Municipal Facilities (POTWs Only)

a. Sludge Disposal Requirements

i. Collected screenings, biosolids, and other solids removed from liquid wastes shall be disposed of in a manner that is consistent with Chapter 15, Division 3, Title 23, of the California Code of Regulations and approved by the Executive Officer.

ii. The use and disposal of biosolids shall comply with existing Federal and State laws and regulations, including permitting requirements and technical standards included in 40 CFR 503.

iii. Any proposed change in biosolids use or disposal practice from a previously approved practice shall be reported to the Executive Officer and EPA Regional Administrator at least 90 days in advance of the change.

iv. The discharger shall take all reasonable steps to minimize or prevent any discharge or biosolids use or disposal that has the potential of adversely affecting human health or the environment.

VII. COMPLIANCE DETERMINATION

Compliance with the effluent limitations contained in Section IV of this Order will be determined as specified below:

A. Average Monthly Effluent Limitation (AMEL).
If the average of daily discharges over a calendar month exceeds the AMEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). The average of daily discharges over the calendar month that exceeds the AMEL for a parameter will be considered out of compliance for that month only. If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

B. Average Weekly Effluent Limitation (AWEL).

If the average of daily discharges over a calendar week exceeds the AWEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that week for that parameter, resulting in 7 days of non-compliance. The average of daily discharges over the calendar week that exceeds the AWEL for a parameter will be considered out of compliance for that week only.

If only a single sample is taken during the calendar week and the analytical result for that sample exceeds the AWEL, the Discharger will be considered out of compliance for that calendar week. For any one calendar week during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar week.

C. Maximum Daily Effluent Limitation (MDEL).

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

D. Compliance with the 12-month flow weighted average limit under Effluent Limitations.

A. 4. shall be determined by the arithmetic mean of the last twelve monthly averages.

E. Time Interval.

Compliance determinations shall be based on available analyses for the time interval associated with the effluent limitation. Where only one sample analysis is available in a specified time interval (e.g., monthly or weekly average), that sample shall serve to characterize the discharge for the entire interval. If quarterly sample results show noncompliance with the average monthly limit and that sample result is used for compliance determinations for each month of the quarter, then three separate violations of the average monthly limit shall be deemed to have occurred.

F. For Non-Priority Pollutants.

The discharge shall be considered to be in compliance with an effluent limitation, which is less than or equal to the PQL specified in Attachment D of M&RP No. R8-2005-44 if the arithmetic mean of all test results for the monitoring period is less than the constituent effluent limitation. Analytical results that are less than the specified PQL shall be assigned a value of zero.

ATTACHMENT A – DEFINITIONS

Average Monthly Effluent Limitation (AMEL): the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

Average Weekly Effluent Limitation (AWEL): the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

Daily Discharge: Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the Order), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

Maximum Daily Effluent Limitation (MDEL): the highest allowable daily discharge of a pollutant.

ATTACHMENT D– MONITORING AND REPORTING PROGRAM (MRP)

CWC sections 13267 and 13383 authorize the Regional Water Quality Control Board (RWQCB) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, that implement California regulations.

I. GENERAL MONITORING PROVISIONS

A. All sampling and sample preservation shall be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association).

B. Chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the State Department of Health Services or at laboratories approved by the Regional Board's Executive Officer.

C. The discharger shall have and implement an acceptable written quality assurance (QA) plan for laboratory analyses. Duplicate chemical analyses must be conducted on a minimum of ten percent (10%) of the samples, or at least one sample per month, whichever is greater. A similar frequency shall be maintained for analyzing spiked samples.

D. The flow measurement system shall be calibrated at least once per year or more frequently, to ensure continued accuracy.

E. All monitoring instruments and devices used by the discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for greater than a 24-hour period, the discharger shall obtain a representative grab sample each day the equipment is out of service. The discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. In its monitoring report, the discharger shall specify the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.

F. Monitoring and reporting shall be in accordance with the following:

1. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
2. The monitoring and reporting of influent, effluent, and sludge shall be done more frequently as necessary to maintain compliance with this Order and or as specified in this Order.
3. Whenever the discharger monitors any pollutant more frequently than is required by this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the discharge monitoring report specified by the Executive Officer.
4. A "grab" sample is defined as any individual sample collected in less than 15 minutes.

5. A composite sample is defined as a combination of no fewer than eight individual grab samples obtained over the specified sampling period. The volume of each individual grab sample shall be proportional to the discharge flow rate at the time of sampling. The compositing period shall equal the specific sampling period, or 24 hours, if no period is specified.
6. 24-hour composite samples shall be collected continuously during a 24-hour operation of the facility.
7. Daily samples shall be collected on each day of the week.
8. Monthly samples shall be collected on any representative day of each month.
9. Quarterly samples shall be collected by any representative day of March, June, September, and December.
10. Annual priority pollutant samples shall be collected in December.

II. MONITORING LOCATIONS

The Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order:

Discharge Point Name	Monitoring Location Name	Monitoring Location Description
--	M-INF #33	Influent line before Barscreen
001	M-001 #26	Junction Manhole after Holding Ponds
002	M-002 #27	South Balancing Chamber, Pond 14A
003	M-003 #28	Effluent line before pond 14B
--	S-001	Water Supply

III. INFLUENT MONITORING REQUIREMENTS

Monitoring Location M-INF

The Discharger shall monitor the **influent to the facility** at **Monitoring Location M-INF** as follows:

Parameter	Units	Sample Type	Minimum Sampling Frequency
Flow	MGD	Recorder	Continuous
Biochemical Oxygen Demand$_5$	mg/l	24-Hour Composite	Monthly
Suspended Solids	mg/l	24-Hour Composite	Monthly

IV. EFFLUENT MONITORING REQUIREMENTS

Monitoring Locations at M-001, M-002, and M-003

The Discharger shall monitor the effluent at the Monitoring Locations listed above for the following constituents:

Parameter	Units	Sample type	Minimum Sampling Frequency	Sample Location
Flow[1]	MGD	Recorder/totalizer	Continuous	-----
Turbidity[2]	NTU	Recorder	Continuous	M-003
pH	pH unit	Recorder	Continuous	M-001
pH[3]	pH unit	Grab	Daily	M-002 or M-003
Specific Conductivity	µmhos	Grab	Daily	M-001; M-002[3]; M-003[3]
Total Coliform Organisms[3]	MPN per 100m/l	Grab	Daily	M-002 M-003
Biochemical Oxygen Demand$_5$	mg/l	24-Hour composite	Weekly	M-001[4] M-003[5]
Total Suspended Solids	mg/l	24-Hour composite	Weekly	M-001[4] M-003[5]
Total Inorganic Nitrogen	mg/l	24-Hour composite	Monthly	M-001
Total Dissolved Solids[3]	mg/l	24-Hour composite	Monthly	M-002; M-003
Hardness	mg/l	24-Hour composite	Quarterly	M-001
Sodium	mg/l	24-Hour composite	Quarterly	M-001
Chloride	mg/l	24-Hour composite	Quarterly	M-001
Sulfate	mg/l	24-Hour composite	Quarterly	M-001
Total Phosphorous	mg/l	24-Hour composite	Monthly	M-001
EPA Priority Pollutants Metals *(items #1-#13)* see attachment D-11	µg/l		Annually	M-001
Remaining EPA Priority Pollutants *(Volatile Organics items #17-#55)*-see attachment D-11	µg/l	Grab	Annually	M-001

1 The daily flow to each discharge point shall be recorded.
2 Whenever recycled water is discharged or used at Discharge Serial No. 003.
3 Whenever recycled water is discharged or used at Discharge Serial No. 002 *or* 003.
4 The weekly 24-Hour composite sample for BOD_5 and TSS taken from sample location M-001 shall be representative of Serial Discharge No. 001 and 002.
5 The weekly 24-Hour composite sample for BOD_5 and TSS taken from sample location M-003 whenever recycled water is discharged or used at Serial Discharge No. 003.

V. RECLAMATION MONITORING REQUIREMENTS

Whenever recycled water is supplied to a user, the volume and type of recycled water, the user of recycled water, the locations of those sites including the names of the groundwater management zone underlying the recycled water use sites, type of use (e.g. irrigation, industrial, etc) and the dates at which water is supplied shall be recorded. A summary report of water use by groundwater management zones shall be submitted quarterly. This report shall be included in the annual report.

VI. OTHER MONITORING REQUIREMENTS

A. WATER SUPPLY MONITORING

1. Once every three years, a sample of each source of the water supplied to the sewered area shall be obtained and analyzed for the following constituents:

Specific Conductance	Total Dissolved Solids	pH
Sodium	Total Hardness	
Chloride	Nitrate	

2. All of the above constituents shall be expressed in "mg/l" except specific conductance and pH, which shall be expressed in "micromhos/cm" and "pH units," respectively.

3. Monthly reports shall be submitted stating the amount (in percentage or acre-feet) supplied to the sewered area from each source of water and the resulting flow-weighted water supply quality for total dissolved solids, chloride, nitrate, sodium, and total hardness.

B. BIOSOLIDS MONITORING

The discharger shall maintain a permanent log of solids hauled away from the treatment facilities for use/disposal elsewhere, including the date hauled, the volume or weight (in dry tons), type (screening, grit), and destination. This information shall be reported annually.

VII. REPORTING REQUIREMENTS

A. Reporting Requirements

1. All analytical data shall be reported with method detection limit[1] (MDLs) and with identification of either practical quantitation levels (PQLs[2]) or limits of quantitation (LOQs).

2. Laboratory data for effluent samples must quantify each constituent down to the PQLs specified in Attachment "D-9" or to lower PQLs achieved by the discharger. Any internal quality control data associated with the sample must be reported when requested by the Executive Officer. The Regional Board will reject the quantified laboratory data if quality control data is unavailable or unacceptable.

3. Discharge monitoring data shall be submitted in a format acceptable by the Regional Board. Specific reporting format may include preprinted forms and/or electronic media. The results of all monitoring required by this Order shall be reported to the Regional Board, and shall be submitted in such a format as to allow direct comparison with the limitations and requirements of this order.

4. The discharger shall tabulate the monitoring data to clearly illustrate compliance and/or noncompliance with the requirements of the Order.

5. For every item of monitoring data where the requirements are not met, the monitoring report shall include a statement discussing the reasons for noncompliance, and of the actions undertaken or proposed which will bring the discharge into full compliance with requirements at the earliest time, and an estimate of the date when the discharger will be in compliance. The discharger shall notify the Regional Board by letter when compliance with the time schedule has been achieved.

6. The reports for December shall include a roster of plant personnel, including job titles, duties, and level of State certification for each individual.

7. By March 1 of each year, the discharger shall submit an annual report to the Regional Board. The report shall contain both tabular and graphical summaries of the monitoring data obtained during the previous year. In addition, the discharger shall discuss the compliance record and the corrective actions taken or planned that may be needed to bring the discharge into full compliance with the waste discharge requirements. The annual report shall include a summary of the quality assurance (QA) activities for the previous year.

---

[1] The standardized test procedure to be used to determine the method detection limit (MDL) is given at Appendix B, 'Definition and Procedure for the Determination of the Method Detection Limit' of 40 CFR 136.

[2] PQL is the lowest concentration of a substance which can be determined within ± 20 percent of the true concentration by 75 percent of the analytical laboratories tested in a performance evaluation study. Alternatively, if performance data are not available, the PQL is the method detection limit (MDL) x 5 for carcinogens and MDL x 10 for noncarcinogens.

8. The discharger shall assure that records of all monitoring information are maintained and accessible for a period of at least five years from the date of the sample, report, or application. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or by the request of the Regional Board at any time. Records of monitoring information shall include:

   a. The date, exact place, and time of sampling or measurements;

   b. The individual(s) who performed the sampling, and/or measurements;

   c. The laboratory which performed the analyses;

   d. The date(s) analyses were performed;

   e. The individual(s) who performed the analyses;

   f. The analytical techniques or methods used, including any modification to those methods;

   g. All sampling and analytical results, including

      i. units of measurement used;
      ii. minimum reporting limit for the analysis (minimum level, practical quantitation level (PQL));
      iii. results less than the reporting limit but above the method detection limit (MDL);
      iv. data qualifiers and a description of the qualifiers;
      v. quality control test results (and a written copy of the laboratory quality assurance plan);
      vi. dilution factors, if used; and
      vii. sample matrix type.

   h. All monitoring equipment calibration and maintenance records;

   i. All original strip charts from continuous monitoring devices;

   j. All data used to complete the application for this Order; and,

   k. Copies of all reports required by this Order.

   l. Electronic data and information generated by the Supervisory Control And Data Acquisition (SCADA) System.

9. All reports and/or information submitted to the Regional Board shall be signed by a responsible officer or duly authorized representative of the discharger and shall be submitted under penalty of perjury.

10. The discharger, unless otherwise specified elsewhere in this M&RP, shall deliver a copy of each monitoring report in the appropriate format to:

California Regional Water Quality Control Board
Santa Ana Region

B. Self Monitoring Reports (SMRs)

1. At any time during the term of this Order, the State or Regional Water Board may notify the Discharger to electronically submit self-monitoring reports. Until such notification is given, the Discharger shall submit self-monitoring reports in accordance with the requirements described below.

2. The Discharger shall submit quarterly and annual Self Monitoring Reports including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. Quarterly reports shall be due on May 1, August 1, November 1, and February 1 following each calendar quarter; Annual reports shall be due on March 1 following each calendar year.

3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

Sampling Frequency	Monitoring Period Begins On...	Monitoring Period	SMR Due Date
Continuous	June 24, 2005	All	May 1 August 1 November 1 February 1
1 / day	June 24, 2005	Midnight through 11:59 PM or any 24-hour period that reasonably represents a calendar day for purposes of sampling.	"
1/ week	Sunday following June 24, 2005 or on June 24, 2005 if on a Sunday	Sunday through Saturday	"
1 / month	First day of calendar month following June 24, 2005	1st day of calendar month through last day of calendar month	"
1 / quarter	Closest of January 1, April 1, July 1, or October 1 following June 24, 2005	January 1 through March 31 April 1 through June 30 July 1 through September 30 October 1 through December 31	May 1 August 1 November 1 February 1
1 / year	January 1 following June 24, 2005	January 1 through December 31	March 1

5. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations.

6. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the WDRs; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.

7. SMRs must be submitted to the Regional Water Board, signed and certified to the address listed below:

Gerard J. Thibeault, Executive Officer
California Regional Water Quality Control Board
Santa Ana Region
3737 Main Street, Suite 500
Riverside, CA 92501-3348

ATTACHMENT E – FACT SHEET

As described in Section II of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

I. ORDER INFORMATION

The following table summarizes administrative information related to the facility.

WDID	**8 360108001**
Discharger	**Big Bear Area Regional Wastewater Agency**
Name of Facility	**Regional Treatment Plant, Big Bear City**
Facility Address	**122 Palomino Drive**
	Big Bear City, CA 92314
	San Bernardino
Facility Contact, Title and Phone	**Joseph Hanford, Interim Plant Superintendent (909) 584-4018**
Authorized Person to Sign and Submit Reports	**Steven Schindler, General Manager, (909) 584-4018 Joseph Hanford, Interim Plant Superintendent**
Mailing Address	**P. O. BOX 517, 122 Palomino Drive, Big Bear City, Ca 92314**
Billing Address	**SAME**
Type of Facility	**POTW**
Major or Minor Facility	**Major**
Threat to Water Quality	**2**
Complexity	**B**
Pretreatment Program	**N**
Reclamation Requirements	**Producer/User**
Facility Permitted Flow	**4.89 mgd**
Facility Design Flow	**4.89 mgd**
Watershed	**Big Bear Lake**
Receiving Water	**pond in the Baldwin lake, Big Bear Valley Groundwater management zone**
Receiving Water Type	**surface water in the state and groundwater**

A. Big Bear Area Regional Wastewater Agency (hereinafter Discharger) is the owner and operator of Regional Treatment Plant (hereinafter Facility), a POTW.

B. The Facility discharges wastewater to ponds and irrigation and construction sites that overlie the Lucerne Hydrologic Unit (Region 7) or the Big Bear Valley groundwater management zone. The discharges are currently regulated by Order No. 00-12, which was adopted on February 25, 2000 and expired on February 1, 2005.

C. The Discharger filed a report of waste discharge and submitted an application for renewal of its Waste Discharge Requirements (WDRs) on August 25, 2004. Supplemental Information was requested on January 14, 2005 and following in February 2005. Information was received on January and February 2005. A site visit was conducted on April 11, 2005, to observe operations and collect additional data to develop limitations and conditions.

II. FACILITY DESCRIPTION

A. Description of Wastewater and Biosolids Treatment or Controls

Big Bear Area Regional Wastewater Agency (BBARWA) is a joint powers authority consisting of Big Bear City Community Services District, City of Big Bear Lake and San Bernardino County Service Area 53-B. BBARWA owns and operates a Regional Treatment Plant (RTP) located at 122 Palomino Drive, Big Bear City, in the SW¼ of Section 7, T2N, R2E, SBB&N. The RTP is adjacent to the Baldwin Lake and protected by a dike. The RTP is located at elevation of approximately 6714 feet, which is 3 feet above the estimated 100-year flood elevation of the Baldwin Lake.

Discharges from the facility are currently regulated under Order No. 00-12, NPDES No. CA80000344. That Order expired on February 1, 2005 and was not administratively extended. On August 26, 2004, BBARWA submitted a Report of Waste Discharge for the renewal of waste discharge requirements for BBARWA's Regional Treatment Plant (RTP).

The RTP treats commercial and domestic wastes from the City of Big Bear Lake, Big Bear City Community Services District and County Service Area 53-B. In 2003, the total equivalent dwelling units (EDUs) in the service area were 23,800 units with an estimated population of 59,500 on full or part time basis.

The RTP is designed to secondarily treat up to 4.89 million gallons per day (mgd) of wastewater and tertiary treat up to 1.0 mgd of wastewater. The RTP currently treats an annual average flow at 2.2 mgd. Of the effluent flow, up to 0.07 mgd is for recycled water reuse in the Big Bear area and up to 2 mgd is used for irrigation of alfalfa in Lucerne Valley.

The RTP treatment system consists of the following:

1. Preliminary treatment consists of bar screens and an aerated grit chamber;
2. Secondary treatment utilizes oxidation ditches, secondary clarifiers, and symbio process for nutrient removal;
3. Tertiary treatment consists of micro-filtration and/or 6 gpm reverse osmosis;
4. Disinfection of secondary treated effluent is done by chlorination while tertiary treated effluent is disinfected through ultraviolet light;
5. Sludge treatment system consists of sand dewatering bed, dissolved air flotation unit and belt filter press; sludge is hauled away. The discharger added a 20,000 square foot asphalt bed for further sludge drying.

B. Discharge Points and Receiving Waters

As previously noted, the RTP currently discharges 2.2 mgd of secondary treated wastewater and 0.03 mgd tertiary treated wastewater. The treated wastewater is either discharged to one or more of the following Discharge Points:

001. Secondary treated, but non-disinfected effluent is discharged to effluent storage ponds No. 16 and 21 prior to discharged to the pipeline to Lucerne Valley[1], where the effluent is used for irrigation of fodder, fiber and seed crops. If there is no demand of water for irrigation, the recycled water is stored in two earth basins for evaporation/percolation disposal in Lucerne Valley.

002. Secondary treated and chlorinated effluent is stored in pond No. 14A. Stored water is hauled by tanker truck for delivery to individual recycled water users at construction sites.

BBARWA proposes to convert its existing disposal pond located in the Baldwin Lake into a Wildlife Habitat Area (WHA). This area is surrounded by dike separating it from the remainder of the Baldwin Lake. The top of the dike has a general elevation of 6699 to 6700 feet, about 4 feet above lake bottom. When water in the Baldwin Lake exceeds 6700 feet elevation, the diked area is inundated. Secondary treated and chlorinated effluent is proposed for reuse at the WHA when there is little or no water in Baldwin Lake. During wet months, there would be no treated effluent delivered to the proposed WHA.

003. Tertiary treated and UV disinfected wastewater is stored in pond No. 14B. Stored wastewater is trucked or piped to individual recycled water users for landscape irrigation.

The Discharger is authorized to discharge from the following discharge points as set forth below:

Discharge Point	Effluent Description	Discharge Point Latitude	Discharge Point Longitude	Receiving Water	Disposal Site	Recycling Reuse
001	Secondary effluent without disinfection	34 ° 26' 20" N	116 ° 51' 20" W	Lucerne Hydrologic Unit	Storage Ponds in Lucerne Valley	Irrigation in Lucerne Valley
002	Secondary effluent with disinfection	34 ° 16' 10" N	116 ° 49' 00" W	State surface water: a pond in Baldwin Lake; Big Bear Valley groundwater management zone	--	construction and wildlife habitat
003	Tertiary effluent with disinfection	34 ° 16' 10" N	116 ° 49' 00" W	Big Bear Valley groundwater management zone	--	Irrigation

[1] The Colorado River Basin Regional Water Quality Control Board (Region 7) has issued waste discharge requirements for the use of the recycled wastewater in the Lucerne Valley.

The facility location map is shown on Attachment "B".

The flow diagram for the wastewater treatment process is shown on Attachment "C".

C. Stormwater Runoff from this Facility

Stormwater runoff from the RTP discharges into a flood zone, which is located at the east side of the plant. The flood zone is about 630 feet long and 60 to 80 feet wide. The flood zone has a holding capacity of about 75,000 gallons. In heavy storm seasons, there is the possibility of overflow from the flooding zone into offsite surface waters.

D. Summary of Existing Requirements and Self-Monitoring Report (SMR) Data

Effluent limitations/Discharge Specifications contained in the current Order for discharges from **Discharge Points 001 and 002, and** Monitoring Location 001 and 002, and representative monitoring data from the term of the previous Order are as follows:

Parameter (units)	Effluent Limitation			Monitoring Data (From April 1, 2002 – To March 31, 2005)		
	Average Monthly	Average Weekly	Maximum Daily	Highest Average Monthly Discharge	Highest Average Weekly Discharge	Highest Daily Discharge
BOD_5 (mg/l)	30	45	45	16	42	42
Suspended Solids (mg/l)	30	45	45	17	38	38
Electroconductivity	NA	NA	NA	745		1157
pH Daily Average Continuous Recorder (SU)	Daily Minimum 6.5	NA	8.5	7.92		8.20
TDS (mg/l)	550[(1)]	NA	NA	436[(1)]	481	481
Total Inorganic Nitrogen (mg/l)	10[(2)]	NA	NA	5.8	26.5	26.5
Chloride(mg/l)	NA	NA	NA	52	60	60
Iron (mg/l)	NA	NA	NA	0.35		0.35
Manganese (mg/l)	NA	NA	NA	0.47		0.47
Sodium (mg/l)	NA	NA	NA	120		120
Sulfate(mg/l)	NA	NA	NA	50	55	55
Total Phosphorus (mg/l)	NA	NA	NA	3.6		3.6
Coliform MPN (Construction Water)	NA	NA	240[(3)]			>1600
Coliform MPN (Irrigation Water)	NA	NA	240[(3)]			70
Fluoride (mg/l)	NA	NA	NA	0.89	0.99	0.99
Nitrate-N (mg/l)	NA	NA	NA		10.7	10.7

(1) - TDS shall not exceed 12-month flow weighted average concentration of 550mg/l and shall not exceed

12-month average TDS of water supply by 250mg/l.
(2) – Discharge shall not exceed 12-month flow weighted average of 10 mg/l total inorganic nitrogen.
(3) – Discharge shall not exceed 240 MPN for 2 consecutive days.

Parameter (units)	Effluent Limitation			Monitoring Data (From April 1, 2002 – To March 31, 2005)		
	Average Monthly	Average Weekly	Maximum Daily	Highest Average Monthly Discharge	Highest Average Weekly Discharge	Highest Daily Discharge
Antimony (ug/l)	NA	NA	NA	<6.0		
Arsenic (ug/l)	NA	NA	NA	<2.0		
Beryllium (ug/l)	NA	NA	NA	<1.0		
Boron (ug/l)	NA	NA	NA	270		
Cadmium (ug/l)	NA	NA	NA	<1.0		
Chromium-Total Cr (ug/l)	NA	NA	NA	<10		
Lead (ug/l)	NA	NA	NA	<5.0		
Mercury (ug/l)	NA	NA	NA	<1.0		
Nickel (ug/l)	NA	NA	NA	<10		
Selenium (ug/l)	NA	NA	NA	<5.0		
Silver (ug/l)	NA	NA	NA	<10		
Thallium (ug/l)	NA	NA	NA	<1.0		
Zinc (ug/l)	NA	NA	NA	96		
Copper (ug/l)	NA	NA	NA	<50		
VOC's EPA 601/602/603 (ug/l)	NA	NA	NA	ND		

E. Compliance Summary

Data review indicated that wastewater discharges from this treatment plant were in full compliance with waste discharge requirements of Order No. 00-12.

F. Planned Changes

The discharger eliminated two existing surface water discharge outfalls: the East end of Stanfield Marsh Outfall 002 and the Baldwin Lake Stickleback Habitat Outfall 003.

The Discharger proposes to deliver ***disinfected secondary treated wastewater*** to the discharger's existing wastewater disposal pond in the Baldwin Lake for the purpose of converting the pond into a Wildlife Habitat Area (WHA) when Baldwin Lake is dry or has little water in it.

III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

Based on the U.S. Army Corps of Engineers, the discharger's existing disposal pond in the Baldwin Lake is not considered waters of the U.S. Consequently, this Order is issued as a Waste Discharge and Producer/User Water Recycling Requirements.

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

A. Legal Authorities

This Order is issued pursuant to Chapter 5.5, Division 7 of the California Water Code (CWC). This Order serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.

B. California Environmental Quality Act (CEQA)

The project involves the update of waste discharge requirements for an existing facility and, as such, is exempt from the California Environmental Quality Act (Public Resources Code, Section 21100 et. seq.) in accordance with Section 15301, Chapter 3, Title 14, California Code of Regulations.

C. State Regulations, Policies, and Plans

1. **Water Quality Control Plans.**
   The Regional Water Board adopted a Water Quality Control Plan for the Santa Ana River Region (hereinafter Basin Plan) that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. More recently, the Basin Plan was amended significantly to incorporate revised boundaries for groundwater subbasins, now termed "management zones", new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. This Basin Plan Amendment was adopted by the Regional Board on January 22, 2004. The State Water Resources Control Board and Office of Administrative Law (OAL) approved the Amendment on September 30, 2004 and December 23, 2004, respectively. Beneficial uses applicable to Big Bear Valley Groundwater Management Zone are as follows:

Discharge Point	Receiving Water Name	Beneficial Use(s)
001	Lucerne Hydrologic Unit	Based on Region 7's Basin Plan. 1. Municipal supply 2. Industrial supply 3. Agricultural supply

Discharge Point	Receiving Water Name	Beneficial Use(s)
002	A pond in Baldwin Lake; and Big Bear Valley groundwater management zone	Beneficial Uses for Baldwin Lake: Intermittent: 1. Water contact recreation (REC-1), 2. Non-contact water recreation (REC-2), 3. Warm freshwater habitat (WARM), 4. Cold freshwater habitat (COLD), 5. Preservation of biological habitats of special significance (BIOL), 6. Wildlife habitat (WILD), and 7. Rare, threatened or endangered species (RARE). Beneficial Uses for groundwater management zone: Present or Potential: 1. Municipal and domestic supply, and 2. industrial service supply. .
003	Big Bear Valley groundwater management zone	Beneficial Uses for ground water management zone: Present or potential: Municipal and domestic supply, industrial service supply.

2. **Antidegradation Policy.** State Water Board Resolution No. 68-16 requires that existing water quality is maintained unless degradation is justified based on specific findings. The permitted discharge is consistent with the antidegradation provision of State Water Board Resolution No. 68-16.

3. **Monitoring and Reporting Requirements**. Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in Attachment D.

D. Industrial Stormwater Requirements

Pursuant to Section 402(p) of Clean Water Act and Title 40 of the Code of Federal Regulations (CFR) Part 122, 123, and 124, the State Water Resources Control Board adopted general NPDES permits to regulate storm water discharges associated with industrial activities (State Board Order No. 97-03-DWQ) adopted on April 17, 1997. The discharger shall submit notice of intent to be covered under this general permit and develop and implement Storm Water Pollution Prevention Plans to comply with the general NPDES permit.

IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

A. Technology-Based Effluent Limitations

1. Scope and Authority

Regulations promulgated in 40 CFR §125.3(a)(1) require technology-based effluent limitations for municipal Dischargers to be placed in waste discharge requirements based on Secondary Treatment Standards or Equivalent to Secondary Treatment Standards.

The Federal Water Pollution Control Act Amendments of 1972 (PL 92-500) established the minimum performance requirements for POTWs [defined in Section 304(d)(1)]. Section 301(b)(1)(B) of that Act requires that such treatment works must, as a minimum, meet effluent limitations based on secondary treatment as defined by the USEPA Administrator.

Based on this statutory requirement, USEPA developed secondary treatment regulations, which are specified in 40 CFR 133. These technology-based regulations apply to all municipal wastewater treatment plants and identify the minimum level of effluent quality attainable by secondary treatment in terms of biochemical oxygen demand (BOD_5), total suspended solids (TSS), and pH.

2. Applicable Technology-Based Effluent Limitations

Summary of Technology-based Effluent Limitations
For Secondary Treated Effluent Discharge Points for Discharge Point 001 and 002

Parameter	Units	Effluent Limitations	
		Average Monthly	Average Weekly
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	30	45
	lbs/day[2]	1,223	1,835
Total Suspended Solids	mg/L	30	45
	lbs/day[2]	1,223	1,835

Summary of Technology-based Effluent Limitations
For Tertiary Treated Effluent Discharge Points for Discharge Point 003

FOR DISCHARGE SERIAL NO. 003			
Parameter	Units	Effluent Limitations	
		Average Monthly	Average Weekly
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	20	30
	lbs/day[3]	167	250
Total Suspended Solids	mg/L	20	30
	lbs/day	167	250

[2] Based on a design capacity of 4.89 mgd for secondary treatment.
[3] Based on tertiary flow of 1.0 mgd.

B. Water Quality-Based Effluent Limitations (WQBELs)

1. Basin Plan states that pH value for groundwater discharge shall not be raised above 9 or depressed below 6 as a result of controllable water quality factors.

2. The dissolved mineral content of the waters of the region as measured by the total dissolved solids test shall not exceed the specific objectives as a result of controllable water quality factors. The TDS and TIN limitations are the same as those in the prior Order No. 00-12 to protect groundwater quality.

C. Reclamation Specifications

Section 13523 of the California Water Code provides that a regional board, after consulting with and receiving the recommendations from the CDHS and any party who has requested in writing to be consulted, and after any necessary hearing, shall prescribe water reclamation requirements for water which is used or proposed to be used as recycled water, if, in the judgment of the Board, such requirements are necessary to protect the public health, safety, or welfare. Section 13523 further provides that such requirements shall include, or be in conformance with, the statewide uniform water recycling criteria established by the CDHS pursuant to California Water Code Section 13521.

This Order implements Title 22 Code of Regulations, Division 4, Environmental Health. The coliform limitations are set up for secondary and tertiary treated wastewater, respectively. Turbidity limits are set up for tertiary treated wastewater for irrigation.

D. Final Effluent Limitations

Effluent limitations – Discharge Points – 001, 002, and 003, beginning June 24, 2005:

1. The discharge of wastewater to Lucerne Valley and recycled water reuse for irrigation, construction, and wildlife habitat shall maintain compliance with the following limitations at Discharge Points 001, 002, and 003, with compliance measured at each individual monitoring location as described in the attached Monitoring and Reporting Program (Attachment D). The wastewater shall at all times be oxidized.

FOR DISCHARGE POINTS NO. 001 AND 002			
Parameter	**Units**	**Discharge Limitations**	
		Average Monthly	**Average Weekly**
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	30	45
	lbs/day[4]	1,223	1,835
Total Suspended Solids	mg/L	30	45
	lbs/day[4]	1,223	1,835

[4] Based on a design capacity of 4.89 mgd for secondary treatment.

FOR DISCHARGE POINT NO. 003			
Parameter	**Units**	**Discharge Limitations**	
		Average Monthly	**Average Weekly**
Biochemical Oxygen Demand 5-day @ 20°C	mg/L	20	30
	lbs/day[5]	167	250
Total Suspended Solids	mg/L	20	30
	lbs/day[5]	167	250

2. The pH of the effluent, measured at each monitoring point, shall at all times be within the range of 6 and 9 pH units.

3. Percent Removal: The monthly average biochemical oxygen demand and suspended solids concentrations of the discharge shall not be greater than fifteen percent (15%) of the monthly average influent concentrations.

4. TDS Limitations: for effluent limitations a. and b., below, the lower of the two total dissolved solids limits is the limit. The TDS limitations are applicable for DP Nos. 002 and 003.

   a. The 12-month average[6] total dissolved solids concentration shall not exceed 550 mg/l and the 12-month flow weighted average shall not exceed 22,430 lbs/day[7], and
   b. The 12-month average total dissolved solids concentration shall not exceed the 12-month average total dissolved solids concentration in the water supply by more than 250 mg/l.

5. Total Inorganic Nitrogen (TIN) Limitations: The 12-month flow-weighted average TIN concentration shall not exceed 10 mg/l.

6. For Discharge from Discharge Point 003: Tertiary treated recycled water shall at all times be a filtered and subsequently disinfected wastewater that meets the following criteria:

   a. The turbidity of the filtered wastewater does not exceed any of the following:

      i. for micro-filtration:
         1). 0.2 NTU more than 5 percent of the time within a 24-hour period; and
         2). 0.5 NTU at any time.

      ii. for media filtration:
         1). 2 NTU more than 5 percent of the time within a 24-hour period; and
         2). 5 NTU at any time.

---

5 Based on a design capacity of 1.0 mgd for tertiary treatment.
6 See Section VII. D Compliance Determination.
7 Calculated from 4.89 mgd x 8.34 x 550 mg/l.

b. Disinfected tertiary wastewater shall meet the following criteria:

i. The median concentration of total coliform bacteria measured in the disinfected effluent shall not exceed a most probable number (MPN) of 2.2 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed.
ii. The number of total coliform bacteria shall not exceed an MPN of 23 per 100 milliliters in more than one sample in any 30-day period.
iii. No sample shall exceed an MPN of 240 total coliform bacteria per 100 milliliters.

7. For Discharge Point 002: wastewater shall at all times be an oxidized and subsequently disinfected wastewater that meets the following criteria:

a. The median concentration of total coliform bacteria in the disinfected effluent shall not exceed an MPN of 23 per 100 milliliters utilizing the bacteriological results of the last even days for which analyses have been completed[8].

b. The number of total coliform bacteria shall not exceed an MPN of 240 per 100 milliliters in more than one sample in any 30-day period.

V. RATIONALE FOR RECEIVING WATER LIMITATIONS

A. Surface Water

Discharge to Discharge Point 002 to the pond (WHA) in the Baldwin Lake takes place in the dry season when the pond is dry or contains no natural flow. Therefore, no surface water limit is needed.

B. Groundwater

The soils in the on-site storage/holding ponds, and the Wildlife Habitat Area in the Baldwin Lake have low percolation rates. However, there is a potential for percolation for recycled water in the irrigation and construction site areas. Therefore, this order established TDS limits and total inorganic nitrogen limit to protect groundwater quality.

VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS

Sections 13267 and 13383 of the California Water Code authorize the Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program, Attachment D of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the Monitoring and Reporting Program for this facility.

[8] Title 22, 60301.220.

A. Influent Monitoring

To monitor influent flow to protect operation of the treatment plant and to identify any pollutant into the plant. BOD/TSS monitoring is to measure the BOD/TSS removal rate.

B. Effluent Monitoring

To determine compliance with effluent limitations, all parameters established in this Order must be monitored and tested. Other parameters, such as priority pollutants and minerals are also required to be monitored based on Basin Plan.

VII. PUBLIC PARTICIPATION

The California Regional Water Quality Control Board, Santa Ana Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) for BBARWA's Regional Treatment Plant. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the posting of Notice of Public Hearing at Big Bear Lake City Hall on May 25, 2005 and posting of Notice of Public Hearing at the Regional Board website.

B. Written Comments

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments should be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments should be received at the Regional Water Board offices by 5:00 p.m. on **June 6, 2005.**

C. Public Hearing

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date:	**June 24, 2005**
Time:	**9:00 am**
Location:	**City Council Of Loma Linda** **25541 Barton Road** **City Of Loma Linda**

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge and WDRs. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our web address is ***http://www.waterboards.ca.gov/santaana*** where you can access the current agenda for changes in dates and locations.

D. Waste Discharge Requirements Petitions

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board
Office of Chief Counsel
P.O. Box 100, 1001 I Street
Sacramento, CA 95812-0100

E. Information and Copying

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (951) 782-4130.

F. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDRs should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

G. Additional Information

Requests for additional information or questions regarding this order should be directed to Jane Qiu at (951) 320-2008 or jqiu@waterboards.ca.gov.

Appendix B. Recycled Water Overview

RECYCLED WATER POLICY

The SWRCB adopted the Recycled Water Policy (RW Policy) in February 2009, and subsequently amended it in January 2013. The purpose of the policy was to provide the RWQCBs, proponents of recycled water projects, and the public the appropriate criteria to be used in issuing permits for recycled water projects. The RW Policy established more uniform requirements throughout the State and streamlined the permitting process for the vast majority of recycled water projects. Key components of the RW Policy are summarized below.

Component	Description
Recycled Water Targets	200,000 AFY by 2020 300,000 AFY by 2030
Permitting Process	Recycled water irrigation projects permitted within 120 days (except for unusual requirements) without groundwater monitoring component.
Salt and Nutrient Management Plans	Required for all groundwater basins. Includes identification of salt and nutrient sources, assimilative capacity evaluation, load estimates, fate and transport analysis and implementation measures. Includes anti-degradation analysis for recycled water projects.
Landscape Irrigation Project Requirements	Requirements related to controlling water runoff, salt, and soil nutrients. Provisions for streamlined permitting for projects that meet specific criteria related to application rates, oversight, and controls.
RWQCB Groundwater Requirements	Allows RWQCB to impose more stringent requirements for groundwater recharge projects to address site specific conditions.
Anti-degradation Analysis	Requirements for anti-degradation analysis for groundwater recharge and landscape irrigation projects based on the amount of assimilative capacity use by the project.
CEC Monitoring	Requirements for Constituent of Emerging Concern (CEC) monitoring for groundwater recharge projects.

One of the key components of the RW Policy is the requirement for a Salt and Nutrient Management Plan (SNMP). The RW Policy states that SNMPs should be developed to facilitate basin-wide management of salts and nutrients from all sources in a manner that optimizes recycled water use while ensuring protection of groundwater supply and beneficial uses, agricultural beneficial uses, and human health. The Santa Ana Region Basin Plan includes an SNMP, as described later in this Appendix.

SANTA ANA REGION BASIN PLAN

The Basin Plan establishes water quality standards for the ground and surface waters of the region and includes an implementation plan describing the actions by the Regional Board and others that are necessary to achieve and maintain the water quality standards. The Basin Plan provides general narrative objectives for each water body type and specific numeric objectives for total dissolved solids (TDS), hardness, sodium, chloride, total inorganic nitrogen (TIN), sulfate, and chemical oxygen demand (COD). Most Groundwater Management Zones have numeric objectives for only TDS and TIN.

Some waters in the Region have assimilative capacity for additions of TDS and/or nitrogen. If the current quality of a management zone is the same as or poorer than the specified water quality objectives, then that management zone does not have assimilative capacity. If the current quality is better than the specified water quality objectives, then that management zone has assimilative capacity. The difference between the objectives and current quality is the amount of assimilative capacity available. The amount of assimilative capacity, if any, varies depending on the individual characteristics of the waterbody in question and must be reevaluated over time. As part of the agreement to adopt the 2004 Basin Plan Amendment, the affected parties agreed to recompute ambient water quality for the individual management zones every three years and formed the BMPTF to oversee this effort, among other tasks. Since adoption of the 2004 Basin Plan amendment and per Basin Plan requirements, ambient quality and assimilative capacity findings have been, and will continue to be, updated every three years. The current findings are presented in the Recomputation of Ambient Water Quality in the Santa Ana Watershed for the Period 1993 to 2012 (18). However, this process does not currently include assessment of the Big Bear Valley Groundwater Management Zone.

If a discharger proposes to discharge wastes that are at or below the current ambient TDS and/or nitrogen water quality, then the discharge will not be expected to result in the lowering of water quality, and no antidegradation analysis will be required because TDS and nitrogen objectives are expected to be met. If there is assimilative capacity in the receiving waters for TDS, nitrogen or other constituents, a waste discharge may be of poorer quality than the objectives for those constituents for the receiving waters, as long as the discharge does not cause violation of the objectives, and provided that antidegradation requirements are met. However, if there is no assimilative capacity in the receiving waters, the numerical limits in the discharge requirements cannot exceed the receiving water objectives or the degradation process would be accelerated.

Discharges to waters without assimilative capacity for TDS and/or nitrogen must be held to the objectives of the affected receiving waters. In some cases, compliance with management zone TDS objectives for discharges to waters without assimilative capacity may be difficult to achieve. Poor quality water supplies or the need to add certain salts during the treatment process to achieve compliance with other discharge limitations (e.g., addition of ferric chloride) could render compliance with strict TDS limits very difficult. The Regional Board addresses such situations by providing dischargers with the opportunity to participate in TDS offset programs, such as the use of desalters, in lieu of compliance with numerical TDS limits. These offset provisions are incorporated into waste discharge requirements. Provided that the discharger takes all reasonable steps to improve the quality of the waters influent to the treatment facility (such as through source control or improved water supplies), and provided that chemical additions are minimized, the discharger can proceed with an acceptable program to offset the effects of TDS discharges in excess of the permit limits.

The Basin Plan provides for alternative pathways to obtain approval for discharges that do not meet the conditions described previously.

The Basin Plan provides that a discharger may conduct analyses to demonstrate that discharges at levels higher than the objectives would not cause or contribute to the violation of the established objectives. If the Regional Board approves this demonstration, then the discharger would be regulated accordingly.

Another alternative that dischargers might pursue is revision of the TDS or nitrogen objectives, through the Basin Plan amendment process. Consideration of less stringent objectives would necessitate comprehensive antidegradation review, including the demonstrations that beneficial uses would be protected and that water quality consistent with maximum benefit to the people of the State would be maintained. Several dischargers, including Yucaipa Valley Water District in the Yucaipa Basin, have pursued this "maximum benefit objective" approach, leading to the inclusion of "maximum benefit" objectives and implementation strategies in the Basin Plan. Discharges to areas where the "maximum benefit" objectives apply will be regulated in conformance with these implementation strategies. Any assimilative capacity created by the maximum benefit programs will be allocated to the parties responsible for implementing them.

Anti-Degradation Policy

The RW Policy addresses implementation of the Anti-degradation Policy, as it relates to recycled water projects. In general, the Anti-degradation Policy requires protection of groundwaters and surface waters having quality that is better than that established in effective policies. The policy states that high quality waters shall be maintained unless any change will be consistent with the maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial uses and will not result in water quality less than that prescribed in the policies.

Beneficial Uses

The Federal Clean Water Act (CWA) requires states to establish water quality standards for surface waters, consisting of use types and water quality criteria. In California, beneficial uses are established for all waters of the state, including both surface water and groundwater, to specify how that water can be used for the benefit of the public and/or wildlife. The State applies WQOs to protect the beneficial use attributed to the water of the state. Of the beneficial uses recognized in the Santa Ana Region, those that apply to waterbodies in the Big Bear Valley are included in the following table.

Beneficial Use Type	Beneficial Use
Municipal and Domestic Supply (MUN)	Community, military, municipal or individual water supply systems. These uses may include, but are not limited to, drinking water supply.
Agricultural Supply (AGR)	Farming, horticulture or ranching. These uses may include, but are not limited to, irrigation, stock watering, and support of vegetation for range grazing.
Industrial Process Supply (PROC)	Industrial activities that depend primarily on water quality. These uses may include, but are not limited to, process water supply and all uses of water related to product manufacture or food preparation.
Groundwater Recharge (GWR)	Natural or artificial recharge of groundwater for purposes that may include, but are not limited to, future extraction, maintaining water quality or halting saltwater intrusion into freshwater aquifers.
Water Contact Recreation (REC 1) [1]	Recreational activities involving body contact with water where ingestion of water is reasonably possible. These uses may include, but are not limited to, swimming, wading, water-skiing, skin and scuba diving, surfing, whitewater activities, fishing and use of natural hot springs.
Non-contact Water Recreation (REC 2) [1]	Recreational activities involving proximity to water, but not normally involving body contact with water where ingestion of water would be reasonably possible. These uses may include, but are not limited to, picnicking, sunbathing, hiking, beachcombing, camping, boating, tidepool and marine life study, hunting, sightseeing and aesthetic enjoyment in conjunction with the above activities.
Warm Freshwater Habitat (WARM)	Support of warmwater ecosystems that may include, but are not limited to, preservation and enhancement of aquatic habitats, vegetation, fish and wildlife, including invertebrates.
Cold Freshwater Habitat (COLD)	Support of coldwater ecosystems that may include, but are not limited to, preservations and enhancement of aquatic habitats, vegetation, fish and wildlife, including invertebrates.
Preservation of Biological Habitats of Special Significance (BIOL)	Support of designated areas or habitats, including, but not limited to, established refuges, parks, sanctuaries, ecological reserves or preserves, and Areas of Special Biological Significance (ASBS), where the preservation and enhancement of natural resources requires special protection.
Wildlife Habitat (WILD)	Support of wildlife habitats that may include, but are not limited to, the preservation and enhancement of vegetation and prey species used by waterfowl and other wildlife.
Rare, Threatened or Endangered Species (RARE)	Support the habitats of necessary for the survival and successful maintenance of plant or animal species designated under state or federal law as rare, threatened or endangered.
Spawning, Reproduction and Development (SPWN)	Support of high quality aquatic habitats necessary for reproduction and early development of fish and wildlife.

Notes:

1. The REC 1 and REC 2 beneficial use of designations assigned to surface waterbodies in this Region should not be construed as encouraging recreational activities. In some cases, such as Lake Matthews and certain reaches of the Santa Ana River, access to the waterbodies is prohibited because of potentially hazardous conditions and/or because of the need to protect other uses, such as municipal supply or sensitive wildlife habitat. Where REC 1 or REC 2 is indicated as a beneficial use in Table 3-1, the designations are intended to indicate that the uses exist or that the water quality of the waterbody could support recreational uses.

RESTRICTED AND UNRESTRICTED IRRIGATION REGULATIONS

The following section summarizes California Code of Regulations (CCR) Title 22 regulations as well as Santa Ana Basin Plan objectives which will establish regulatory criteria for irrigation projects using recycled water.

CCR – Title 22

Title 22, established and administered by DDW, defines four types of recycled water uses based on the treatment process used and water quality produced. These four types of recycled water are described as follows and as summarized in Appendix B.

- Undisinfected secondary recycled water - Oxidized wastewater that has not been disinfected.
- Disinfected secondary-23 recycled water – Recycled water that has been oxidized and disinfected so that the median concentration of total coliform bacteria in the disinfected effluent does not exceed a Most Probable Number (MPN) of 23 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed, and the number of total coliform bacteria does not exceed an MPN of 240 per 100 milliliters in more than one sample in any 30-day period.
- Disinfected secondary-2.2 recycled water – Recycled water that has been oxidized and disinfected so that the median concentration of total coliform bacteria in the disinfected effluent does not exceed a MPN of 2.2 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed, and the number of total coliform bacteria does not exceed an MPN of 23 per 100 milliliters in more than one sample in any 30-day period.
- Disinfected tertiary recycled water - Filtered and subsequently disinfected wastewater that meets the following criteria:

  (a) The filtered wastewater has been disinfected by either:

  1. A chlorine disinfection process following filtration that provides a contact time (CT) (the product of total chlorine residual and modal contact time measured at the same point) value of not less than 450 milligram-minutes per liter at all times with a modal contact time of at least 90 minutes, based on peak dry weather design flow; or
  2. A disinfection process that, when combined with the filtration process, has been demonstrated to inactivate and/or remove 99.999 percent of the plaque forming units of F-specific bacteriophage MS2, or polio virus in the wastewater. A virus that is at least as resistant to disinfection as polio virus may be used for purposes of the demonstration.

  (b) The median concentration of total coliform bacteria measured in the disinfected effluent does not exceed an MPN of 2.2 per 100 milliliters utilizing the bacteriological results of the last seven days for which analyses have been completed and the number of total coliform bacteria does not exceed an MPN of 23 per 100 milliliters in more than one sample in any 30-day period. No sample shall exceed an MPN of 240 total coliform bacteria per 100 milliliters

Treatment Level	Approved Uses	Total Coliform (median)
Undisinfected Secondary	Fodder, Fiber and Seed Crops	N/A
Disinfected Secondary 23	Pasture for Milking Animals Landscape Irrigation[1] Landscape Impoundment Soil Compaction, Dust Control on Roads and Streets	23/100 mL
Disinfected Secondary 2.2	Surface Irrigation of Food Crops Restricted Recreational Impoundment Surface Irrigation of Orchards, Vineyards	2.2/100 mL
Disinfected Tertiary	Spray Irrigation of Food Crops Landscape Irrigation[2] Unrestricted Recreational Impoundment	2.2/100 mL

Notes:
1. Includes restricted access golf courses, cemeteries, freeway landscapes, and landscapes with similar public access.
2. Includes unrestricted access golf courses, parks, playgrounds, schoolyards, and other landscaped areas with similar access.

Disinfected tertiary recycled water can also be used for industrial purposes. These uses are summarized in Appendix B.

Industrial Use	Approved Uses
Supply for Cooling and Air Conditioning	Industrial or commercial cooling or air-conditioning involving cooling tower, evaporative condenser, or spraying that creates mist. Industrial or commercial cooling or air-conditioning not involving cooling tower, evaporative condenser, or spraying that creates mist
Other Allowed Uses	Flushing toilets and urinals Priming drain traps Structural fire fighting Non-structural fire fighting Industrial process water that will not come into contact with workers Industrial process water that may contact workers Industrial boiler feed water Decorative fountains Commercial laundries Consolidation of backfill material around potable water pipelines Dust control on roads and streets Mixing concrete Flushing sanitary sewers Soil compaction Artificial snow making for commercial outdoor use Cleaning roads, sidewalks, and outdoor work areas Commercial car washes, not heating the water, excluding the general public from washing processes

Impounded Recycled Water Regulations – Fish Hatcheries

Recycled water to be used in a fish hatchery may be categorized as impounded water under Title 22, which specifies the following regulations for impounded water:

- Recycled water used as a source of supply for restricted recreational impoundments and for any publicly accessible impoundments at fish hatcheries shall be at least disinfected secondary-2.2 recycled water.

However, there are no known fish hatcheries in California that are using recycled water to raise fish for human consumption. Additional research would be needed to verify whether this is a viable use of recycled water that there are likely other water quality, environmental, and public health considerations that will be controlling and will require a higher level of treatment.

Recycled Water Operational and On-site Requirements

There are operational and on-site requirements for different beneficial uses per Title 22. The Title 22, Recycled Water Ordinance, and recycled water rules and regulations requirements are discussed in the following sections

Use Area Requirements

Title 22 includes two main requirements that will need to be considered during the design phase. Per Title 22, no irrigation with disinfected tertiary recycled water shall take place within 50 ft of any domestic water supply well unless the well meets certain criteria including:

- An annular seal
- Well housing to prevent recycled water spray from contacting the wellhead

Also per Title 22, no impoundment of disinfected tertiary recycled water shall occur within 100 ft of any domestic water supply well.

Recycled Water Ordinance

The purpose of a Recycled Water Ordinance is to establish a water recycling policy and criteria for its use within the agency's jurisdiction. In general, a Recycled Water Ordinance will accomplish the following:

- Establish Administrative Authority
- Establish approved uses of recycled water
- Define areas of potential eligibility for recycled water service
- Specify mandatory and voluntary uses of recycled water, depending on user classifications
- Require installation of transmission and distribution infrastructure
- Provide enforcement and severability clauses

Recycled Water Rules and Regulations

The Rules and Regulations govern the design, construction, and use of both the distribution system, to be operated by BBARWA and/or Project Team and on-site recycled water systems to be operated by the users. In general, the Rules and Regulations document will include the following elements:

- Responsibilities for the Project Team and Users
- Requirements for the design, installation, and inspection of the distribution systems and on-site recycled water systems
- Application procedures and BBARWA approval process
- Operation, Maintenance, and Management responsibilities for Users and the Project Team
- Cross connection control test procedures

- Employee training requirements
- Prohibitions and Enforcement

INDIRECT POTABLE REUSE VIA GROUNDWATER RECHARGE

The following section summarizes CCR Title 22 regulations for IPR projects through groundwater recharge. It also addresses components of the Santa Ana Basin Plan, Anti-Degradation policy addressed in the RW Policy, and the Sustainable Groundwater Management Act (SGMA) that may impact a groundwater recharge recycling.

CCR – Title 22

In response to current drought conditions in California, Senate Bill 104 was signed into law in March 2014. This bill included a requirement for DDW to adopt emergency regulations for groundwater replenishment using recycled water by June 30, 2014. The current Groundwater Recharge Regulations were adopted as an emergency regulation and became effective June 18, 2014. These regulations have been incorporated in the CCR, Title 22.

The Groundwater Recharge Regulations define a Groundwater Replenishment Reuse Project (GRRP) as a project using recycled municipal wastewater for the purpose of replenishment of groundwater that is designated a source of water supply in a Water Quality Control Plan, or which has been identified as a GRRP by the RWQCB. GRRPs can employ surface spreading basins or subsurface injection methods. The Groundwater Recharge Regulations address the following types of recharge:

- Surface spreading without full advanced treatment (FAT)
- Subsurface application (FAT required for the entire flow)
- Surface spreading with FAT

CCR Title 22, Section 60320.201 defines FAT as "the treatment of an oxidized wastewater . . . using a reverse osmosis (RO) and an oxidation treatment process (AOP) . . . ." According to the Groundwater Recharge Regulations, FAT is the required treatment process for groundwater augmentation using direct injection, unless an alternative treatment has been demonstrated to DDW as providing equal or better protection of public health and has received written approval from DDW.

Both surface spreading and subsurface application are considered to be indirect potable reuse (IPR). The specific regulations for these different methods of groundwater recharge are different. However, the regulations generally address the following elements:

- Source control
- Emergency response plan
- Pathogen control
- Nitrogen control
- Regulated chemicals control
- Initial recycled water contribution (RWC)
- Increased RWC
- Advanced treatment criteria
- Application of advanced treatment
- Soil aquifer treatment (SAT) performance (surface application)
- Response retention time

Several of the key regulatory requirements for groundwater recharge are summarized in Appendix B. Additional descriptions of pathogen controls, retention time and the RWC follows.

Pathogen controls include specific provisions for log reduction of microorganisms and treatment process requirements. The treatment process used to treat recharge water for a GRRP must provide treatment that achieves at least 12-log enteric virus reduction, 10-log Giardia cyst reduction, and 10-log Cryptosporidium oocyst reduction from raw sewage to usable groundwater. The treatment train shall consist of at least three separate treatment processes. For each pathogen (i.e., virus, Giardia cyst, or Cryptosporidium oocyst), a separate treatment process may be credited with no more than 6-log reduction, with at least three processes each being credited with no less than 1.0-log reduction.

The Groundwater Recharge Regulations require a minimum "response retention time" or minimum groundwater travel time of two months between the point of surface application or injection, and the point of extraction. Groundwater travel time can be estimated by various methods, including intrinsic tracer studies, numerical modeling, or analytical modeling. Depending on the method used, the "response time credit" is discounted by different factors. The more rigorous the estimating approach, the more advantageous the discounting factor.

The Groundwater Recharge Regulations require that the ratio of purified recycled water to the total injected water, known as the RWC, be determined periodically, and that it is not to exceed a value determined during the DDW's review of the engineering report and the results of public hearings. Only water that is either a DDW-approved drinking water, or meets certain quality criteria (e.g., does not exceed primary or secondary maximum contaminant levels (MCLs) or notification levels) may be used as diluent water. The Groundwater Recharge Regulations allow the RWC to be 100% if it can be demonstrated that sufficient protections are afforded within the total project design and proposed operational scheme.

Element	Surface Recharge	Subsurface Recharge
Required Treatment Level	Disinfected tertiary	100% RO and AOP treatment for the entire waste stream
Retention time[(1)]	Minimum 2 months (however additional treatment may be required for < 6 months)	Minimum 2 months
Recycled Water Max Initial Contribution (RWC_{max})	Up to 20% disinfected tertiary Up to 100% with RO and AOP	Up to 100% with RO and AOP
Total Nitrogen	Average <10 mg/L	Average <10 mg/L
Total Organic Carbon	Mound < 0.5 mg/L ÷ RWC	< 0.5 mg/L
Dilution water compliance calculation	Based on 120-month running average	Based on 120-month running average
Pathogen Reduction[2]	12-log enteric virus reduction, 10-log Giardia cyst reduction, 10-log Cryptosporidium oocyst	

Notes:
1. Must be verified by a tracer study. An 8-month minimum is required for planning level estimates based on numerical modeling.
2. Minimum of 3 barriers and each barrier must achieve a minimum of 1-log reduction. No barrier can achieve more than 6-log.

SURFACE WATER AUGMENTATION AND DIRECT POTABLE REUSE

The SB 918 approved on September 30th, 2010 and subsequent SB 322 approved on October 8th, 2014 require an advisory group and expert panel to investigate and report to Legislature on the feasibility of developing uniform water recycling criteria for DPR and IPR through surface water augmentation. The final expert panel report on the feasibility of DPR is due to legislature on December 31st, 2016.

Uniform criteria for DPR and IPR through surface water augmentation are not currently in place. As a minimum recycled water feasibility studies should aim to meet the requirements established by groundwater recharge regulations.

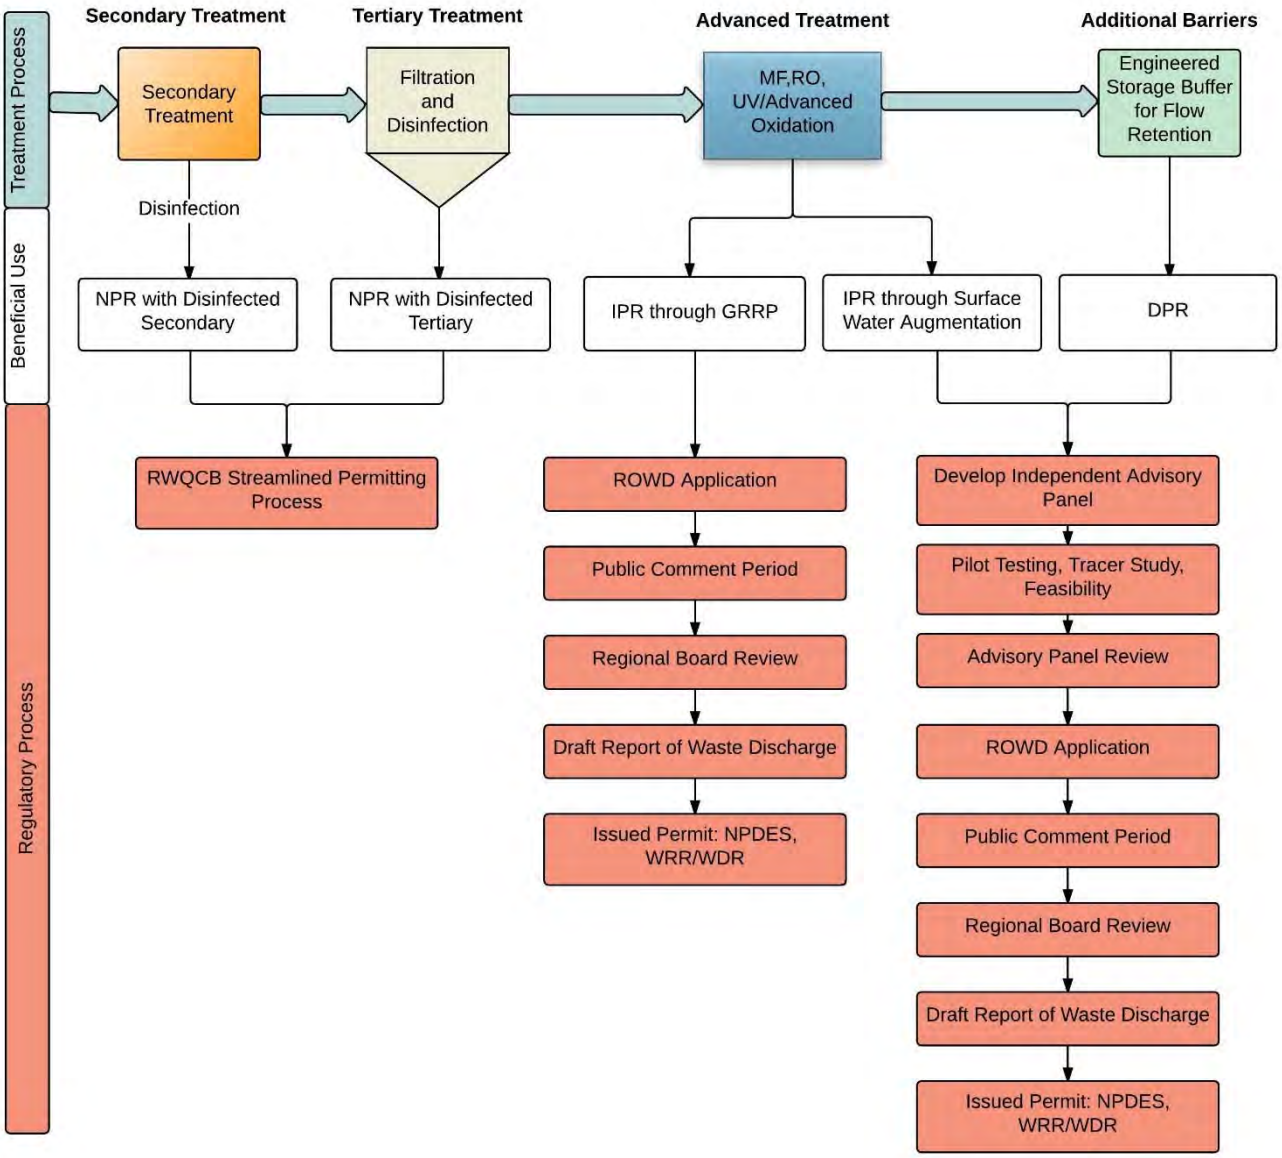
Summary of Permit Requirements

Each type of beneficial reuse or disposal alternative will follow a defined regulatory process to obtain required permits for waste discharge and recycled water reuse. The Waste Discharge Requirements (WDRs) Program regulates point discharges to land or groundwater. Recycled water irrigation and recycled water use are administered under the WRDs Program. The project proponent must file a complete Report of Waste Discharge (ROWD) with the Santa Ana Central to obtain a new or revised WDR. This report must include detailed information about the wastewater treatment facility, description of the discharge type, quality, quantity, interval, and method of discharge, and location of discharge points. The ROWD is reviewed by both the State Division of Drinking Water (DDW) and the RWQCB. A streamlined permitting process is established for irrigation projects. The RW Policy identifies further criteria to provide direction for the SWRCB and RWQCB to permit IPR groundwater recharge and recovery projects. For projects that discharge to the Santa Ana River, a new or revised NPDES permit will be required. Additionally, IPR through surface water augmentation involves a more complicated regulatory process to obtain permitting, including advisory panel review, pilot testing, and tracer studies, as these regulations have not been fully developed. Appendix B provides an overview of the permitting procedure for the various types of recycled water projects.

SUSTAINABLE GROUNDWATER MANAGEMENT ACT (SGMA)

DWR has developed a Strategic Plan for the SGMA program to protect groundwater basins that provide more than half of California's water use in dry years. Under the new groundwater management legislation, DWR released an initial basin prioritization list on January 31, 2015. The Basin prioritization ranking considers the percent of total groundwater use in the basin as well as the overlying population. The Bear Valley basin is ranked as a medium priority basin.

A local agency, combination of local agencies, or county may establish a Groundwater Sustainability Agency (GSA). It is the GSA's responsibility to develop and implement a GSP that considers all beneficial uses and users of groundwater in the basin. DWR will develop regulations for evaluating GSPs and alternatives to GSPs by June 1, 2016 and GSAs must be formed by June 30, 2017. GSAs must develop GSPs with measureable objectives and interim milestones that ensure basin sustainability. A basin may be managed by a single GSP or multiple coordinated GSPs. By January 21, 2022, high and medium priority basins not in critical overdraft must be managed under a GSP.



Treatment Process

Appendix C. Water Reuse Timeline and References

A Timeline of the Evolving Wastewater Management In the Big Bear Valley

September 24, 2003

By

Steven C. Schindler, General Manager

Big Bear Area Regional Wastewater Agency

Preface

The Big Bear Valley has seen an ***evolution of wastewater management*** through:

- the developing Big Bear area organizations involved since 1935;
- developing strategies and plans in treatment and disposal of wastewater;
- developing beneficial uses of treated wastewater, both secondary and tertiary;
- more involvement of the regulatory agencies, permitting these beneficial uses;
- developing concepts for advanced, membrane and ultraviolet-based wastewater treatment;
- pilot testing of artificial surface recharge and through-the-earth percolation to aquifers;
- continuing to support interactive, open-door, education-information communications.

So much has transpired since 1935. BBARWA's open-door, education-information communication activities, such as the Water Summit meetings with the public community invited, leads to an underlying question of, "how did we get to where we are today?" This timeline may help answer that question by illuminating Big Bear Valley's legacy in wastewater treatment.

Reading a chronologically written summary of the ***evolution of wastewater management*** could replace counting sheep. Even transforming it into an outline doesn't quite do it. So, I thought a ***timeline format***, which we are now using successfully in ongoing BBARWA projects, would work.

Laying out events from 1935 to 2003 may have resulted in a few omissions and errors. If any are found, I would appreciate any inputs. I plan to periodically expand this timeline portrayal and will be glad to review and incorporate provided inputs.

Steve Schindler

Timeline Summary of Wastewater Management in the Big Bear Area (Page 1 of 2)

1900's | 1900's | 2000's

This timeline provides a brief pictorial summary of sequential events beginning in 1935 regarding wastewater management in the Big Bear Area.

Steven C. Schindler, 9-12-03
General Manager, BBARWA

Big Bear City Sanitary District (BBCSD) Organized.

Big Bear Lake Sanitation District (BBLSD) Organized.

BBLSD constructed primary treatment plant with oxidation/ percolation ponds at China Gardens.

BBLSD constructed sewers in a portion of Big Bear Lake community.

BBCSD assumed operation of Whispering Forest community septic tank system.

35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99 00 01 02 03

BBCCSD received report on effluent disposal.

BBCCSD agreed to take excess effluent from BBLSD, thereby avoiding enforcement action by RWQCB.

BBCCSD agreed to take increased effluent from BBLSD due to continued overflow/leakage into Big Bear Lake from BBLSD percolation ponds at China Garden.

CSA 53–B organized

Big Bear Valley Wastewater Planning Commission (BBVWPC), a joint association of BBLSD, BBCCSD and San Bernardino County, agreed to prepare a valley-wide plan for sewage treatment, disposal and wastewater management.

RWQCB adopted Basin Plan which prohibited waste discharge from subsurface disposal systems in Big Bear Valley. All existing structures were required to connect to the sewer system by 1977. Exemptions were possible under very limited circumstances.

BBVWPC received report recommending valley-wide treatment and reuse system consisting of greenbelt irrigation on Nelson Ridge with discharge to Baldwin Lake in freezing and inclement weather. BBLSD ponds at Stanfield to be abandoned due to "aesthetic" conditions. All other disposal ponds of BBLSD and BBCCSD to be retained for emergency disposal. BBVWPC to seek regulatory approval and to apply for State and Federal assistance.

BBARWA, a joint powers authorityconsisting of the County of San Bernardino, Big Bear City Community Services District and Big Bear Lake Sanitation District was formed and took over the duties of BBVWPC.

BBARWA received comprehensive wastewater facilities plan regionalizing interceptor sewers, treatment and effluent disposal/management for Big Bear Valley.

BBARWA adopted the 1975 facility plan calling for temporary effluent disposal in Lucerne Valley until such time as a legal and economical means of reuse within Big Bear Valley could be implemented. Regulatory agencies continued to prohibit reuse within Big Bear Valley until then-accepted principles of treatment could assure protection of public health and water quality. BBARWA memorialized its commitment to in-valley reuse in Resolution No. 40, adopted January 6, 1976.

BBARWA updated cost of tertiary treatment in expectation that regulatory authorities might soon reconsider in-valley use.

City of Big Bear Lake incorporated, took over duties of BBLSD and became member of BBARWA.

BBCCSD received report on water resources management plan for Baldwin Lake, to which BBARWA supplied information on costs for a hypothtical reuse of effluent within Baldwin Lake.

BBARWA received report on reuse opportunities within Big Bear Valley that would be created if regulatory authorities changed their "no-discharge" prohibition.

BBARWA updates its reuse opportunities report.

City of Big Bear Lake, Department of Water and Power (DWP) received a report describing how wastewater effluent could be recharged into the groundwaters of Sand Canyon (Moonridge area), complying with proposed State groundwater recharge regulations and supplementing the domestic water supply of the DWP.

BBARWA received a grant from Department of Fish and Game to construct a facility within the 80-acre pond to test the feasibility of using effluent for a wetland wild fowl project. The wetland would also perform tertiary treatment. The ponds were flooded by Baldwin Lake soon thereafter and efforts to locate another project site were unsuccessful. The grant funds were returned to the state.

Expanded On Page 2

BBARWA worked with the Big Bear Municipal Water District and the Natural Heritage Foundation to develop a system for delivering reclaimed water to stickleback ponds at south end of Baldwin Lake and, ultimately, to Stanfield Marsh (not pursued).

BBARWA received costs for a small teriary plant to serve reclaimed water to stickleback ponds in Shay Creek.

San Diego County Water Authority conducted a water repurification feasibility study describing a system and treatment facilities required to ultimately recycle reclaimed wastewater through a domestic water supply reservoir (San Vicente Reservoir) for dilution and insertion into the domestic water system. The proposed treatment processes for both the wastewater and domestic water supply were accepted by State Department of Health Services (DOHS). This acceptance constituted a large breakthrough in DOHS policy and allowed Big Bear area to begin consideration of in-valley reuse, including reuse through Big Bear Lake (not pursued due to better approaches).

BBLSD expanded oxidation/percolation ponds at China Gardens.

BBLSD investigated feasibility of creating wildlife ponds in southern end of Baldwin Lake (not implemented due to local opposition).

BBCSD investigated feasibility of constructing a community collection/treatment and disposal system.

County Service Area (CSA) 53 organized.

Big Bear City Community Services District (BBCCSD) organized.

BBCCSD took over for BBCSD. Voters authorized bonds to construct community sewage system with treatment at the present Big Bear Area Regional Wastewater Agency (BBARWA) site. Disposal was through evaporation in pond located in Baldwin Lake (existing "80"-acre pond).

BBLSD percolation ponds overflowed into Big Bear Lake. Caused near-enforcement action by Regional Water Quality Control Board (RWQCB).

Appendix E. Technical and Financial Assumptions

TECHNICAL ASSUMPTIONS

The table below summarizes the key technical assumptions used to develop the alternatives.

Project Element	Assumption
Dilution Water - Advanced Treated Recycled Water	Advanced treated water qualifies as dilution water will require no dilution water
Dilution Water Sources	Sources are storm water, basin underflow and advanced treated wastewater
Beneficial Yield	Beneficial Yield is equal to the yield entering the recycled water distribution system following the WWTP. It is assumed that 100% of the recycled water recharged is recoverable as supply.
Pipelines	Sized to maintain a headloss gradient of less than 10 ft of headloss per 1000 ft of pipeline during peak hour for irrigation use and average annual for recharge use.
Pump Stations	Capacity based on peak hour demand for irrigation use and average annual for recharge use. (Assumes no gravity system storage) Station efficiency is assumed to be 75% All pumps have Variable Frequency Drives (VFDs)
Storage	Capacity is based on max day demand for irrigation use and average day demand for recharge use
Advanced Treatment Recovery Percentage	The net recovery of water entering the Advanced Treatment process is 85%; 15% is generated as brine.

FINANCIAL ASSUMPTIONS

Planning Level Cost Estimates

The cost opinions (estimates) included in this Study are prepared in conformance with industry practice and, as planning level cost opinions, will be ranked as a Class 4 Conceptual Opinion of Probable Construction Cost as developed by the Association for the Advancement of Cost Engineering (AACE) Cost Estimate Classification System (19). The AACE classification system is intended to classify the expected accuracy of planning level cost opinions, and is not a reflection on the effort or accuracy of the actual cost opinions prepared for the study. According to AACE, a Class 4 Estimate is intended to provide a planning level conceptual effort with an accuracy that will range from -30% to +50% and includes an appropriate contingency for planning and feasibility studies. The conceptual nature of the design concepts and associated costs presented in this Study are based upon limited design information available at this stage of the projects. These cost estimates have been developed using a combination of data from RS Means CostWorks®, recent bids, experience with similar projects, current and foreseeable regulatory requirements and an understanding of the necessary project components. As specific projects progress, the design and associated costs could vary significantly from the project components identified in this Study. Cost opinions are planning level and may not fully account for site-specific conditions that will affect the actual costs, such as soils conditions and utility conflicts.

For projects components where applicable cost data is available in RS Means CostWorks® (e.g. pipeline installation), cost data released in Quarter 4 of 2015, adjusted for San Bernardino, California, is used. Material prices were adjusted in some cases to provide estimates that align closer with actual local bid results. For projects where RS Means CostWorks® data is not available, cost opinions are generally derived from bid prices from similar projects, vendor quotes, material prices, and labor estimates, with adjustments for inflation, size, complexity and location.

Cost opinions are in 2015 dollars (ENR 20 City Average Construction Cost Index of: 10,039 for August 2015).

Markups and Contingencies

For the development of the planning level cost estimates, several markups and contingencies are applied to the estimated construction costs to obtain the total estimated project costs. The markups are intended to account for costs of engineering, design, administration, and legal efforts associated with implementing the project (collectively, Implementation Markup). Contingency accounts for additional construction costs that could not be anticipated at the time of this analysis. A summary of the markups and contingencies applied are presented in the table below.

	Markups and Contingencies
	Construction Subtotal
+	20% of Construction Subtotal for Contingency
+	30% of Construction Subtotal for Non-Potable Reuse Implementation (Alternative 1) 40% of Construction Subtotal for Groundwater Recharge Implementation (Alternatives 2 & 3)
=	**Total Capital Cost**

Excluded cost are as follows:

- Public Information Program. Depending on the relative public acceptability of a major recycled water facility or a group of facilities, there may be a need for a public information program, which could take many different forms. It is recommended that the agencies engage in a proactive public outreach program in coordination with other existing or planned outreach programs.
- Land Acquisition. Additional land and/or easements may need to be acquired in addition to those explicitly accounted for in the cost estimates.

Unit Cost and Net Present Value

Unit costs of the various alternatives are compared using the annual payment method. The unit cost is calculated with this method by adding the annual payment for borrowed capital costs to the annual O&M cost and dividing by the annual project yield. This method provides a simple comparison between alternatives in this RWFPS. The factors described below are used to calculate the unit cost with the annual payment method.

To comply with USDA funding program requirements for a Preliminary Engineering Report, the net present values (NPV) are also calculated for each alternative and treatment option. The NPVs account for capital costs (one-time costs associated with each alternative) and operation and maintenance (O&M) costs (i.e. electrical and maintenance) over a 30-year period. O&M costs are subdivided into Conveyance Pumping Energy costs and Non-Energy costs to enable these costs to be escalated at different rates in the future, recognizing that energy costs are anticipated to rise faster than non-energy costs. Note that unit costs calculated using the NPV will not correspond to the unit costs presented in this report, which are based on the annual payment method.

The assumptions used to calculate the costs for each alternative are summarized in the table below.

Assumption	Current Value	Annual Escalation Rate	Description
Loan Terms	100% loan for 30-year loan term with a 2.2% capital financing rate		Loan term based on CWSRF loan term. Capital financing rate based on SRF previous 10-year average.
Discount Rate			A Discount Rate of 3% is used for the NPV
O&M – Conveyance Pumping Energy	$ 0.14/ KW-hr	3.0 %	Energy escalation based on US Energy Information Administration (USEIA) previous 5-year average electricity rate data for California Commercial rates.
O&M – Non Energy	Varies by facility type, based on capacity or capital cost	2.4%	Non-energy escalation based on California CCI previous 5-year average

Appendix F. Treatment Upgrade Details

ALTERNATIVE 1: DISINFECTED TERTIARY TREATMENT

Alternative 1 requires the RW is treated to disinfected tertiary standards, per the Title 22 Code of Regulations as follows:

- Filtered through a process the produces tertiary effluent with a turbidity that does not exceed an average of 2 NTU within a 24-hour period, 5 NTU (0.2 NTU for MF) more than 5% of the time within a 24-hour period, or 10 NTU at any time (0.5 NTU for MF).
- Disinfected to produce effluent that does not exceed an average MPN of 2.2 per 100 mL in past 7 days or an MPN of 23 per 100 mL in any one sample in past 30 days, and never exceeds an MPN of 240 total coliform bacteria per 100 mL.

The new treatment processes required at the BBARWA WWTP to produce disinfected tertiary include:

- Tertiary filtration
- Disinfection

A process flow diagram (PFD) for Alternative 1 is shown below and each process is described in more detail in the following subsections. The new facilities required for this alternative are outlined in blue.

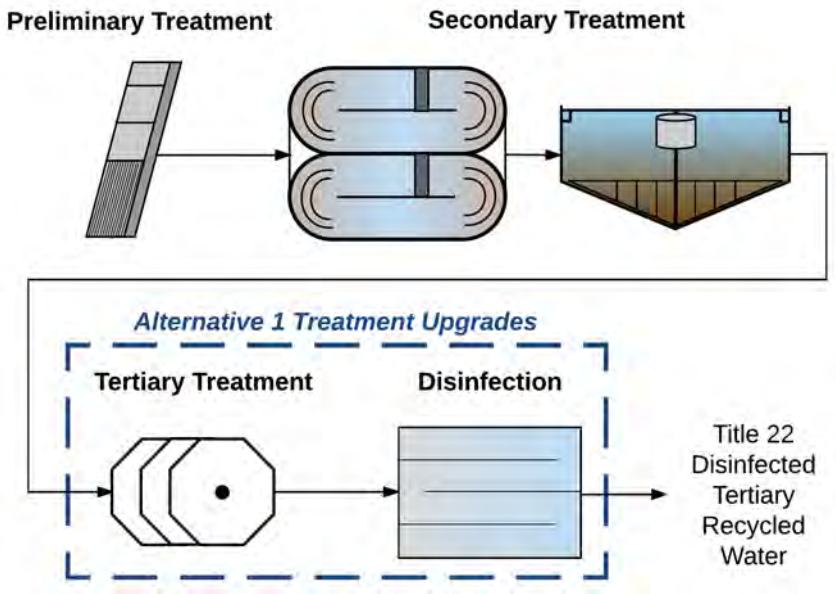

Figure 10-1 Treatment Process Flow Diagram for Alternative 1

Tertiary Filtration

Tertiary filtration is intended to remove TSS from secondary effluent prior to the disinfection process. Either surface filtration or depth filtration mechanisms may be used to perform tertiary filtration. Surface filtration units include cloth-medium surface filters, and depth filtration includes upflow and down flow media filters. Cloth media filters were selected as the tertiary filtration process because the technology is offered by multiple vendors, easy to operate and low cost. Cloth media filter units have a compact footprint and the process can be easily expanded to include additional modules for treating the total Alternative 1 reuse demand of 0.24 MGD.

The surface filtration mechanism of a cloth media filter works by an outside-in pattern of the secondary effluent wastewater flow. The cloth media filters operate submerged, rotating slowly as the water filters through the surface of the cloth, depositing solids on the outside of the media while allowing filtered water (filtrate) to flow by gravity to the effluent channel. Backwash of the cloth media filters is initiated when the solids deposited on the cloth media create too much headloss. During backwash, the flow is reversed as the cloth filters continue to rotate and vacuum suction manifolds are turned on to remove solids that were deposited on the media surface. Intermittent shutdowns are required for more intensive backwash events to remove solids that are not removed from standard backwash cycles. The effluent channel is hydraulically separated from the process tank so headloss can be measured using the water level in the effluent channel. A photo of a cloth media filter unit is shown below.

Operational characteristics that govern design of cloth filters include average and peak hydraulic loading rates (HLR). CDPH has established an allowable peak HLR of 6 gpm/sf for many of the approved cloth surface media filters, although different HLRs may be permitted for varying models of the process. Typically, cloth media filters operate between 2 to 5 gpm/sf during average conditions.

Disinfection

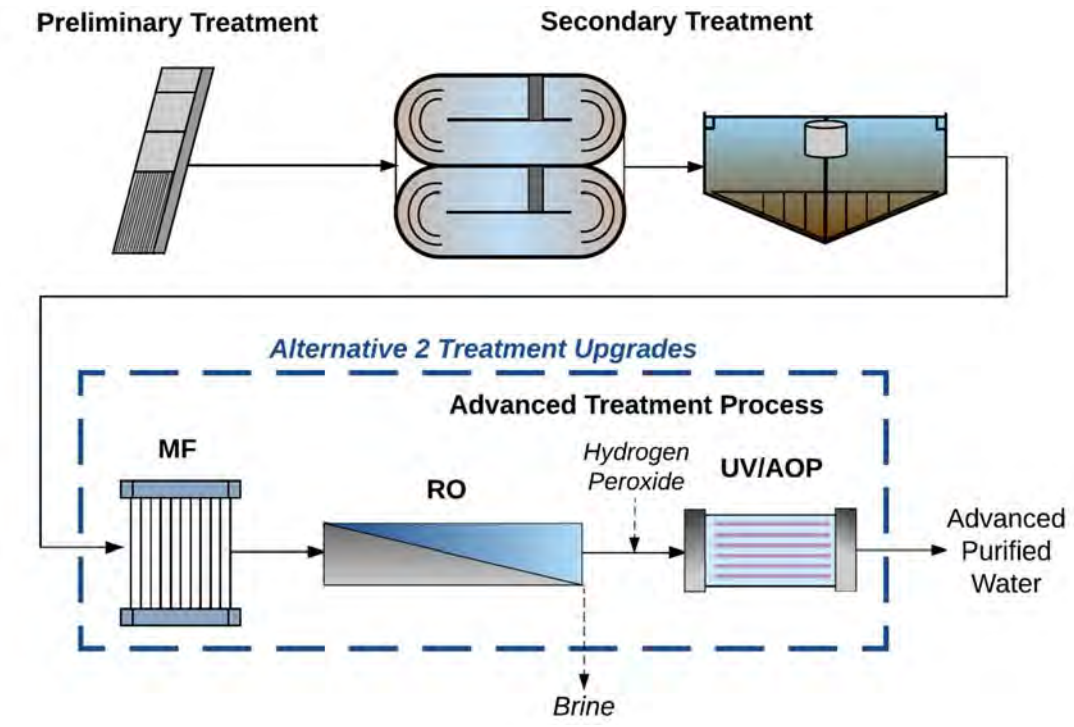
Title 22 standards require the RW used for unrestricted landscape irrigation is "filtered" and "disinfected". The disinfection process is intended to remove and inactivate viruses, bacteria and protozoa from the wastewater to make it safe for RW uses. The most common disinfection processes used for wastewater treatment are ultraviolet disinfection, ozonation and chlorination. Chlorination was selected as the disinfection process because the BBARWA staff is familiar with chlorine dosing systems, and chlorination provides adequate disinfection to reliably produce disinfected tertiary RW.

ALTERNATIVE 2: ADVANCED TREATMENT UPGRADES

For Alternative 2, BBARWA's existing secondary treatment and clarification facilities are assumed to be sufficient for adequate BOD and TSS removal prior to tertiary treatment. The secondary effluent from the existing WWTP would be fed to the advanced treatment process train consisting of:

1. Microfiltration/ultrafiltration (MF/UF)
2. Reverse Osmosis (RO)
3. Ultraviolet Advanced Oxidation (UV/AOP)
4. Brine Reduction

The combination of MF, RO and UV/AOP is considered the conventional indirect potable reuse treatment train. This treatment train meets the criteria in the DDW Regulations Related to Recycled Water (Title 22, Article 5.2). A PFD for Alternative 2 is shown below. The new facilities required for this alternative are outlined in blue.



Microfiltration

MF membranes are an efficient technology for particle removal and pathogen control either in a pressurized or submerged configuration. For the former, water is pumped through the membranes in modules or cartridges. In the latter form, membranes are submerged in tanks and water is pulled through the membranes by vacuum. Overall, membrane filtration provides a near absolute barrier to suspended solids and microorganisms.

For this analysis, pressurized MF membranes were assumed as they generally provide greater efficiency and lower operating costs at this flow range. As water is pushed through the membranes using feed pumps, the suspended solids and microorganisms are retained on the outside of the membrane. As long as the integrity of the membranes are maintained, MF finished water turbidities will be consistently below 0.1 NTU, independent of feed water quality. Due to high-quality effluent produced, MF has been shown to be the preferred pretreatment for RO systems treating wastewater.

Reverse Osmosis

High-pressure membrane processes, such as RO, are typically used for the removal of dissolved constituents including both inorganic and organic compounds. RO is a process in which the mass-transfer of ions through membranes is diffusion controlled. The feed water is pressurized, forcing water through the membranes, thereby concentrating the dissolved solids that cannot pass through the membrane. Consequently, these processes can remove salts, hardness, synthetic organic compounds, disinfection by-product precursors, etc. However, dissolved gases such as hydrogen sulfide (H_2S) and carbon dioxide, and neutral low molecular weight molecules, pass through RO membranes. The rejection by the RO membranes (removal efficiency) is not the same for all dissolved constituents, and is influenced by molecular weight, charge, and other factors.

RO is considered a high-pressure process because it operates from 75 to 1,200 psig, depending upon the TDS concentration of the feed water. Typical operating pressure in a wastewater application is in the range of 150 to 250 psi. Recoveries for RO plants operating on domestic wastewater are around 85 percent depending on the type and concentrations of sparingly soluble salts (calcium sulfate, calcium carbonate, calcium phosphate, silica, etc.) in the feed water. Silica can permanently scale RO membranes when its concentration in the process exceeds about 100 to 120 mg/L. In wastewater applications, calcium phosphate can often be the salt controlling overall recovery.

One of the issues with the RO process is discharge of the concentrate stream. The TDS removed from the feed water is concentrated in the brine stream and needs to be disposed. See Brine Reduction and Disposal.

Ultraviolet Advanced Oxidation Process

In general, advanced oxidation processes are processes that rely on chemical reactions with hydroxyl or other radicals to remove organic compounds in water. For a UV-based advanced oxidation process, a chemical oxidant is added to the process, and with exposure to the UV light, hydroxyl or other radicals are formed. The hydroxyl or other radicals are high-energy, highly reactive molecules that attack chemical bonds of organic molecules and oxidize them. UV/AOP is effective at oxidizing certain CECs such as certain endocrine disrupting compounds, PPCPs, and other microconstituents such as 1,4-dioxane and N-nitrosodimethylamine (NDMA) that can be found in wastewater effluents. In addition, with a UV/AOP process, the UV dose required for radical formation is greater than required for disinfection. Thus, a UV/AOP process provides both a disinfection barrier as well as a microconstituent barrier.

There are several chemical oxidants that can be used in combination with UV to achieve advanced oxidation. Hydrogen peroxide (H2O2) is a common oxidant used for advanced oxidation. Other chemical oxidants that can be combined with UV include ozone and hypochlorite. Each of these chemical oxidants have advantages and disadvantages.

Brine Reduction and Disposal

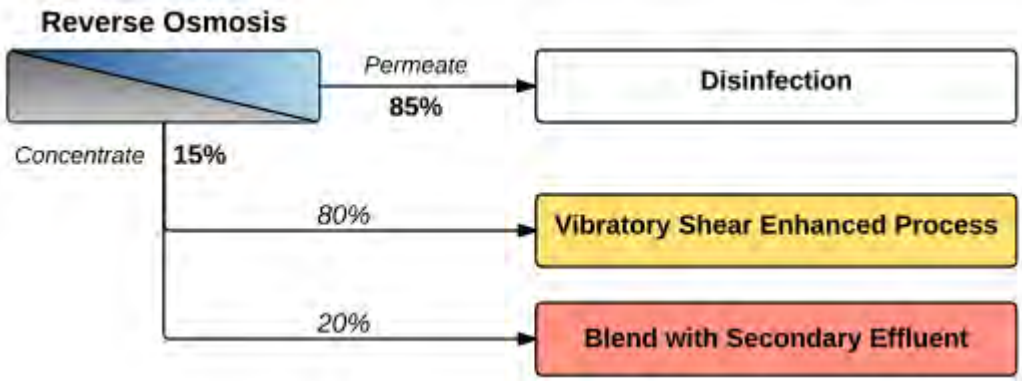
VSEP for Brine Reduction

Vibratory Shear-Enhanced Processing (VSEP), a patented process of New Logic, was developed to reduce polarization of suspended colloids and sparingly soluble salts on the membrane surface by introducing shear to the membrane surface through vibration.

The VSEP consists of four components: driving system than generates vibration, a membrane module, a torsion spring that transfers vibration to the membrane module and a system for controlling vibration. The vibration imparts a shear to the surface of the membrane to mitigate fouling and scaling that would occur in a conventional RO system. The membrane module houses a stack of flat membrane sheets (filter pack) in a plate and- frame type configuration.

Unlike conventional RO systems, VSEP is not limited by the solubility of minerals or the presence of suspended solids. It can be used in the same applications as crystallizers or brine concentrators and is capable of high recoveries (up to 90 percent). The VSEP system can be configured employing either RO or NF membranes in a single-stage or multiple-stage arrangement. The configuration depends upon quality of the wastewater to be treated, water quality goals for the VSEP permeate, and target water recovery, making it a viable option for brine reduction.

Based on the results of this study and pilot testing of brine treatment and disposal alternatives for the BBARWA WWTP, the recommended method of brine disposal was effluent mixing coupled with brine reduction and evaporation ponds (16). Under this scenario, a portion of the brine would be mixed with the secondary effluent that is discharged to the LV Site for irrigation. The portion of brine that is mixed would be limited to ensure that the effluent meets the discharge requirements of the Colorado WDR permit for the LV Site. For the remaining brine, VSEP would be used to reduce the volume of concentrate. The reduced concentrate would then be conveyed to new, lined evaporation ponds on the LV Site. A smaller brine pipeline would be installed inside the existing discharge pipeline to the LV Site. A simplified PFD depicting this scenario is presented below.

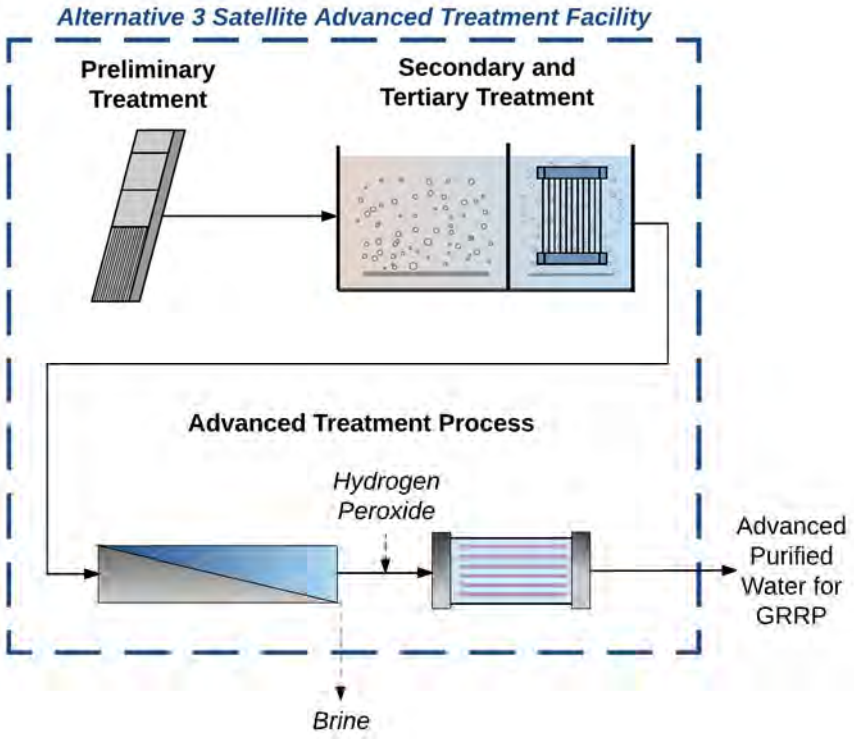


ALTERNATIVE 3: SATELLITE ADVANCED TREATMENT PLANT

For Alternative 3, a new satellite WWTP would be constructed near BBARWA's existing Lake Pump Station. The new treatment processes required for this alternative include:

1. Primary Treatment
2. Secondary and Tertiary Treatment. A Membrane Bioreactor (MBR) process is assumed.
3. Reverse Osmosis (RO)
4. Ultraviolet Advanced Oxidation (UV/AOP)
5. Brine Disposal

The combination of MBR, RO and UV/AOP is considered a conventional indirect potable reuse treatment train. This treatment train meets the criteria in the DDW Regulations Related to Recycled Water (Title 22, Article 5.2). One of the issues with the RO process is that the TDS removed from the feed water is concentrated into a brine stream that needs to be disposed of. A PFD for Alternative 3 is shown below. The new facilities required for this alternative are outlined in blue.



Preliminary Treatment

Preliminary treatment is required to remove debris such as branches and trash, and inert solids such as grit. The removal of these materials is necessary to protect downstream equipment and improve performance of downstream processes. For Alternative 3, it is assumed the preliminary treatment process would consist of a mechanical bar screen, a coarse air grit tank and a fine screen.

Large debris is typically removed using mechanical bar screens that trap objects in front of bars spaced 1-in. to 2-in. apart and remove the material with mechanical rakes. Grit and inorganic solids are removed using either coarse aeration or mechanical vortex grit tanks. The mechanisms for grit removal suspend the organic solids that are finer and lighter, while the coarse, heavy solids settle to the bottom of the tank to be removed through a hopper.

Fine screening is required for MBR treatment applications to remove small abrasive solids that have the potential to damage the membrane fibers. Fine screens are placed immediately upstream of the biological treatment and MBR tanks (secondary and tertiary treatment). The physical straining of fine solids is performed by passing the flow through 0.01-in. to 0.25-in. openings in drum, band, or static screen surfaces. The retained solids are continually washed off or transferred to a solids conveyance belt for processing.

Membrane Bioreactor

MBRs are an established technology for particle removal and pathogen control, intended for application downstream of an activated sludge process. MF modules are submerged in tanks and water is pulled through the membranes by filtrate pumps. Membrane filtration provides a near absolute barrier to suspended solids and microorganisms.

For this analysis, MBRs were assumed because the satellite plant will likely include a pre-constructed secondary process unit equipped with an activated sludge process and MBR unit. As water is filtered through the membranes, the suspended solids and microorganisms are retained on the outside of the membrane. As long as the integrity of the membranes are maintained, MBR effluent turbidities are consistently below 0.1 NTU, independent of feed water quality. Due to high-quality effluent produced, MBRs have been shown to be the preferred pretreatment for RO systems treating wastewater.

However, there are currently no pathogen log reduction credits in place for an MBR with DDW for the purposes of permitting a groundwater recharge project. The lack of credits is attributed to the inability to perform proper membrane integrity testing on the MBR membrane that is commonly performed on tertiary MF or UF membranes. It is anticipated that some level of pathogen log reduction credits will be in place for MBRs in the near future, but additional treatment processes may be required if MBR treatment receives insufficient credits.

Reverse Osmosis

A description of the reverse osmosis process is included in the Treatment Upgrade Details for Alternative 2 earlier in this Appendix.

Ultraviolet Advanced Oxidation Process

A description of the UV/AOP process is included in the Treatment Upgrade Details for Alternative 2 earlier in this Appendix.

Brine Disposal

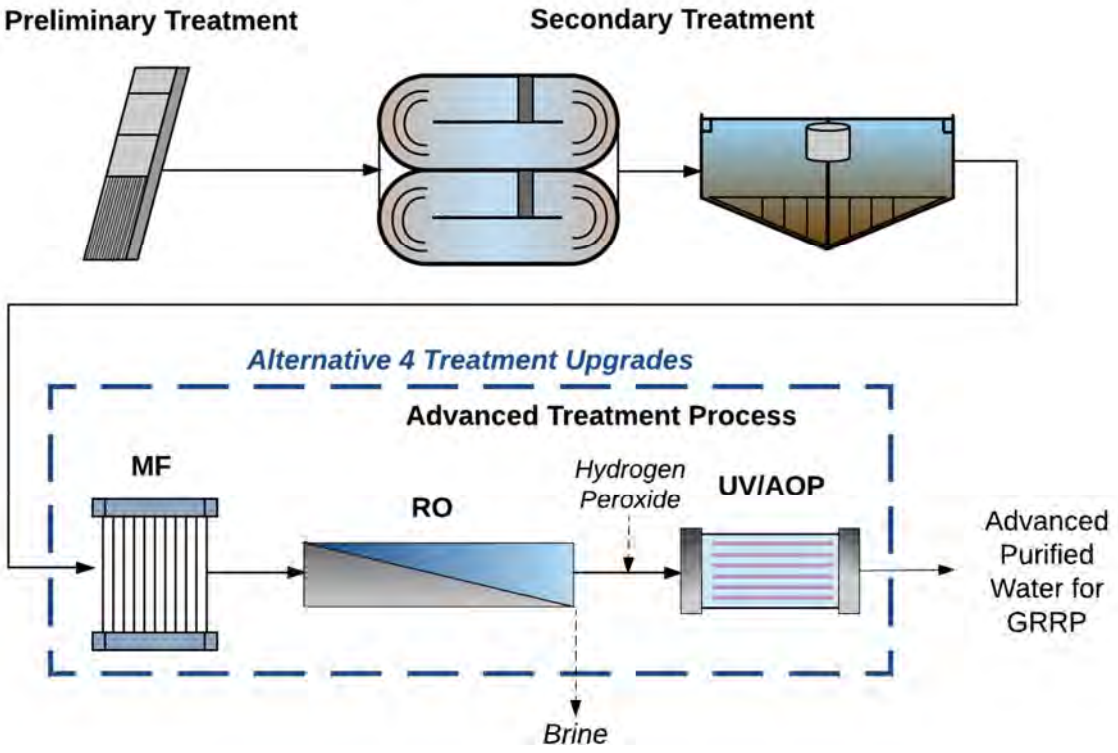
It is assumed the brine stream from the satellite advanced treatment system will be delivered back to the wastewater collection system to be managed at the BBARWA WWTP.

ALTERNATIVE 4: ADVANCED TREATMENT UPGRADES

The treatment upgrades required for implementation of Alternative 4 are identical to Alternative 2, but at a larger scale. The new treatment processes required for Alternative 4 are:

1. Microfiltration/ultrafiltration (MF/UF)
2. Reverse Osmosis (RO)
3. Ultraviolet Advanced Oxidation (UV/AOP)
4. Brine Reduction

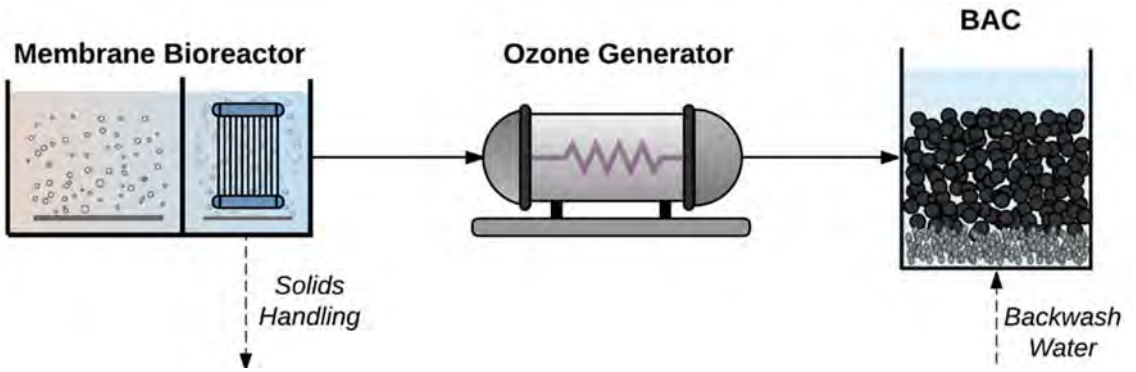
Refer to the Treatment Upgrade Details for Alternative 2 for details of the treatment upgrades required for Alternative 4. A PFD for Alternative 4 is shown below. The new facilities required for this alternative are outlined in blue.



ALTERNATIVE ADVANCED TREATMENT TECHNOLOGIES

As an inland community, the Big Bear Agencies' most significant barrier to implementing an alternative with advanced treatment is the cost of brine management. Unlike coastal communities, the Big Bear Valley does not have the advantage of discharging brine to the ocean. Communities similar to the Big Bear Valley often identify brine management costs as a financial barrier to implementing the project, which highlights the need for alternative advanced treatment technologies for potable reuse applications. Engineering professionals and organizations such as WateReuse have responded to this need by initiating research projects to evaluate alternative advanced treatment train performance compared to the conventional MBR-RO-UV/AOP treatment train.

A potential alternative advanced treatment technology for the BVWSP consists of an MBR or MF, followed by ozone oxidation and biologically activated filtration (BAF), as shown in the figure below.



This alternative advanced treatment process has shown promise for effective TOC, pathogen and synthetic compound removal in cold climates such as Colorado. Despite the performance capabilities of alternative treatment technologies such as the MBR-Ozone-BAF train, without a physical mechanism for removing and separating salts from the effluent stream, the TDS of the RW would likely be too high to be permitted for artificial recharge anywhere in the Big Bear Valley Groundwater Management Zone. It is recommended the Big Bear Agencies investigate local brine management as a means of reducing the brine management costs associated with the advanced treatment alternatives considered for the BVWSP. The SAWPA BMPTF can assist the Bear Valley Agencies in initiating an assimilative capacity study for TDS in the Big Bear Valley Groundwater Management Zone. The results of the assimilative capacity study can be used to quantify the TDS removal requirements of the advanced treatment system and refine the costs of the BVWSP artificial recharge alternatives. Based on the results of the study, it is possible only a sidestream of the RW would need to undergo RO treatment, which would save significant capital and O&M costs.

Appendix H. Scoring Criteria Definitions

Qualitative & Non-Economic Evaluation Criteria

Definitions for each screening criteria and the corresponding scoring approach is described below.

1. **Promotes Water Supply Resiliency**: This criterion focuses on the benefits for improving water resource management and resiliency of water supply.
   3 = Significantly enhances management of water resources or supply resiliency
   2 = Provides some benefit for the management of water resources or supply resiliency
   1 = Does not affect management of water resources or supply resiliency

2. **O&M Complexity:** Focuses on the complexity of operating the treatment, distribution & administrative aspects of the alternative.
   3 = Simple O&M
   2 = Moderately complex O&M
   1 = Complex O&M

3. **Ease of Implementation:** Focuses on the construction sequencing, constructing phasing, jurisdictional considerations, permit acquisition and the ease of implementing the alternative.
   3 = Few barriers to implementation
   2 = Somewhat difficult to implement
   1 = Difficult to implement

4. **Benefit to Bear Valley Community:** Potential for the project to provide social, environmental, and water supply benefits to the Bear Valley community.
   3 = Significant benefit to the community
   2 = Moderate benefit to the community
   1 = Minimal benefit to the community

Project: Bear Valley Water Sustainability Project

SUBJECT: **DRAFT - FISH HATCHERY AND CONSTRUCTED WETLANDS CONCEPTS**

Purpose

The purpose of the Fish Hatchery and Constructed Wetlands Concepts Technical Memo is to explore the viability of developing a recirculating fish hatchery near the BBARWA WWTP that utilizes recycled water to provide community benefits for the Big Bear Valley and potentially offset project costs for the Bear Valley Water Sustainability Project. Specifically, this memo summarizes the research compiled, sources gathered, and calculations conducted regarding the fish hatchery and treatment wetlands concepts. It should be noted that the results presented here reflect concept level analysis based primarily on empirical formulas. It is recommended that the Project team engage wetlands and fish hatchery experts to advance these concepts into the planning phase.

Fish Hatchery Concept

Existing Hatcheries

While preparing considering elements for the Big Bear hatchery concept, two California Department of Fish and Wildlife (CDFW) hatcheries operating nearby were evaluated for comparison. The data summarized in Table 1 present operation data for the Mojave River Hatchery and the Fillmore Trout Hatchery operate. The data was gathered through conversations with hatchery staff.

Table 1. CDFW Fish Hatchery Summary

Characteristic	Mojave River Hatchery	Fillmore Trout Hatchery
Fish Type	Primarily rainbow trout	Primarily rainbow trout
Annual Fish Production (lbs)	~360,000 to 400,000+	~320,000
Hatchery Flows (gpm)	6,500+	4,500 to 6,500+
Hatchery Configuration	6 raceways, 10’ wide, 1,000’ long	4 raceways, 10’ wide, 1,000’ long
Ponds per Raceway	10, in series	10, in series
Staffing Requirements	7 to 8 FTE plus occasional seasonal workers	6 to 7 FTE plus up to 2 seasonal workers
Source Water	Pumped underflow from Mojave River	Pumped groundwater
Discharge Water Treatment	Settling	None
Discharge Water Uses	Return flow, irrigation, recreation	Irrigation on adjacent farms

Conceptual Big Bear Hatchery and Wetlands

Figure 1 shows the conceptual layout of a potential Big Bear Hatchery at the BBARWA WWTP. It includes a constructed treatment wetland and a flow-through fish hatchery with tertiary treatment and recirculation. Depending on the chosen configuration for the remaining WWTP processes, treatment of blend water using constructed wetlands could potentially reduce size of a microfiltration facility, but there could also be regulatory and public perception challenges.

This analysis is based on a conceptual trout hatchery that produces 150,000 lbs of fish per year. These fish would be mostly 10" long and weigh approximately 0.45 lbs/fish (2.2 fish per lb). To determine the sizing of the wetlands, the hatchery flows are calculated first as fish production is the desired outcome. Figure 2 summarizes general trout hatchery water quality criteria. The water quality criteria affect the amount of treatment required through the wetlands.

Table 5. Water Quality Criteria for Trout Hatchery Water Supplies.

Parameter	Desirable Level
Dissolved oxygen	near saturation
Carbon dioxide	< 2.0 ppm
Temperature	45-65°F
pH	6.5-8.5
Total Alkalinity (as $CaCO_3$)	10-400 ppm
Manganese	<0.01 ppm
Iron	<1.0 ppm
Zinc	<0.05 ppm
copper	<.006 ppm in soft water <0.3 ppm in hard water

Figure 1. Water Quality Parameters (Shelton 5)

It should be noted that even low concentrations of ammonia, although not shown in Figure 2, can be toxic to fish. Unionized ammonia (NH_3) levels depend on water chemistry (pH, alkalinity, and temperature). The rule of thumb is that NH_3 concentrations greater than 0.02 mg/L could be toxic to fish (5. Water Quality: Ammonia). Percent of total ammonia in freshwater based on water chemistry is summarized in Figure 3.

Table 8. Percent of Total Ammonia in the Unionized (NH_3) Form in Freshwater at Varying pH and Water Temperatures.

	TEMPERATURE		
pH	60°F	50°F	68°F
7.0	0.19	0.27	0.4
7.5	0.59	0.85	1.24
8.0	1.83	2.65	3.83
8.5	5.55	7.98	Il.18

Figure 2. Percent of Unionized Ammonia (Shelton 9)

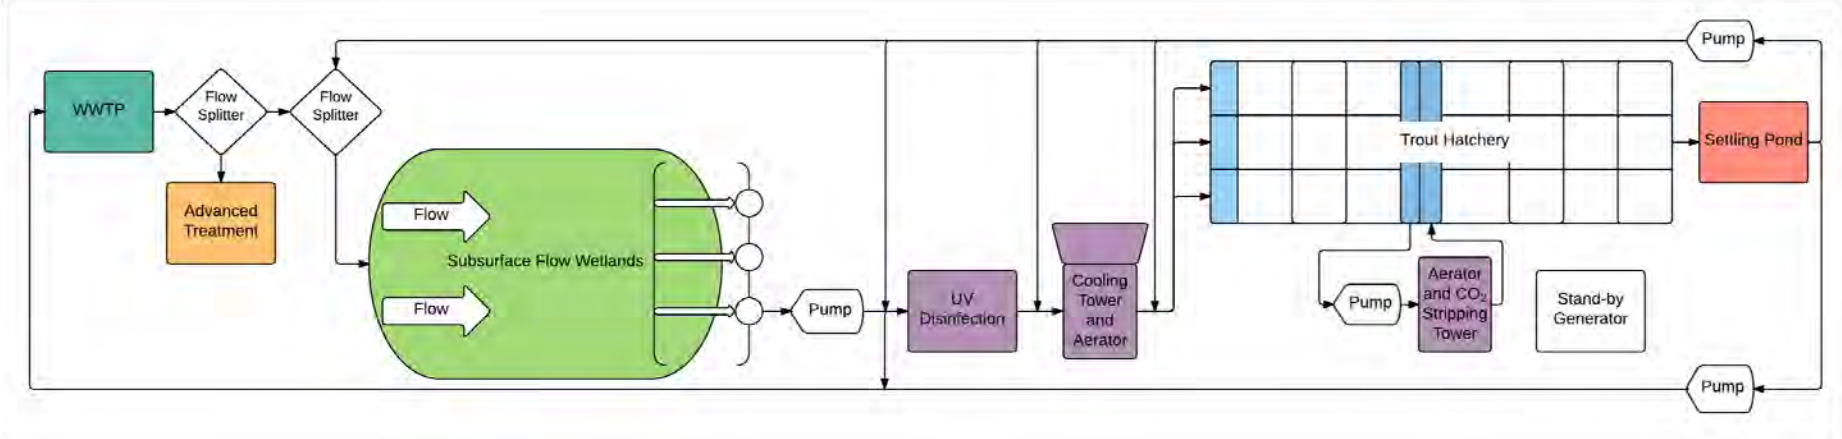

Figure 3. Conceptual Hatchery Process Diagram

Hatchery Calculations

The assumptions used in the conceptual design of the hatchery are summarized in Table 2.

Table 2. Big Bear Hatchery Characteristics

Characteristic	Value
Fish Size	10" long, 2.2 fish per lb
Weight of Fish per Year (lbs)	150,000
Hatchery Flows (gpm)	To be calculated
Hatchery Size	3 raceways, 10' wide, 800' long, 4' deep with 2' freeboard
Ponds per Raceway	8, in series

The calculations below summarize the method used to estimate the flow required to produce the desired 150,000 lb of fish. Equation 1 includes variable F, the Flow Index, "which takes flow rate into consideration when estimating maximum allowable weight of fish that a culture unit can hold," (Shelton 8). The flow is an important consideration because it "determines how rapidly fresh water will replace 'used' water (water in which fish have reduced dissolved oxygen concentrations and excreted waste products)," (Shelton 8). An F value of 0.75 was chosen because it is the middle of the range (0.5 to 1). This equation is empirical and assumes that the water is re-aerated after each pond.

Equation 1. Flow Required for a Trout Hatchery (Shelton 9)

$$Flow\ (gpm) = \frac{Weight\ (lbs\ fish)}{F * Length\ (in)}$$

$$Total\ flow = \frac{150{,}000\ lbs\ fish}{0.75 * 10\ in}$$

Total flow = 20,000 gpm total

Flow per raceway = 20,000 gpm/8 ponds/3 raceways

Flow per raceway = 833 gpm

Total flow required = 2,500 gpm

Conservative flow requirement = 3,000 gpm total

Compared to the Mojave and Fillmore hatcheries (which produce approximately twice as many fish with approximately twice this flow), a flow requirement of 3,000 gpm appears reasonable for the conceptual hatchery.

Wetlands Treatment Concept

Background

Constructed wetlands (CWs) can be used to treat effluent from a variety of processes including industrial wastewater, municipal wastewater, agricultural wastewater, landfill leachate, and stormwater runoff (Vymazal). For fish hatcheries specifically, major contaminants in fish farm effluent are fish food and fish waste (EPA Effluent Guidelines 7-2). CWs are a practical way to treat wastewater, as they require relatively low maintenance and have an approximate lifespan of 10-15 years before experiencing clogging (Cooper 24). Wetlands are great for Biological Oxygen Demand (BOD) reduction, but nitrification-denitrification (NDN) depends on the design of the wetland and pilot testing.

When it comes to types of CWs, there are both surface flow wetlands, where the water surface is above the filter/wetland media, and subsurface flow wetlands, where the water surface is below the media. Subsurface flow wetlands will be discussed here. This type of wetland performs better in cold climates, as the plant material and filter media insulate the subsurface flow (EPA Technology Assessment 2-1), and subsurface flow has a low total suspended solids (TSS) effluent which does not require filtration. There are two main types of subsurface constructed wetlands: horizontal flow (HF) and vertical flow (VF), which will be discussed in the next section.

Subsurface HF and VF CWs

The direction of fluid flow determines the category of CW. The flow in HF CWs flows in one side at the top, and out the other at the bottom as shown in Figure 4.

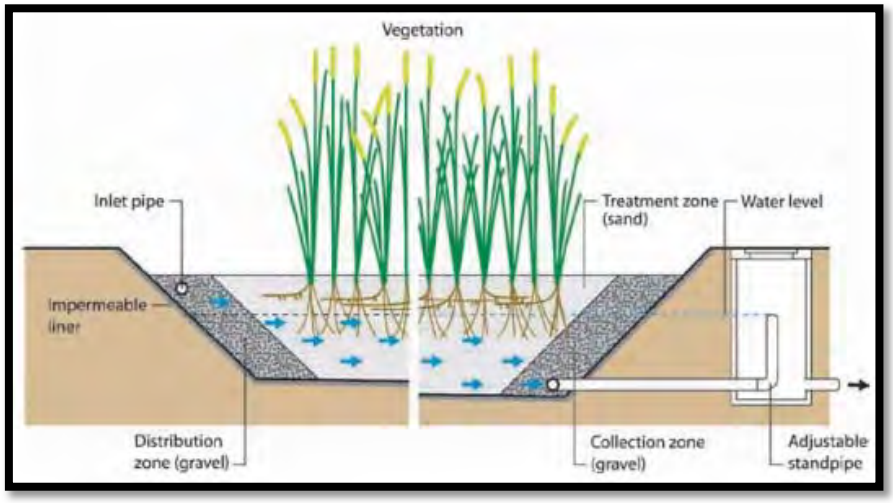

Figure 4. Horizontal Flow Wetland (Source: Greywater Management in Low and Middle-Income Countries)

The overall movement of fluid is horizontal. Because of this flow pattern, HF wetlands have very low oxygen concentrations, resulting in high denitrification ability (Vymazal 11). This is beneficial if the influent to the wetland has high concentrations of nitrates or nitrites. However, ammonia oxidation and removal occurs in an aerobic environment.

The flow to VF CWs enters along the top of the wetland media and exits along the bottom, as shown in Figure 5.

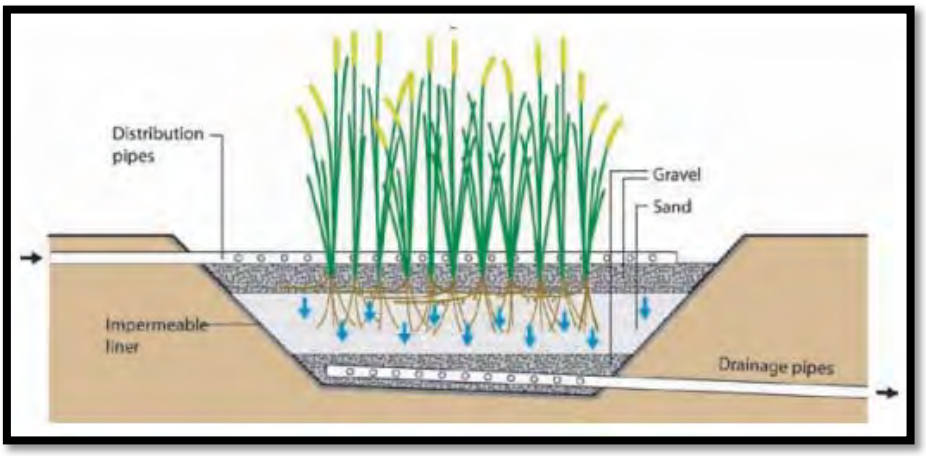

Figure 5. Vertical Flow Wetland (Source: Greywater Management in Low and Middle-Income Countries)

This flow pattern allows for a greater oxygen concentration in the subsurface wetland media, and results in high nitrification and ammonia removal ability (Vymazal 11). HF and VF CWs can be used in series to maximize the pollutant removal from the flow (Vymazal 11). "If the nitrification is achieved in a VF bed, then the nitrate can be removed by biological denitrification in an HF bed, which will be more oxygen stressed than the VF bed. Therefore, if the process design is done [skillfully], the advantages and disadvantages of the two types of beds can be used in a complementary fashion," (Cooper 18). Vymazal cites examples of both VF-HF series systems, and HF-VF series systems. Therefore, one of the main design considerations in wetland design is the properties of the constituents in the effluent from the fish hatchery. The pollutants targeted for removal will determine what types of flow need to be utilized.

Fish Hatchery Flow Constituents

The main pollutants targeted for treatment from agricultural flows are BOD_5, chemical oxygen demand (COD), TSS, Total nitrogen (TN), deionized ammonia (NH_4-N), and Total Phosphorous (TP) (Vymazal 7). Effluents from fish hatcheries differ from other types of runoff because they are very dilute, and contain a large amount of phosphorous (Vymazal 7). Phosphorous can cause eutrophication if introduced to receiving bodies of water, so the concentration of phosphorous after wetland treatment must be taken into consideration. Naylor, et al. presents a solution to the phosphorous issue: "…[T]he use of two sequential units is recommended, a first one consisting of a macrophyte planted basin using a neutral substrate to remove organic matter and N, followed by a second unplanted basin containing only a P-adsorbing substrate," (Naylor 215). This could be considered if phosphorus becomes an issue in hatchery effluent.

To provide context a general idea of the concentrations of pollutants in fish farm effluents, Table 3 summarizes 1998 data from three fish farms in Virginia presented in Chapter 7 of a report by the US EPA entitled "Effluent Guidelines: Aquatic Animal Production Industry: Economic and Environmental Analysis Document".

Table 3. Example Fish Farm Effluent Concentrations

Parameter	Farm 1 Effluent	Farm 2 Effluent	Farm 3 Effluent
Flow (MGD)	1.03-1.54	4.26-9.43	9.74-10.99
BOD_5 (mg/L)	0.96-1.9	0.6-2.4	0.5-1.8
DO (mg/L)	5.7-9.5	6.8-9.6	7.2-9.4
pH	7.3-7.8	6.9	7.8
Temperature (°C)	11-15.5	5-16.5	8.5-14
TSS (mg/L)	0.8-6	1.5-7.5	4.1-62
Settleable Solids (mg/L)	0-0.04	0.01-0.08	0.04-0.08
NH_3-N (mg/L)	0.5-0.6	0.45	0.02-0.17
Dissolved Organic Carbon (mg/L)	1.5-2.4	1.2-3.1	1.5-3.8

Governing Equations and Design Considerations

The Technology Assessment(Assessment) conducted by the Environmental Protection Agency in July 1993 describes certain equations that can be used to estimate size for CW design purposes. Darcy's Law has been used in practice to calculate either the flow rate into the CW or the cross-sectional area perpendicular to the flow:

Equation 2. Darcy's Law (EPA Technology Assessment 4-3)

$$Q = k_s A S \qquad (2)$$

Where:

- Q = flow per unit time, m^3/d (ft^3/d), or (gal/d), etc.
- k_s = hydraulic conductivity of a unit area of the medium perpendicular to the flow direction, $m^3/m^2/d$ ($ft^3/ft^2/d$), or (gal/d), etc.
- A = total cross-sectional area, perpendicular to flow, m^2 (ft^2).
- S = hydraulic gradient of the water surface in the flow system dh/dL, m/m, (ft/ft).
  (All units must be consistent)

The Assessment provides the following analysis of using Darcy's Law to approximate flow or shape: "Darcy's Law is not strictly applicable to subsurface flow wetlands because of physical limitations in the actual system. It assumes laminar flow conditions, which may not be the case when large rock or very coarse gravel are used as the media. Turbulent flow will occur in these coarse media when the hydraulic design is based on a high hydraulic gradient. Darcy's Law also assumes that the flow (Q) in the system is constant and uniform, but in the actual case in a SF wetland the input versus output Q may vary due to precipitation, evaporation, and seepage; and short circuiting of flow may occur due to unequal porosity or poor construction. **[All] of these factors limit the theoretical applicability of Darcy's Law, but it remains as the only reasonably accessible model for design of these SF systems**," (EPA Technology Assessment 4-3).

To determine BOD_5 removal, the model of a first order plug flow reactor has been used, given be Equation 3.

Equation 3. First-order Plug Flow Model (EPA Technology Assessment 3-7)

$$\frac{C_e}{C_o} = e^{(-K_T t)}$$

(4)

Where:
C_e = Effluent BOD_5 (mg/L)
C_o = Influent BOD_5 (mg/L)
K_T = temperature dependent rate constant (d^{-1})
t = hydraulic residence time (d)
$K_T = K_{20}(1.06)^{(T-20)}$
K_{20} = rate constant at 20o C, (d^{-1})
= 1.104 d^{-1}
T = temperature of liquid in the system (°C)

The surface area (length * width) can be calculated using Equation 4.

Equation 4. Surface Area to Achieve Needed BOD_5 Removal (EPA Technology Assessment 4-12)

$$A_s = (L)(W) = \frac{Q[\ln(C_o/C_e)]}{K_T dn}$$

Where:
A_s = bed surface area, m^2 (ft^2)
Other terms defined previously

For an in-depth discussion of aspect ratio, bed slope, media types, vegetation selection, and inlet and outlet structures, see the EPA's Technology Assessment.

The design process for BOD_5 removal given by the EPA is as follows:

1. Determine the media type, vegetation, and depth of bed to be used.
2. Determine by field or laboratory testing the porosity (n) and "effective" hydraulic conductivity (k_s) of the media to be used.
3. Determine the required surface area of the bed, for the desired level of BOD_5 removal [with equation 4]
4. Depending on site topography, select a preliminary aspect ratio (L:W); 0.4:1 up to 3: 1 are generally acceptable.
5. Determine bed length (L) and width (W) from the previously assumed aspect ratio, and results of step 2.
6. Using Darcy's Law [equation 2] with the previously recommended limits (k_s < 1/3 "effective" value, hydraulic gradient S < 10% of maximum potential), determine the flow (Q) which can pass through the

bed in a subsurface mode. If this Q is less than the actual design flow, then surface flow is possible. In that case it is necessary to adjust the L and W values until the Darcy's Q is equal to the design flow.

7. It is not valid to use [equation 2] with effluent BOD_5 (C_e) values below 5 mg/l. As previously discussed, these wetland systems export a BOD_5 residual due to decomposition of the natural organic detritus in the system.
8. In cold climates it is necessary to assume a design temperature for BOD_5 to first determine the required surface area. Thermal calculations are then necessary to determine the winter heat losses and bed temperature conditions during the design HRT. Further iterations of this procedure are necessary until the assumed temperature and the temperature determined by the heat loss calculations converge. (EPA Technology Assessment 4-13)

For a more detailed discussion of the caveats of using the above design steps, see the EPA's Technology Assessment by Sherwood C. Reed, cited in Works Cited.

Sample Calculation

Below is a sample design calculation for a subsurface flow constructed wetland. Table 4 lists the values used in the sample calculation.

Table 4. Values Used in Sample Calculation

Characteristic	Value	Source
Flow Rate, Q (gpm; MGD)	1,000; 1.44	Assumed
Media Type	Medium gravel	Chosen from EPA Table 5 (4-6)
Porosity, n (%)	40	Table 5
Effective Hydraulic Conductivity, k_s (m^3/m^2d)	10,000	Table 5
Vegetation Type	Reeds, *Phragmites*	Chosen from EPA Table 6 (4-12)
Root Depth (m)	0.6	Table 6
Bed Depth (ft)	3.0	Estimated
Aspect Ratio, L:W	0.4:1	Estimated
Water Surface Hydraulic Gradient, S (ft/ft)	0.01	Estimated
BOD_5 of Influent, C_o (mg/L)	10	Estimated
BOD_5 of Effluent, C_e (mg/L)	5	Estimated
Average Depth of Liquid in Bed, d (ft)	2.5	Estimated
Temperature of Fluid in System, T (°C)	10	Estimated
Rate Constant at 20°C, K_{20} (d^{-1})	1.104	EPA Tech Assessment (4-11)

a. Calculate K_T value, rate constant at temperature T:

$$K_T = K_{20}*(1.06)^{(T-20)}$$

$$K_T = (1.104)*(1.06)^{(10-20)}$$

$$K_T = 0.616\ d^{-1}$$

b. Calculate the bed surface area, A_s:

$$A_s = L*W = (Q*[\ln(C_o/C_e)]) / (K_T*d*n)$$

A_s = 216,444.84 ft^2 for a 50% BOD_5 reduction ≈ 5.0 acres

c. Calculate L and W using A_s and chosen aspect ratio:

L:W = 0.4:1 (from Table 2)

$0.4x^2 = A_s$

x = 735.60 ft

d. Check theoretical flow, Q_o against assumed flow, Q using Darcy's Equation:

$Q_o = (1/3)*k_s*A*S$ with $A = W*d$

Q_o = 1044.76 gpm

Check: $Q_o > Q$, flow will be below the surface

Note: if an S value of 0.001 is used, then Q_o = 104.48 gpm, which makes $Q_o < Q$, and surface flow is very likely to occur. Adjust inputs, such as d, S, and L:W to ensure that $Q_o > Q$ in the final design.

e. Calculate the hydraulic residence time factor, t, from plug flow model:

$t = (n*L*W*d) / Q$

$t = (0.4*A_s*2.5) / Q$

t = 1.12 days

f. Final wetland dimensions:

A_s = 216,444.84 ft^2 ≈ 5.0 acres

L = 294.24 ft

W = 735.60 ft

Conceptual Wetland Sizing for Big Bear Hatchery

The flow rate required through the wetland will depend on the recirculation rate to the hatchery and amount of makeup water used. For this analysis, it was assumed that 50% of the 3,000 gpm flow would be recirculated in the hatchery, requiring 1,500 gpm from the wetlands. Table 5 shows the values used to estimate the size for treatment wetlands.

Table 5. Values Used in Big Bear Calculation

Characteristic	Value
Flow Rate, Q (gpm)	1,500
Bed Depth (ft)	3.0
Aspect Ratio, L:W	0.52:1
BOD_5 of Influent, C_o (mg/L)	15
BOD_5 of Effluent, C_e (mg/L)	5
Average Depth of Liquid in Bed, d (ft)	2.5
Temperature of Fluid in System, T (°F)	50

A first order plug flow reactor model with maintenance of subsurface flow using Darcy's Law was used to estimate wetland size. Based on an assumed 3 day hydraulic retention time (HRT) for full NDN, 18 to 24 acres of land would be required for this wetland, as shown in Figure 6. Note that this wetland could require flood protection.

Figure 6. Conceptual Wetland Size

Potential Refinements

Alternative Treatment Options

In addition to a wetlands treatment concept, an alternative treatment option was identified.

A package wastewater treatment plant could be installed instead of a wetlands treatment system. This would include the following:

1. Headworks
    a. 1,500 gpm fine screen (50 micron or less)
    b. pH correction/nutrient addition if required
    c. Flow meter and flow control box
2. Treatment
    a. 3 trickling filter trains each capable of receiving 500 gpm
    b. Each train will have a recirculation pump, distribution header, air supply system etc.
3. Effluent Screening
    a. Final effluent will be screened prior to disposal to a polishing pond and back to the hatchery

Community Benefits

In addition to the recreational benefits that a local hatchery would provide, the following list provides a few ideas for additional elements could be incorporated to provide added community benefits:

- university research opportunities
- interactive community component that provides public tours and education for the hatchery
- interactive community component that provides public tours and education for the wetlands treatment system

Opinion of Preliminary Cost

A concept level opinion of preliminary cost was developed to provide an order of magnitude estimate for the hatchery and wetlands treatment concept to help guide decisions on next steps for this project component.

It is estimated the hatchery would cost between $8.3M and $13.2M, and the wetlands would cost between $8.0M and $11.3M, not including the cost of the plants. This gives a total of between $16.3M and $24.5M. An alternative mechanical treatment plant could cost between $6.2M and $7.5M. These costs include implementation and contingency allowance and conservative and intended for an order of magnitude analysis. Annual operating costs could be between $400,000 and $700,000, based on FTE per CDFW hatcheries and CDFW hatchery budgets.

Using an annualized cost method and assuming the capital costs are financed with a 30-year loan at 2.2% (to be consistent with the financial assumptions for the other components in the Recycled Water Facilities Planning Study), the unit cost of the fish produced would be in the range of $8 to $12 per pound.

Next Steps

The key assumptions, unknowns, and potential next steps are outlined below.

Key Assumptions and Unknowns

- A pilot study is required to understand nitrogen removal and water quality
- Evapotranspiration has not been accounted for in either the raceways or in the wetlands
    - Makeup water is available from the BBARWA WWTP
- Increased solids handling from cleaning of hatchery raceways could impact the WWTP
- Unionized ammonia ratio needs more research
    - Impacted by alkalinity, pH, temperature of water, and actual gravel source
- A pilot study is needed to assess the ability of a subsurface wetland to consistently reduce ammonia below 1 mg/L
- HRT of ~3 days to meet ammonia target
    - A reduction in HRT would reduce wetland size

Potential Next Steps

- Visits to Mojave River Hatchery
- Prepare bio-programming and hatchery feasibility study by hatchery expert
- Study feasibility of wetlands treatment for hatchery recirculation
- Investigate regulatory considerations
    - EPA, USDA, CDFW, RWQCB, etc.
- Pilot study with small-scale wetland and hatchery

SUBJECT: **COST ESTIMATE FOR BBARWA TANK COST**

Big Bear Lake Department of Water and Power (BBLDWP) asked Water Systems Consulting, Inc (WSC) to prepare a comparative cost opinion for construction of a 500,000 gallon modular precast concrete tank supplied by the U.S. Army Corps of Engineers (COE) and a custom cast-in place concrete tank. The COE has offered a 100' x 50' x 20' precast concrete tank (nominally 500,000 gallons storage) for use by BBLDWP/ Big Bear Area Regional Wastewater Agency (BBARWA). The tank panels are currently stored at the manufacturer's yard (Structure Cast) in Bakersfield. The precast tank will be stored at BBARWA's site until it is installed. WSC also prepared a cost opinion for a more traditional cast-in-place concrete tank in order to compare the relative value of accepting the modular precast tank from COE.

Precast Concrete Tank

The precast concrete tank has been designed and fabricated by Structure Cast to the COE project specifications. The modular tank is composed of 80 precast concrete panels as follows:

1. Thirty (30) 10' x 20' exterior wall panels
2. Twelve (12) 8.5' x 20' interior wall panels
3. Thirty-eight (38) roof panels with variable dimensions

The tank will be partially buried up to a depth of 10' and will be fabricated on a cast-in-place concrete slab foundation. Fabrication requires placing the wall panels onto rebar dowels cast into the foundation followed by installation of 1" diameter steel horizontal tie-rods which are post tensioned to pull the panels together. The tank is waterproofed with a combination of joint mastic, grout, and waterproof caulking at locations where the panels join each other or the foundation. The roof panels are set on rebar cast into the wall panels, protruding approximately 30" from the end of the wall panel which aligns with sleeves cast into the roof panels.

Work involved includes the following items:

1. Delivery and storage of the panels until ready for use
2. Design and construction of a concrete slab foundation
3. Excavation and backfill of the tank
4. Fabrication and testing of the tank

The comparative cost does not include site piping, level sensing, valves, hatches, ladders, or other work that would be comparable between the two tank options and will depend on the final selected use and layout of the tank and project site.

Precast Concrete Tank	
Work Item	**Cost ($)**
Delivery from Bakersfield to BVWSP[1]	197,000
Delivery Credit from COE[1]	(197,000)
Storage materials	5,000
Installation	
Construct concrete foundation	175,000
Excavation & backfill for half buried tank[2]	110,000
Fabricate and test tank	220,000
Subtotal	**510,000**
Confirm structural design of tank for new location[3]	5,000
Design foundation - structural and geotechnical engineering	24,000
Construction management	25,000
Subtotal	**564,000**
20% Contingency	**113,000**
Comparative Project Total	**677,000**

[1]WSC understands that the COE will over the cost of delivery to Big Bear Lake assuming the actual delivered cost is less than the budgeted delivery line item in the Fort Irwin Hospital project bid of $535,000.
[2]Excavation & backfill of completely buried tank is estimated at an additional $70,000.
[3]Structural evaluation of tank should be completed prior to accepting delivery of the tank.

Cast-in-place Concrete Tank

As a point of comparison, BBLDWP requested a cost opinion for an equivalent cast-in-place concrete tank. The cast-in-place tank would have similar dimensions to the precast tank (100' x 50' x20'). The cast-in-place concrete tank is anticipated to be a traditional steel reinforced concrete tank, comprised of a poured reinforced concrete foundation slab with reinforced walls formed and poured in place on the foundation. This option will require complete design engineering, and will be delivered by the traditional design-bid-build contract method.

Cast-in Place Concrete Tank	
Work Item	**Cost ($)**
Construct concrete foundation	175,000
Excavation and backfill for half buried tank	110,000
Cast-in-place walls	310,000
Pre-fabricated roof system	125,000
Subtotal	**710,000**
Design (includes structural, geotechnical and civil engineering)	80,000
Construction management, materials testing, office engineering	85,000
Subtotal	**875,000**
20% Contingency	175,000
Comparative Project Total	**1,050,000**

Comparison

Comparing the two project totals the precast tank is less expensive to implement with a potential savings to BBLDWP in excess of $300,000. However, this cost savings has some potential risk associated with it. The risk should be considered to increase the effective cost of the precast tank. Here are a few of the areas of concern with the precast tank:

1. The precast concrete panels have exposed steel rebar and cast sleeves that could be subject to corrosion when stored for an extended period outdoors. The corrosion, if not inhibited, could decrease the useful life of the tank. Mitigation could include coating the rebar prior to storing, and/or cleaning rust from steel prior to fabrication.
2. The tank requires long steel rods to tension the panels together, which requires alignment of the sleeves in the panels. There is +/- 1" of tolerance on the alignment of the sleeves. However, if the tank sits for an extended period it may be costly to correct any misalignment inherent in the panels. There may not be a contractual/binding obligation back to StructureCast in the future.
3. The tank design requires extensive water sealing of tank panel joints. The joints could be a potential source of leaks. If the tank doesn't pass testing for leaks and water tightness it could result in a protracted fight with the fabricator regarding the source of the leaks/defects (i.e. contractor, manufacturer, or storage defects).
4. Panels, sleeves, or rebar could be damaged during storage leading to installation/tank fabrication issues. This could require re-casting panels.
5. The design of the panels may restrict coring openings for new pipe penetrations in the interior and exterior panels to accommodate the required pipe connections and to create openings between the three storage bays. If adequate openings cannot be cored, new panels would need to be cast.

SUBJECT: RESPONSES TO QUESTIONS ON THE DRAFT BEAR VALLEY WATER SUSTAINABILITY PROJECT REPORT

Dear Steve,

This letter presents a summary of questions and comments received from the BBARWA Board of Directors following their review of the Draft Bear Valley Water Sustainability Project Report (Report), along with responses.

1. *Can secondary effluent and/or tertiary water be utilized for snowmaking at the local resort?*

   Yes, the State Water Resources Control Board (State Water Board) permits the use of disinfected tertiary recycled water for artificial snowmaking purposes. In late 2015, Donner Summit Public Utilities District partnered with Soda Springs Mountain Resort to become the first ski area in California to make snow using recycled water.

   This beneficial use alternative was considered as a potential refinement to Alternative 3, as described in Section 5.1.3.6 of report. Key challenges to implementation of this beneficial use in Big Bear include potential negative public perception, the cost of the recycled water, and the additional operational considerations for the Bear Mountain Resorts; therefore, it was concluded that the use of recycled water for artificial snowmaking in Big Bear is not a highly favorable opportunity. Despite these challenges, if the Big Bear Valley agencies would like to further evaluate this opportunity, the next step would be to meet with the resort owners to discuss the potential project and gauge their interest in using recycled water for snowmaking.

   Potential public perception issues can be evaluated with public surveys and addressed through focused community outreach. The cost of delivering recycled water for snowmaking could be reduced if the existing pipeline running from Lake Pump Station to Big Bear Mountain Resorts, which is currently used to deliver water for firefighting and snowmaking, was used to distribute the recycled water. Regulatory and operational considerations for shared use of the pipeline would need to be evaluated. Also, the amount of water used for snow making is minimal and seasonal, which adds to this not being a viable option.

2. *Can we "over" irrigate a crop within the Valley and utilize the incidental percolation concept to achieve recharge?*

   No, the State Water Board strictly regulates irrigation sites that use recycled water and requires that recycled water application is limited to rates required to grow the crop to minimize the potential for runoff, ponding, and incidental percolation. Regional Boards are becoming more active in enforcing this restriction. BBARWA's Waste Discharge Requirements (WDR) permit for the Lucerne Valley

irrigation site was recently updated by the Colorado River Regional Board to require an Irrigation Management Plan that includes a water balance and nutrient balance to assure that recycled water is applied at appropriate rates.

3. *What is the feasibility of using reclaimed water for release to Bear Creek?*

Bear Creek is designated as a Municipal and Domestic Water Supply in the Santa Ana River Basin Plan (Basin Plan); therefore, discharge to Bear Creek may be regulated as a potable reuse project, which would require advanced treatment. Discharge to Bear Creek under a potable reuse scheme would require an analysis to demonstrate that there would be sufficient environmental buffer before downstream water purveyors divert the water to their surface water treatment facilities. The potential negative public perceptions from the downstream users would be a key challenge to this scenario. If the Department of Drinking Water determined that the discharge to Bear Creek was not a potable reuse project, it may be possible to discharge tertiary treated recycled water to Bear Creek. However, the Basin Plan Water Quality Objective for total dissolved solids (TDS) for Bear Creek is 175 mg/L, so the recycled water would require treatment with reverse osmosis (RO) to reduce salts, increasing the cost of producing the recycled water. The pipeline from the BBARWA WWTP to Bear Creek would be approximately 12.5 miles in length and cost approximately $20 million to construct.

State Water Board Order No. 95-4 mandates a minimum flow to be released from the lake to maintain a minimum average daily flow of 1.0 cfs in Bear Creek to provide fishery protection. Potential effects to the fish and their habitat would need to be evaluated to ensure the recycled water release to Bear Creek would not result in habitat degradation.

Although this option may provide an alternative to releases from the lake, it does not provide a water supply benefit to the Big Bear Valley.

4. *What is the feasibility of implementing a small reclamation effort to get our foot in the door while planning for future expansion?*

One potential option for implementing a small reclamation effort to initiate the Bear Valley Water Sustainability Project is to construct a small-scale advanced treatment unit at the BBARWA WWTP and recharge the purified water at the Greenspot recharge site. Prior reports have demonstrated that permitting and constructing the Greenspot site for groundwater recharge is feasible. A skid-mounted advanced treatment facility could be installed at BBARWA's WWTP and tanker trucks can haul a small portion of recycled water to a demonstration recharge basin at the Greenspot site. Deferring the construction of the pipeline to the Greenspot site would reduce the initial capital investment by approximately $5 million.

Although the unit cost of small scale projects is high due to economies of scale, a small demonstration project provides opportunities for community education, proof of concept and local buy-in of the project. The small-scale project would allow the Big Bear Agencies to minimize risk of implementing a large recycled water program and reduce the initial capital expenditure necessary to initiate the program. WSC can perform a cost analysis of this alternative and include the results and a general description of the project in the Final Draft of the Report.

To make a small reclamation effort more financially feasible for the Big Bear Valley, BBARWA can pursue low interest loans or grants to help fund a recycled water program. It is common for funding agencies to solicit applications for small recycled water demonstration projects that provide habitat enhancement, social benefits, water supply benefits or educational opportunities. For example, the United States Bureau of Reclamation (USBR) recently began a Drought Response Program to fund Contingency Planning and Drought Resiliency Projects aimed at building long-term resiliency to drought. The conditions of the Drought Response Program closely align with the objective of the Bear Valley Water Sustainability Project; therefore, if the USBR Drought Response Program receives federal funding allocations for the next fiscal year, the program can be evaluated in early 2017 as a potential funding source.

5. *What is the feasibility of establishing a coalition consisting of Federal, State, County, City, CSD, DWP, MWD, BBARWA and the MWA to fund a reclamation effort?*

BBARWA, DWP, CSD and MWD have demonstrated their commitment to working together toward common benefits by partnering to develop this Report as a first step. There is an opportunity for elected representatives of these agencies to foster relationships with other elected officials to develop further support and collaborative teaming agreements to further advance a reclamation effort in the Big Bear Valley. Each agency would likely need to gain a clear understanding of the short and long term benefits to their citizens to justify a shared funding effort.

Competitive Federal and State funding programs solicit grant and low-interest loan funding for recycled water projects, and sometimes provide opportunities to combine both Federal and State funding sources to further benefit the community.

6. *The capital cost of a Brine Management System is $9,742,000 and the O&M cost is $1,018,000 or about 40% of the total annual O&M? Please provide additional details regarding components of this cost.*

The brine management system component of this Report was developed based on the findings from the CH2M and BBARWA report, *Evaluating Traditional and Innovative Concentrate Treatment and Disposal Methods for Water Recycling at Big Bear Valley, California*, completed in 2007. This study evaluated seven alternative technologies based on detailed site-specific considerations and pilot testing of some equipment. The study identified the most favorable alternative as a system consisting of a vibratory shear enhanced process (VSEP) to reduce brine volume, a blending system, a small pipeline inside the existing Lucerne Valley discharge pipeline, and new evaporation ponds in the Lucerne Valley. The 2007 study provided only total capital and O&M costs and did not provide a breakdown of costs by component. These total values were escalated to 2015 costs and scaled to match the flows used in the Report.

Due to the significant cost of brine management, one of the recommended next steps in development of a Bear Valley Water Sustainability Project is to target optimization of brine management at the existing BBARWA WWTP by evaluating:

- new and emerging technologies since the 2007 study that could reduce brine disposal costs
- local brine evaporation scenarios and sites
- alternative treatment technologies for a portion of the advanced treatment to minimize brine produced

7. *Is the useful life of equipment in this Report assumed to be 20 years? Except for pipelines, is that reasonable?*

   The useful life of equipment assumed for this Report was 20 years, except pipelines, which are designed for a useful life of 60 years or more. A useful life of 20 years for the equipment is a conservative assumption. BBARWA staff has practiced an aggressive preventive maintenance schedule to maximize the useful life of the equipment and mitigate equipment failures. For example, the bar screens at the wastewater treatment plant were installed in 1974 with an expected useful life of 15 years, but preventative maintenance activities enabled the bar screens to operate until 1993 before a major overhaul was performed. The bar screens are still in operation and have far exceeded their expected useful life of 15 years due to BBARWA's preventative maintenance practices.

8. *Is it possible to arrange a tour of Orange County's Groundwater Replenishment System?*

   Yes, the Orange County Water District frequently offers tours of their facility. WSC would be glad to coordinate with Orange County Water District to schedule a tour for the agencies that participated in this study.

9. *What is the possibility of using Big Bear Lake water to help with the 20-80% blend for groundwater recharge dilution credits?*

   The Groundwater Recharge Regulations require the diluent water source to meet drinking water standards for primary and secondary Maximum Contaminant Levels (MCLs) and notification levels. As a surface water, the existing lake water quality would not meet these drinking water standards and would require additional treatment through a surface water treatment plant.

10. *Is it correct that tertiary treated water cannot be used to augment the water supply in Big Bear Lake?*

    Disinfected tertiary recycled water could potentially be used to augment the lake levels in Big Bear Lake; however, there are currently restrictions in place that prohibit that practice. Currently, BBARWA operates under a Waste Discharge Requirement (WDR), which does not permit discharge to waters of the United States (i.e., Big Bear Lake). To enable this practice, the WDR would need to be changed to a National Pollutant Discharge Elimination System (NPDES) permit which would impose stricter discharge limits on the wastewater treatment plant effluent stream. Additionally, MWD has a resolution in place that prohibits discharge of recycled water to Big Bear Lake. This resolution would need to be rescinded by MWD to enable this practice.

    Based on discussions with regulatory agencies, using disinfected tertiary recycled water to augment the lake levels is possible, provided the necessary permits and resolutions are changed and sufficient technical analysis is performed. The analysis would have to demonstrate that the introduction of recycled water to Big Bear Lake would not degrade the water quality of the lake. The Basin Plan Water Quality Objectives for Big Bear Lake are very low for nitrogen, phosphorus, and TDS. In addition to tertiary treatment upgrades, RO treatment would need to be added to reduce the salt in the recycled water to meet the lake TDS objective of 175 mg/l.

Public perception could be a significant barrier to implementation of this practice and would need to be addresses through a community outreach program.

11. *Would a lower cost alternative be to put RO treated recycled water into Big Bear Lake?*

Yes, an alternative that delivers RO treated recycled water to the lake would have a lower cost than those presented in the report due to a lower level of treatment and a shorter pipeline. This option was not evaluated in the report because it was not found to provide a water supply benefit to the Big Bear Valley, which is a key objective of the report. Without a water supply benefit, opportunities for grants and low-interest loans would be very limited and would place more of the financial responsibility on the local community.

However, based on discussions with regulators, this is expected to be a feasible option to augment lake levels. One risk to this use of recycled water is that it may create a long term water dependency and make it difficult to change the discharge point in the future, due to political and/or environmental challenges. For example, if a water supply benefit becomes more critical and the agencies decide to transition to groundwater recharge, there could be opposition to removing the water from the lake by the community or environmental groups if the water has supported habitat in the Stanfield Marsh.

12. *Is it feasible to provide RO treated recycled water to discharge to Stanfield Marsh or Baldwin Lake?*

Prior studies of groundwater recharge potential in the Big Bear Valley have not identified Stanfield Marsh or Baldwin Lake as viable locations for groundwater recharge. In previous reports, it was concluded that Stanfield Marsh would not be conducive to percolation due to an underlying clay layer and would not provide a water supply benefit. Additionally, since the Stanfield Marsh is hydraulically connected to the Lake, the TDS objective for Stanfield Marsh would be the same as the Lake, which is 175 mg/L. Treating to this TDS level would require a significant portion of the discharge to receive RO treatment to reduce TDS.

13. *What is the feasibility of developing an initial project to include tertiary treated recycled water for irrigation and construction purposes?*

The report evaluated numerous pipe segments and customer groups for providing recycled water for irrigation and construction. Of these, Segment 1.1, which provides irrigation water for schools and parks in Sugarloaf, is the lowest cost segment. The total capital cost would be $3.3 million to serve approximately 54 AFY of recycled water. This system is a standalone system due to the higher elevation in Sugarloaf so it can be implemented independent of all other options. As a result, it would not be expandable in the future to serve additional customer or integrate with a groundwater recharge project. Although the initial capital investment for this segment would be lower, the unit cost is nearly $4,000/AF and it does not build a foundation that can be expanded upon for future reuse projects.

14. *The Report should address "gray water." I believe the County actually has a gray water ordinance, but I do not think many are aware of it.*

The Report will be edited to address gray water in Section 6.4, Water Conservation / Reduction Analysis. Implementation of private gray water systems would decrease wastewater generation, as

well as water consumption. While gray water systems provide an opportunity to increase the sustainable use of resources, widespread implementation in the Big Bear Valley would have an impact on the volume and strength of wastewater available for future reuse projects.

15. *Comment on digging deeper into Point of Use (POU) conservation measures other than the easy ones (toilets and low flow fixtures).*

    Section 6.4 of the Report, which discussed Water Conservation / Reduction Analysis will be edited to include an expanded discussion of current and proposed conservation measures being implemented by the DWP and CSD. Additional water conservation would have an impact on the volume and strength of wastewater available for future reuse projects.

16. *Look at what other arid communities/countries (Israel) do.*

    The development of water reuse in the United States has been greatly influenced by the research, experiences and treatment technologies employed in arid countries who have been pioneers in water reuse, including Israel, Singapore, and Australia. In the United States, the WateReuse Association has partnered with agencies in Singapore and Australia to share expertise and knowledge to benefit the research community and the water industry as a whole. Through conferences, research projects, and toolsets, the WateReuse Association provides its members with the newest ideas, information, and tools for evaluating and implementing water reuse projects. As an active member of the WateReuse Association, WSC regularly utilizes these state-of-the-industry resources and leveraged this information as appropriate in the development and evaluation of water reuse alternatives in the Big Bear Valley.

Please don't hesitate to reach out with any additional questions or if clarification is required for any responses contained in this letter.

Sincerely,

Water Systems Consulting, Inc.

EXECUTIVE SUMMARY

Urban Crossroads, Inc. has prepared this construction noise study to determine the potential noise impacts due to the proposed Replenish Big Bear development ("Project"). The Project site is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake are located in the middle of this Basin. The overall Project area consists of the Valley, in the County of San Bernardino. The Project is not noise sensitive and would not be impacted by aircraft noise. Therefore, the focus of this analysis is on the potential construction related noise and vibration impacts. This noise study has been prepared to satisfy applicable County of San Bernardino construction noise standards and significance criteria based on Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (1)

SUMMARY OF SIGNIFICANCE FINDINGS

The results of this Replenish Big Bear Noise Impact Analysis are summarized below based on the significance criteria in Section 4 of this report. Table ES-1 shows the findings of significance for each potential noise and/or vibration impact with applicable Project standard practices described in this study.

TABLE ES-1: SUMMARY OF SIGNIFICANCE FINDINGS

Analysis	Report Section	Significance Findings	
		Unmitigated	Mitigated
Off-Site Traffic Noise	6	*Less Than Significant*	-
Operational Noise	7	*Less Than Significant*	-
Construction Noise	8	*Significant*	*Less Than Significant*
Construction Vibration		*Less Than Significant*	-

1 INTRODUCTION

This noise analysis has been completed to determine the construction noise impacts associated with the development of the proposed Replenish Big Bear ("Project"). This noise study briefly describes the proposed Project, provides information regarding noise fundamentals, sets out the local regulatory setting, presents the study methods and procedures for short-term construction noise and vibration impacts.

1.1 SITE LOCATION

The Project site is located within the Big Bear Valley Groundwater Management Zone (GMZ or Basin). Big Bear Lake and Baldwin Lake are located in the middle of this Basin. The overall Project area consists of the Valley, in the County of San Bernardino as shown on Exhibit 1-A.

1.2 PROJECT DESCRIPTION

The proposed Project includes upgrades and additions to Big Bear Area Regional Wastewater Agency's (BBARWA) wastewater treatment plant (WWTP) to produce purified water through full advanced treatment to protect the receiving waters and their beneficial uses. The Replenish Big Bear Program would upgrade BBARWA's WWTP to produce full advanced treated water that would be retained within the Big Bear Valley watershed to be used to increase the sustainability of local water supplies, consequently, wastewater currently delivered to Lucerne Valley will be modified. The proposed Project consists of construction and operation of the various facilities which are separated into five project categories: 1) Replenish Big Bear Component 1: Lake Discharge Pipeline Alignment; 2) Replenish Big Bear Component 2: Shay Pond; 3) Replenish Big Bear Component 3: Evaporation Pond; 4) Replenish Big Bear Component 4: BBARWA WWTP Upgrades; and 5) Replenish Big Bear Component 5: Sand Canyon.

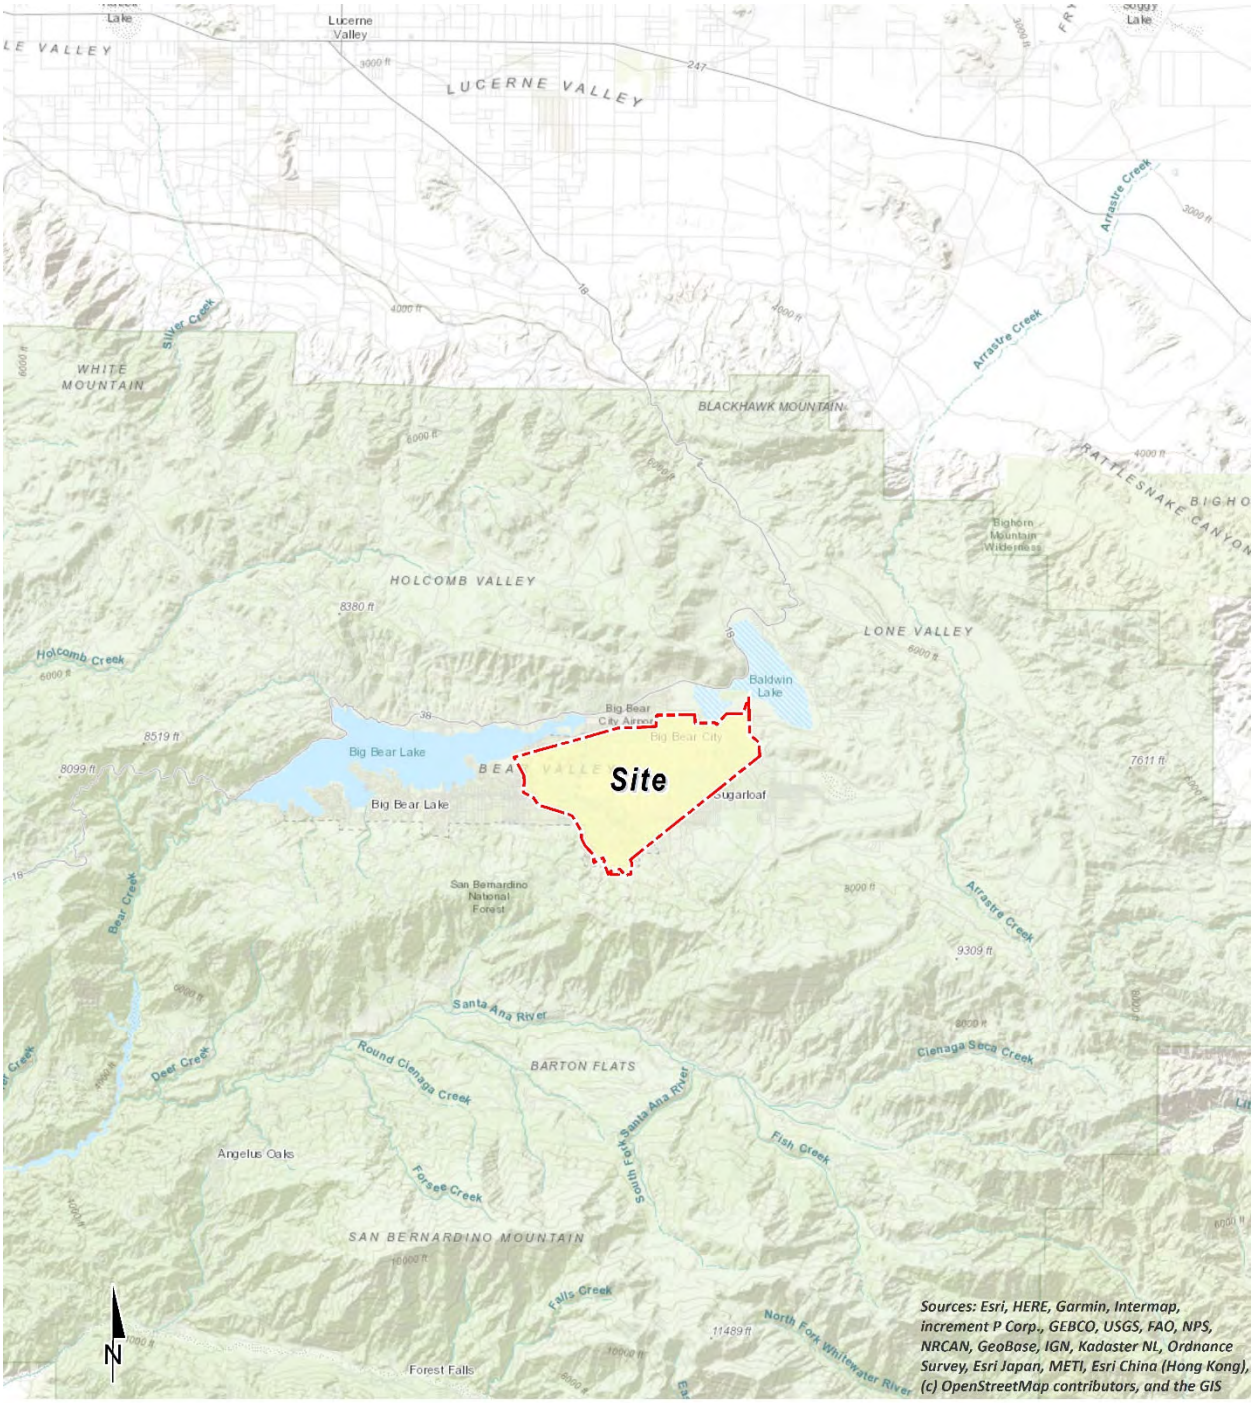
REPLENISH BIG BEAR COMPONENT 1: BBARWA WWTP UPGRADES

This Replenish Big Bear Component includes upgrades to the BBARWA WWTP, to include 2.2 MGD of full advanced treatment, producing up to 2,210 AFY of purified water. The upgrades include the construction of a 40,000 SF building which would provide the following upgrades and new construction in order of process flow:

- Upgrades to the Oxidation Ditches
- New Denitrification Filter
- New UF and RO filtration membranes
- New UV Disinfection
- New AOP
- New Pellet Reactor: 0.22 MGD

The BBARWA WWTP Treatment Upgrades also includes the installation of about 1,350 LF of brine pipeline anticipated to be sized between 8" to 10" from the pellet reactor to the solar evaporation ponds. Additionally, the BBARWA WWTP Treatment Upgrades also includes installation of a 50 gpm brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump purified water to Shay Pond and Stanfield Marsh.

EXHIBIT 1-A: LOCATION MAP



REPLENISH BIG BEAR COMPONENT 2: LAKE DISCHARGE PIPELINE ALIGNMENT

The Replenish Big Bear Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter.

REPLENISH BIG BEAR COMPONENT 3: SHAY POND

The Replenish Big Bear Program would ultimately install about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

REPLENISH BIG BEAR COMPONENT 4: EVAPORATION POND

The Replenish Big Bear Program would include between 23 and 57 acres of evaporation ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to 2 monitoring wells..

REPLENISH BIG BEAR COMPONENT 5: SAND CANYON

The Sand Canyon groundwater recharge project involves extracting Project water stored in the Lake to a temporary storage pond using existing infrastructure owned by a local resort. The Project water will then be pumped and conveyed to the Sand Canyon recharge area using a new pump station and pipeline.

As part of the Replenish Big Bear Program, the following will be constructed:

- A new 471 gpm pump station near the snowmaking pond, at the BBLDWP Sand Canyon Well site, to convey water to Sand Canyon.
- A new 8-inch pipeline that will discharge into Sand Canyon and will be approximately 7,200 feet in length.
- Two monitoring wells for groundwater recharge at Sand Canyon, as required by the future discharge permit.
- Installation of erosion control using rip rap or similar erosion control methods, at Sand Canyon.

2 FUNDAMENTALS

Noise is simply defined as "unwanted sound." Sound becomes unwanted when it interferes with normal activities, when it causes actual physical harm or when it has adverse effects on health. Noise is measured on a logarithmic scale of sound pressure level known as a decibel (dB). A-weighted decibels (dBA) approximate the subjective response of the human ear to broad frequency noise source by discriminating against very low and very high frequencies of the audible spectrum. They are adjusted to reflect only those frequencies which are audible to the human ear. Exhibit 2-A presents a summary of the typical noise levels and their subjective loudness and effects that are described in more detail below.

EXHIBIT 2-A: TYPICAL NOISE LEVELS

COMMON OUTDOOR ACTIVITIES	COMMON INDOOR ACTIVITIES	A - WEIGHTED SOUND LEVEL dBA	SUBJECTIVE LOUDNESS	EFFECTS OF NOISE
THRESHOLD OF PAIN		140	INTOLERABLE OR DEAFENING	HEARING LOSS
NEAR JET ENGINE		130		
		120		
JET FLY-OVER AT 300m (1000 ft)	ROCK BAND	110		
LOUD AUTO HORN		100	VERY NOISY	
GAS LAWN MOWER AT 1m (3 ft)		90		
DIESEL TRUCK AT 15m (50 ft), at 80 km/hr (50 mph)	FOOD BLENDER AT 1m (3 ft)	80		SPEECH INTERFERENCE
NOISY URBAN AREA, DAYTIME	VACUUM CLEANER AT 3m (10 ft)	70	LOUD	
HEAVY TRAFFIC AT 90m (300 ft)	NORMAL SPEECH AT 1m (3 ft)	60		
QUIET URBAN DAYTIME	LARGE BUSINESS OFFICE	50	MODERATE	SLEEP DISTURBANCE
QUIET URBAN NIGHTTIME	THEATER, LARGE CONFERENCE ROOM (BACKGROUND)	40		
QUIET SUBURBAN NIGHTTIME	LIBRARY	30	FAINT	NO EFFECT
QUIET RURAL NIGHTTIME	BEDROOM AT NIGHT, CONCERT HALL (BACKGROUND)	20		
	BROADCAST/RECORDING STUDIO	10	VERY FAINT	
LOWEST THRESHOLD OF HUMAN HEARING	LOWEST THRESHOLD OF HUMAN HEARING	0

2.1 RANGE OF NOISE

Since the range of intensities that the human ear can detect is so large, the scale frequently used to measure intensity is a scale based on multiples of 10, the logarithmic scale. The scale for measuring intensity is the decibel scale. Each interval of 10 decibels indicates a sound energy ten times greater than before, which is perceived by the human ear as being roughly twice as loud. (2) The most common sounds vary between 40 dBA (very quiet) to 100 dBA (very loud). Normal conversation at three feet is roughly at 60 dBA, while loud jet engine noises equate to 110 dBA

at approximately 100 feet, which can cause serious discomfort. (3) Another important aspect of noise is the duration of the sound and the way it is described and distributed in time.

2.2 NOISE DESCRIPTORS

Environmental noise descriptors are generally based on averages, rather than instantaneous, noise levels. The most commonly used figure is the equivalent level (L_{eq}). Equivalent sound levels are not measured directly but are calculated from sound pressure levels typically measured in A-weighted decibels (dBA). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period (typically one hour) and is commonly used to describe the "average" noise levels within the environment.

Peak hour or average noise levels, while useful, do not completely describe a given noise environment. Noise levels lower than peak hour may be disturbing if they occur during times when quiet is most desirable, namely evening and nighttime (sleeping) hours. To account for this, the Day-Night Average Noise Level (LDN) and the Community Noise Equivalent Level (CNEL), representing a composite 24-hour noise level is utilized. The LDN and CNEL are weighted averages of the intensity of a sound, with corrections for time of day, and averaged over 24 hours. The LDN time of day corrections include the addition of 10 decibels to dBA Leq sound levels at night between 10:00 p.m. and 7:00 a.m. The CNEL time of day corrections require the addition of 5 decibels to dBA Leq sound levels in the evening from 7:00 p.m. to 10:00 p.m., in addition to the corrections for the LDN. These additions are made to account for the noise sensitive time periods during the evening and night hours when sound appears louder. LDN and CNEL do not represent the actual sound level heard at any time, but rather represent the total sound exposure. The County of San Bernardino relies on the 24-hour CNEL level to assess land use compatibility with transportation related noise sources.

2.3 SOUND PROPAGATION

When sound propagates over a distance, it changes in level and frequency content. The way noise reduces with distance depends on the following factors.

2.3.1 GEOMETRIC SPREADING

Sound from a localized source (i.e., a stationary point source) propagates uniformly outward in a spherical pattern. The sound level attenuates (or decreases) at a rate of 6 dB for each doubling of distance from a point source. Highways consist of several localized noise sources on a defined path and hence can be treated as a line source, which approximates the effect of several point sources. Noise from a line source propagates outward in a cylindrical pattern, often referred to as cylindrical spreading. Sound levels attenuate at a rate of 3 dB for each doubling of distance from a line source. (2)

2.3.2 GROUND ABSORPTION

The propagation path of noise from a highway to a receiver is usually very close to the ground. Noise attenuation from ground absorption and reflective wave canceling adds to the attenuation

associated with geometric spreading. Traditionally, the excess attenuation has also been expressed in terms of attenuation per doubling of distance. This approximation is usually sufficiently accurate for distances of less than 200 ft. For acoustically hard sites (i.e., sites with a reflective surface between the source and the receiver, such as a parking lot or body of water), no excess ground attenuation is assumed. For acoustically absorptive or soft sites (i.e., those sites with an absorptive ground surface between the source and the receiver such as soft dirt, grass, or scattered bushes and trees), an excess ground attenuation value of 1.5 dB per doubling of distance is normally assumed. When added to the cylindrical spreading, the excess ground attenuation results in an overall drop-off rate of 4.5 dB per doubling of distance from a line source. (4)

2.3.3 ATMOSPHERIC EFFECTS

Receivers located downwind from a source can be exposed to increased noise levels relative to calm conditions, whereas locations upwind can have lowered noise levels. Sound levels can be increased at large distances (e.g., more than 500 feet) due to atmospheric temperature inversion (i.e., increasing temperature with elevation). Other factors such as air temperature, humidity, and turbulence can also have significant effects. (2)

2.3.4 SHIELDING

A large object or barrier in the path between a noise source and a receiver can substantially attenuate noise levels at the receiver. The amount of attenuation provided by shielding depends on the size of the object and the frequency content of the noise source. Shielding by trees and other such vegetation typically only has an “out of sight, out of mind” effect. That is, the perception of noise impact tends to decrease when vegetation blocks the line-of-sight to nearby residents. However, for vegetation to provide a substantial, or even noticeable, noise reduction, the vegetation area must be at least 15 feet in height, 100 feet wide and dense enough to completely obstruct the line-of sight between the source and the receiver. This size of vegetation may provide up to 5 dBA of noise reduction. The FHWA does not consider the planting of vegetation to be a noise abatement measure. (4)

2.4 NOISE CONTROL

Noise control is the process of obtaining an acceptable noise environment for an observation point or receiver by controlling the noise source, transmission path, receiver, or all three. This concept is known as the source-path-receiver concept. In general, noise control measures can be applied to these three elements.

2.5 NOISE BARRIER ATTENUATION

Effective noise barriers can reduce noise levels by up to 10 to 15 dBA, cutting the loudness of traffic noise in half. A noise barrier is most effective when placed close to the noise source or receiver. Noise barriers, however, do have limitations. For a noise barrier to work, it must be high enough and long enough to block the path of the noise source. (4)

2.6 LAND USE COMPATIBILITY WITH NOISE

Some land uses are more tolerant of noise than others. For example, schools, hospitals, churches, and residences are more sensitive to noise intrusion than are commercial or industrial developments and related activities. As ambient noise levels affect the perceived amenity or livability of a development, so too can the mismanagement of noise impacts impair the economic health and growth potential of a community by reducing the area's desirability as a place to live, shop and work. For this reason, land use compatibility with the noise environment is an important consideration in the planning and design process. The FHWA encourages State and Local government to regulate land development in such a way that noise-sensitive land uses are either prohibited from being located adjacent to a highway, or that the developments are planned, designed, and constructed in such a way that noise impacts are minimized. (5)

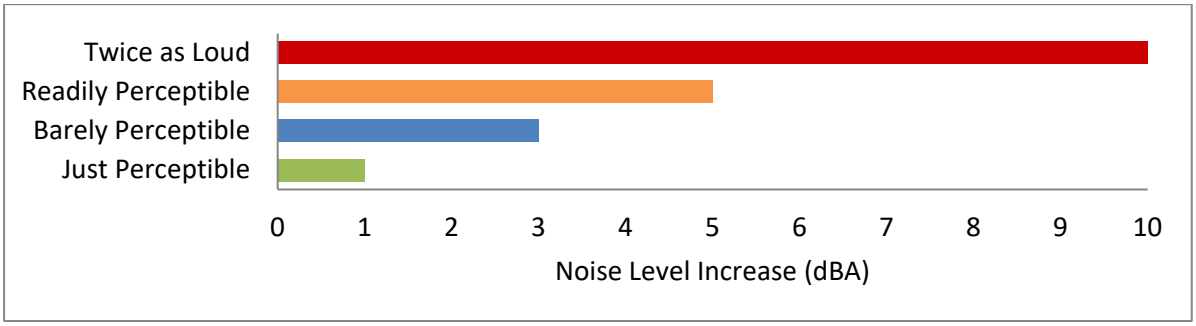
2.7 COMMUNITY RESPONSE TO NOISE

Community responses to noise may range from registering a complaint by telephone or letter, to initiating court action, depending upon everyone's susceptibility to noise and personal attitudes about noise. Several factors are related to the level of community annoyance including:

- Fear associated with noise producing activities;
- Socio-economic status and educational level;
- Perception that those affected are being unfairly treated;
- Attitudes regarding the usefulness of the noise-producing activity;
- Belief that the noise source can be controlled.

Approximately ten percent of the population has a very low tolerance for noise and will object to any noise not of their making. Consequently, even in the quietest environment, some complaints will occur. Twenty-five percent of the population will not complain even in very severe noise environments. Thus, a variety of reactions can be expected from people exposed to any given noise environment. (6) Surveys have shown that about ten percent of the people exposed to traffic noise of 60 dBA will report being highly annoyed with the noise, and each increase of one dBA is associated with approximately two percent more people being highly annoyed. When traffic noise exceeds 60 dBA or aircraft noise exceeds 55 dBA, people may begin to complain. (6) Despite this variability in behavior on an individual level, the population can be expected to exhibit the following responses to changes in noise levels as shown on Exhibit 2-B. A change of 3 dBA are considered *barely perceptible*, and changes of 5 dBA are considered *readily perceptible*. (4)

EXHIBIT 2-B: NOISE LEVEL INCREASE PERCEPTION



2.8 VIBRATION

Per the Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual*, vibration is the periodic oscillation of a medium or object. The rumbling sound caused by the vibration of room surfaces is called structure-borne noise. Sources of ground-borne vibrations include natural phenomena (e.g., earthquakes, volcanic eruptions, sea waves, landslides) or human-made causes (e.g., explosions, machinery, traffic, trains, construction equipment). Vibration sources may be continuous, such as factory machinery, or transient, such as explosions. As is the case with airborne sound, ground-borne vibrations may be described by amplitude and frequency.

Additionally, in contrast to airborne noise, ground-borne vibration outdoors is not a common environmental problem and annoyance from ground-borne vibration is almost exclusively an indoor phenomenon (7). Therefore, the effects of vibrations should only be evaluated at a structure and the effects of the building structure on the vibration should be considered. Wood-frame buildings, such as typical residential structures, are more easily excited by ground vibration than heavier buildings. In contrast, large masonry buildings with spread footings have a low response to ground vibration (7). In general, the heavier a building is, the lower the response will be to the incident vibration energy. However, all structurers reduce vibration levels due to the coupling of the building to the soil.

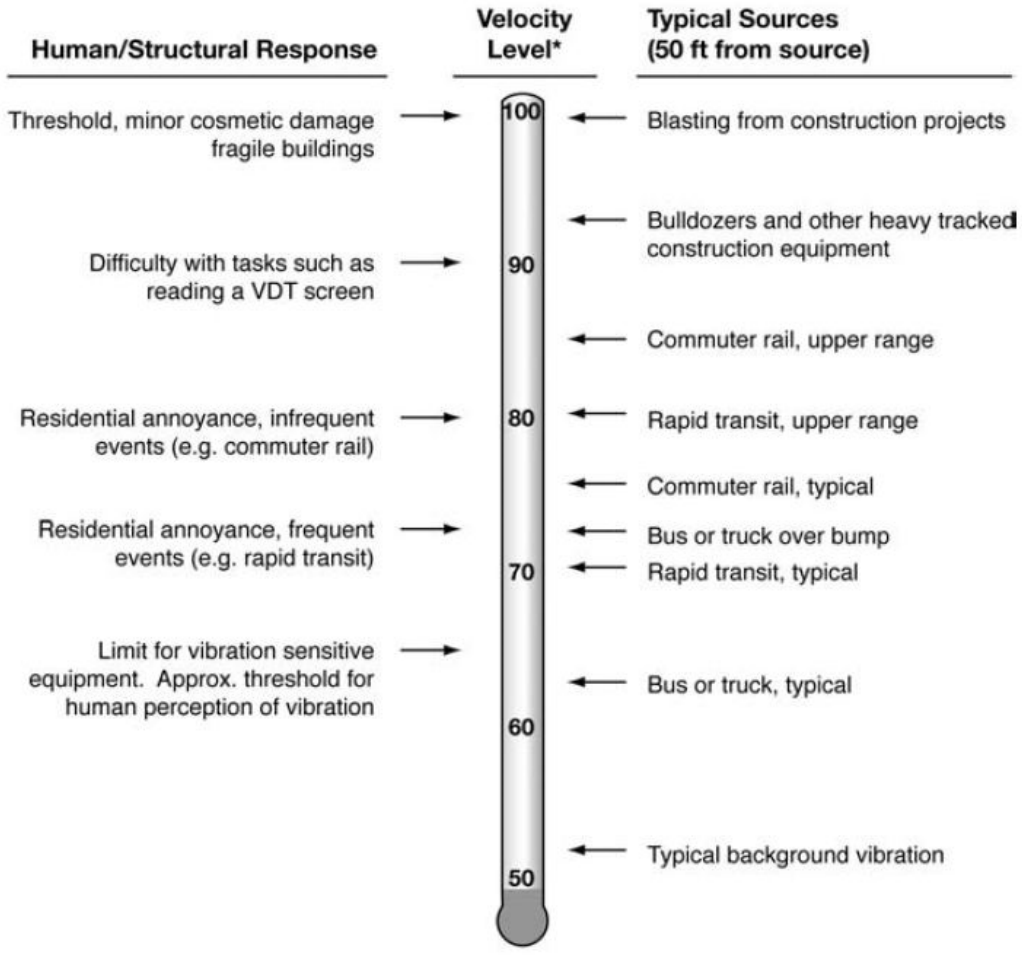
There are several different methods that are used to quantify vibration. The peak particle velocity (PPV) is defined as the maximum instantaneous peak of the vibration signal (7). The PPV is most frequently used to describe vibration impacts to buildings but is not always suitable for evaluating human response (annoyance) because it takes some time for the human body to respond to vibration signals. Instead, the human body responds to average vibration amplitude often described as the root mean square (RMS). The RMS amplitude is defined as the average of the squared amplitude of the signal and is most frequently used to describe the effect of vibration on the human body (7). However, the RMS amplitude and PPV are related mathematically, and the RMS amplitude of equipment is typically calculated from the PPV reference level. The RMS amplitude is approximately 70% of the PPV (8). Thus, either can be used on the description of vibration impacts.

While not universally accepted, vibration decibel notation (VdB) is another vibration notation developed and used by the FTA in their guidance manual to describe vibration levels and provide

a background of common vibration levels and set vibration limits (9). Decibel notation (VdB) serves to reduce the range of numbers used to describe vibration levels and is used in this report to describe vibration levels.

As stated in the FTA guidance manual, the background vibration-velocity level in residential areas is generally 50 VdB. Ground-borne vibration is normally perceptible to humans at approximately 65 VdB. For most people, a vibration-velocity level of 75 VdB is the approximate dividing line between barely perceptible and distinctly perceptible levels. Typical outdoor sources of perceptible ground-borne vibration are construction equipment, steel-wheeled trains, and traffic on rough roads. If a roadway is smooth, the ground-borne vibration is rarely perceptible. The range of interest is from approximately 50 VdB, which is the typical background vibration-velocity level, to 100 VdB, which is the general threshold where minor damage can occur in fragile buildings. Exhibit 2-C illustrates common vibration sources and the human and structural response to ground-borne vibration.

EXHIBIT 2-C: TYPICAL LEVELS OF GROUND-BORNE VIBRATION



** RMS Vibration Velocity Level in VdB relative to 10^{-6} inches/second*

3 REGULATORY SETTING

To limit population exposure to physically and/or psychologically damaging as well as intrusive noise levels, the federal government, the State of California, various county governments, and most municipalities in the state have established standards and ordinances to control noise. In most areas, automobile and truck traffic is the major source of environmental noise. Traffic activity generally produces an average sound level that remains constant with time. Air and rail traffic, and commercial and industrial activities are also major sources of noise in some areas. Federal, state, and local agencies regulate different aspects of environmental noise. Federal and state agencies generally set noise standards for mobile sources such as aircraft and motor vehicles, while regulation of stationary sources is left to local agencies.

3.1 STATE OF CALIFORNIA NOISE REQUIREMENTS

The State of California regulates freeway noise, sets standards for sound transmission, provides occupational noise control criteria, identifies noise standards, and provides guidance for local land use compatibility. State law requires that each county and city adopt a General Plan that includes a Noise Element which is to be prepared per guidelines adopted by the Governor's Office of Planning and Research (OPR). (10) The purpose of the Noise Element is to *limit the exposure of the community to excessive noise levels*. In addition, the California Environmental Quality Act (CEQA) requires that all known environmental effects of a project be analyzed, including environmental noise impacts.

3.2 BIG BEAR AREA REGIONAL WASTEWATER AGENCY'S

The BBARWA does not have specific noise ordinances or standards and while the BBARWA is not subject to local noise standards under CEQA, for purposes of this project the BBAQWA considers the County of San Bernardino noise standards in the determination of impacts. The County noise standards and ordinances are summarized in the following discussion.

3.2 COUNTY OF SAN BERNARDINO COUNTYWIDE PLAN

The County of San Bernardino has adopted a Countywide Plan Hazards Element, in part, to limit the exposure of the community to excessive noise levels. In most cases, no single goal, policy, or implementation program is expected to completely avoid or reduce an identified potential environmental impact. However, the collective, cumulative mitigating benefits of the polices listed below are intended to reduce noise-related impacts. Specific goals and policies are discussed in Section 5.12.4, Environmental Impacts, to demonstrate how the policy would avoid or reduce the impact. (11)

HZ-2 Human Generated Hazards: People and the natural environment protected from exposure to hazardous materials, excessive noise, and other human-generated hazards.

HZ-2.6 Coordination with Transportation Authorities: We collaborate with airport owners, FAA, Caltrans, SBCTA, SCAG, neighboring jurisdictions, and other transportation providers in the preparation and maintenance of, and updates to transportation-related plans and projects to minimize noise impacts and provide appropriate mitigation measures.

HZ-2.7 Truck Delivery Areas: We encourage truck delivery areas to be located away from residential properties and require associated noise impacts to be mitigated.

HZ-2.8 Proximity to Noise Generating Uses: We limit to restrict new noise sensitive land uses in proximity to existing conforming noise generating uses and planned industrial areas.

HZ-2.9 Control Sound at the Source: We prioritize noise mitigation measures that control sound at the source before buffers, soundwalls and other perimeter measures.

HZ-2.10 Agricultural Operations: We require new development adjacent to existing conforming agricultural operations to provide adequate buffers to reduce the exposure of new development to operational noise, odor, and the storage or application of pesticides or other hazardous materials.

3.3 COUNTY OF SAN BERNARDINO DEVELOPMENT CODE

While the County of San Bernardino Hazards Element provides guidelines and criteria to assess transportation noise on sensitive land uses, the County Code, Title 8 Development Code contains the noise level limits for mobile, stationary, and construction-related noise sources. (12)

3.3.1 TRANSPORTATION NOISE STANDARDS

Section 83.01.080(d), Table 83-3, contains the County of San Bernardino's mobile noise source-related standards, shown on Exhibit 3-A. Based on the County's mobile noise source standards, there are no exterior noise level standards for the Project commercial land use. Exterior transportation (mobile) noise level standards for residential land uses in the Project study area are shown to be 60 dBA CNEL, while non-noise-sensitive land uses, such as office uses, require exterior noise levels of 65 dBA CNEL per the County's Table 83-3 mobile noise source standards.

EXHIBIT 3-A: COUNTY OF SAN BERNARDINO MOBILE NOISE LEVEL STANDARDS

Noise Standards for Adjacent Mobile Noise Sources			
Land Use		*Ldn (or CNEL) dB(A)*	
Categories	*Uses*	*Interior (1)*	*Exterior (2)*
Residential	Single and multi-family, duplex, mobile homes	45	60(3)
Commercial	Hotel, motel, transient housing	45	60(3)
	Commercial retail, bank, restaurant	50	N/A
	Office building, research and development, professional offices	45	65
	Amphitheater, concert hall, auditorium, movie theater	45	N/A
Institutional/Public	Hospital, nursing home, school classroom, religious institution, library	45	65
Open Space	Park	N/A	65

Notes:

(1) The indoor environment shall exclude bathrooms, kitchens, toilets, closets and corridors.

(2) The outdoor environment shall be limited to:

- Hospital/office building patios
- Hotel and motel recreation areas
- Mobile home parks
- Multi-family private patios or balconies
- Park picnic areas
- Private yard of single-family dwellings
- School playgrounds

(3) An exterior noise level of up to 65 dB(A) (or CNEL) shall be allowed provided exterior noise levels have been substantially mitigated through a reasonable application of the best available noise reduction technology, and interior noise exposure does not exceed 45 dB(A) (or CNEL) with windows and doors closed. Requiring that windows and doors remain closed to achieve an acceptable interior noise level shall necessitate the use of air conditioning or mechanical ventilation.

CNEL = (Community Noise Equivalent Level). The average equivalent A-weighted sound level during a 24-hour day, obtained after addition of approximately five decibels to sound levels in the evening from 7:00 p.m. to 10:00 p.m. and ten decibels to sound levels in the night from 10:00 p.m. to 7:00 a.m.

Source: County of San Bernardino County Code, Title 8 Development Code, Table 83-3.

3.3.2 OPERATIONAL NOISE STANDARDS

To analyze noise impacts originating from a designated fixed location or private property such as the Replenish Big Bear Project, stationary-source (operational) noise such as the expected pumps, compressors, and the drilling rig are typically evaluated against standards established under a jurisdiction's Municipal Code. The County of San Bernardino County Code, Title 8 Development Code, Section 83.01.080(c) establishes the noise level standards for stationary noise sources. Since the Project's land use will potentially impact adjacent noise-sensitive uses in the Project study area, this noise study relies on the more conservative residential noise level standards to describe potential operational noise impacts.

For residential properties, the exterior noise level shall not exceed 55 dBA L_{eq} during the daytime hours (7:00 a.m. to 10:00 p.m.) and 45 dBA L_{eq} during the nighttime hours (10:00 p.m. to 7:00 a.m.) for both the whole hour, and for not more than 30 minutes in any hour. (12) The exterior noise level standards shall apply for a cumulative period of 30 minutes in any hour, as well as the standard plus 5 dBA cannot be exceeded for a cumulative period of more than 15 minutes in any hour, or the standard plus 10 dBA for a cumulative period of more than 5 minutes in any hour, or the standard plus 15 dBA for a cumulative period of more than 1 minute in any hour, or the

standard plus 20 dBA for any period of time. Further, Section 83.01.080(e) indicates that if the existing ambient noise level already exceeds any of the exterior noise level limit categories, then the standard shall be adjusted to reflect the ambient conditions. The County of San Bernardino operational noise level standards are shown on Table 3-1 and included in Appendix 3.1.

TABLE 3-1: OPERATIONAL NOISE LEVEL STANDARDS

Affected Land Uses (Receiving Noise)	7:00 a.m. - 10:00 p.m. (dBA L_{eq})	10:00 p.m. - 7:00 a.m. (dBA L_{eq})
Residential	55	45
Professional Services	55	55
Other Commercial	60	60
Industrial	70	70

L_{eq} = (Equivalent Energy Level). The sound level corresponding to a steady-state sound level containing the same total energy as a time-varying signal over a given sample period, typically one, eight or 24 hours.
dB(A) = (A-weighted Sound Pressure Level). The sound pressure level, in decibels, as measured on a sound level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very low and very high frequency components of the sound, placing greater emphasis on those frequencies within the sensitivity range of the human ear.

The percentile noise descriptors are provided to ensure that the duration of the noise source is fully considered. However, due to the relatively constant intensity of the Project operational activities, the L_{50} or average L_{eq} noise level metrics best describe the pumps, compressors, and the drilling rig. In addition, the L_{eq} noise level metric accounts for noise fluctuations over time by averaging the louder and quieter events and giving more weight to the louder events. In addition, due to the mathematical relationship between the median (L_{50}) and the mean (L_{eq}), the L_{eq} will always be larger than or equal to the L_{50}. The more variable the noise becomes, the larger the L_{eq} becomes in comparison to the L_{50}. Therefore, this noise study conservatively relies on the average L_{eq} sound level limits to describe the Project operational noise levels.

3.4 CONSTRUCTION NOISE STANDARDS

Section 83.01.080(g)(3) of the County of San Bernardino Development Code, provided in Appendix 3.1, indicates that construction activity is considered exempt from the noise level standards between the hours of 7:00 a.m. to 7:00 p.m. except on Sundays and Federal holidays. (12) However, neither the County of San Bernardino General Plan or Municipal Code establish numeric maximum acceptable construction source noise levels at potentially affected receivers, which would allow for a quantified determination of what CEQA constitutes a *substantial temporary or periodic noise increase*. Therefore, a numerical construction threshold based on Federal Transit Administration (FTA) *Transit Noise and Vibration Impact Assessment Manual* is used for analysis of daytime construction impacts, as discussed below.

According to the FTA, local noise ordinances are typically not very useful in evaluating construction noise. They usually relate to nuisance and hours of allowed activity, and sometimes specify limits in terms of maximum levels, but are generally not practical for assessing the impact of a construction project. Project construction noise criteria should account for the existing noise

environment, the absolute noise levels during construction activities, the duration of the construction, and the adjacent land use. Due to the lack of standardized construction noise thresholds, the FTA provides guidelines that can be considered reasonable criteria for construction noise assessment. The FTA considers a daytime exterior construction noise level of 80 dBA L_{eq} as a threshold for noise sensitive residential land use, a noise level of 85 dBA L_{eq} for commercial locations, and 90 dBA L_{eq} for industrial locations. (7)

3.5 CONSTRUCTION VIBRATION STANDARDS

Construction activity can result in varying degrees of ground-borne vibration, depending on the equipment and methods used, distance to the affected structures and soil type. Construction vibration is generally associated with pile driving and rock blasting. Other construction equipment such as air compressors, light trucks, hydraulic loaders, etc., generates little or no ground vibration. (7)

The County of San Bernardino Development Code, Section 83.01.090(a) states that vibration shall be no *greater than or equal to two-tenths inches per second measured at or beyond the lot line*. (12) Therefore, to determine if the vibration levels due to the operation and construction of the Project, the peak particle velocity (PPV) vibration level standard of 0.2 inches per second is used.

This page intentionally left blank

4 SIGNIFICANCE CRITERIA

The following significance criteria are based on currently adopted guidance provided by Appendix G of the California Environmental Quality Act (CEQA) Guidelines. (13) For the purposes of this report, impacts would be potentially significant if the Project results in or causes:

A. Generation of a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

B. Generation of excessive ground-borne vibration or ground-borne noise levels?

C. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

While the County of San Bernardino General Plan Guidelines provide direction on noise compatibility and establish noise standards by land use type that are sufficient to assess the significance of noise impacts, they do not define the levels at which increases are considered substantial for use under Guideline A. CEQA Appendix G Guideline C applies to nearby public and private airports, if any, and the Project's land use compatibility..

4.1 CEQA GUIDELINES NOT FURTHER ANALYZED

The Project site is located adjacent Big Bear Airport and one option would locate a pipeline within the Big Bear Airport. However, the project would not erect any structures near the airport and would not locate any incompatible land uses within the airport influence area (14). The Project is a water infrastructure development and would not place people within the airport land use plan area. As such, the Project site would not be exposed to excessive noise levels from airport operations and would not conflict with the airport land use plan, and therefore, impacts are considered *less than significant,* and no further noise analysis is conducted in relation to Guideline C.

The Project site will not include any residential or commercial office space and thus does not conflict with any interior noise level requirements. Similarly, the project would not result in substantial new trips on local roadways, rather future maintenance activities at new facilities would be carried out by the existing maintenance crews and the BBARWA WWTP upgrades would not require substantial new staff. Therefore, the Project would not result in a substantial off-site traffic increase.

4.2 SIGNIFICANCE CRITERIA SUMMARY

Noise impacts shall be considered significant if any of the following occur as a direct result of the proposed development. Table 4-1 shows the significance criteria summary matrix that includes the allowable criteria used to identify potentially significant incremental noise level increases.

TABLE 4-1: SIGNIFICANCE CRITERIA SUMMARY

Analysis	Land Use	Condition(s)	Significance Criteria	
			Daytime	**Nighttime**
Construction	Noise-Sensitive	Permitted between 7:00 a.m. to 7:00 p.m.; except Sundays and Federal holidays.[3]		
		Noise Level Threshold[1]	80 dBA L_{eq}	n/a
		Vibration Level Threshold[4]	0.2 PPV in/sec	n/a

[1] Federal Transit Administration, Transit Noise and Vibration Impact Assessment Manual.
[2] County of San Bernardino Development Code, Title 8, Section 83.01.080 (Appendix 3.1)
[3] Section 83.01.080(g)(3) of the County of San Bernardino County Code.
[4] Section 83.01.090(a) of the County of San Bernardino County Code.
"Daytime" = 7:00 a.m. to 10:00 p.m.; "Nighttime" = 10:00 p.m. to 7:00 a.m. "n/a" = construction activities are not planned during the nighttime hours; "PPV" = peak particle velocity.

5 EXISTING NOISE LEVEL MEASUREMENTS

To assess the existing noise level environment, 24-hour noise level measurements were taken at six locations in the Project study area. The receiver locations were selected to describe and document the existing noise environment within the Project study area. Exhibits 5-A and 5-B provide the noise level measurement locations. To fully describe the existing noise conditions, noise level measurements were collected by Urban Crossroads, Inc. on Wednesday, July 12, 2023. Appendix 5.1 includes study area photos.

5.1 MEASUREMENT PROCEDURE AND CRITERIA

To describe the existing noise environment, the hourly noise levels were measured during typical weekday conditions over a 24-hour period. By collecting individual hourly noise level measurements, it is possible to describe the equivalent daytime and nighttime hourly noise levels. The long-term noise readings were recorded using Piccolo Type 2 integrating sound level meter and dataloggers. The Piccolo sound level meters were calibrated using a Larson-Davis calibrator, Model CAL 150. All noise meters were programmed in "slow" mode to record noise levels in "A" weighted form. The sound level meters and microphones were equipped with a windscreen during all measurements. All noise level measurement equipment satisfies the American National Standards Institute (ANSI) standard specifications for sound level meters ANSI S1.4-2014/IEC 61672-1:2013. (15)

5.2 NOISE MEASUREMENT LOCATIONS

The long-term noise level measurements were positioned as close to the nearest sensitive receiver locations as possible to assess the existing ambient hourly noise levels surrounding the Project site. Both Caltrans and the FTA recognize that it is not reasonable to collect noise level measurements that can fully represent every part of a private yard, patio, deck, or balcony normally used for human activity when estimating impacts for new development projects. This is demonstrated in the Caltrans general site location guidelines which indicate that, *sites must be free of noise contamination by sources other than sources of interest. Avoid sites located near sources such as barking dogs, lawnmowers, pool pumps, and air conditioners unless it is the express intent of the analyst to measure these sources*. (2) Further, FTA guidance states, t*hat it is not necessary nor recommended that existing noise exposure be determined by measuring at every noise-sensitive location in the project area. Rather, the recommended approach is to characterize the noise environment for clusters of sites based on measurements or estimates at representative locations in the community*. (16)

Based on recommendations of Caltrans and the FTA, it is not necessary to collect measurements at each individual building or residence, because each receiver measurement represents a group of buildings that share acoustical equivalence. (16) Collecting reference ambient noise level measurements at the nearest sensitive receiver locations allows for a comparison of the before and after Project noise levels and is necessary to assess potential noise impacts due to the Project's contribution to the ambient noise levels.

EXHIBIT 5-A: NOISE MEASUREMENT LOCATIONS 1 TO 3

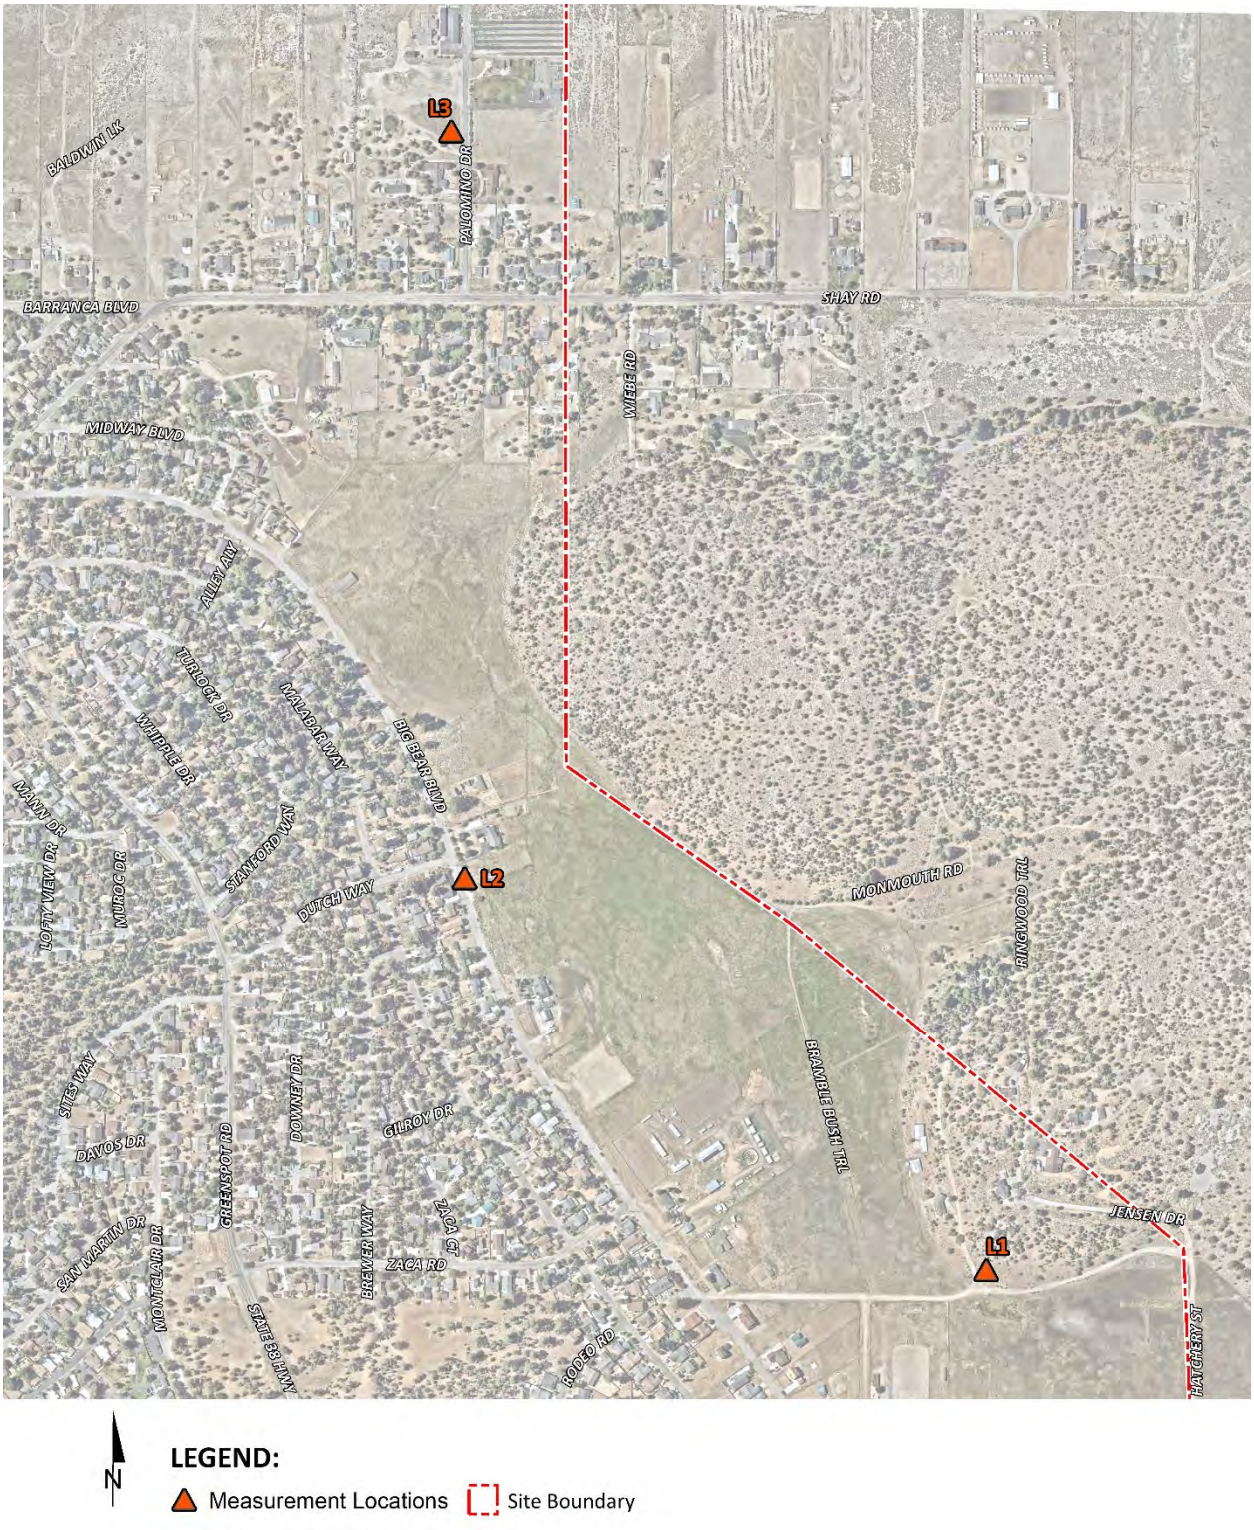

EXHIBIT 5-B: NOISE MEASUREMENT LOCATIONS 4 TO 6

5.3 NOISE MEASUREMENT RESULTS

The noise measurements presented below focus on the average or equivalent sound levels (L_{eq}). The equivalent sound level (L_{eq}) represents a steady state sound level containing the same total energy as a time varying signal over a given sample period. Table 5-1 identifies the hourly daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) noise levels at each noise level measurement location during typical weekday Friday conditions and weekend Saturday conditions. Appendix 5.2 provides a summary of the existing hourly ambient noise levels described below:

TABLE 5-1: 24-HOUR AMBIENT NOISE LEVEL MEASUREMENTS

Location[1]	Description	Energy Average Noise Level (dBA L_{eq})[2]	
		Daytime	Nighttime
L1	Northwest of Shay Pond near 2025 Garnet Street	46.7	42.7
L2	Located near 1485 E Big Bear Blvd	51.6	43.0
L3	Located near 109 Palomino Drive	46.9	44.3
L4	Located near 1467 Lassen Drive	42.1	46.9
L5	Located near 43652 Sand Canyon Road	48.3	38.3
L6	Located near 43485 Colusa Drive	42.9	40.5

[1] See Exhibit 5-A and B for the noise level measurement locations.
[2] Energy (logarithmic) equivalent levels. The long-term 24-hour measurement worksheets are included in Appendix 5.2. "Daytime" = 8:00 a.m. to 10:00 p.m.; "Nighttime" = 10:01 p.m. to 7:59 a.m.

Table 5-1 provides the (energy average) noise levels used to describe the daytime and nighttime ambient conditions. These daytime and nighttime energy average noise levels represent the average of all hourly noise levels observed during these time periods expressed as a single number. Appendix 5.2 provides summary worksheets of the noise levels for each hour as well as the minimum, maximum, L_1, L_2, L_5, L_8, L_{25}, L_{50}, L_{90}, L_{95}, and L_{99} percentile noise levels observed during the daytime and nighttime periods. The background ambient noise levels in the Project study area are dominated by the transportation-related noise associated with surface streets.

6 RECEIVER LOCATIONS

To assess the potential for operational and construction noise impacts, the following receiver locations, as shown on Exhibit 6-A, were identified as representative locations for analysis. Sensitive receivers are generally defined as locations where people reside or where the presence of unwanted sound could otherwise adversely affect the use of the land. The County of San Bernardino General Plan Noise Element defines noise-sensitive uses as residences, hospitals, convalescent and day care facilities, schools, and libraries. (17) Moderately noise-sensitive land uses typically include multi-family dwellings, hotels, motels, dormitories, out-patient clinics, cemeteries, golf courses, country clubs, athletic/tennis clubs, and equestrian clubs. Land uses that are considered relatively insensitive to noise include business, commercial, and professional developments. Land uses that are typically not affected by noise include: industrial, manufacturing, utilities, agriculture, undeveloped land, parking lots, warehousing, liquid and solid waste facilities, salvage yards, and transit terminals.

To describe the potential off-site Project noise levels, seven receiver locations in the vicinity of the Project site were identified. All distances are measured from the Project site boundary to the outdoor living areas (e.g., private backyards), Project boundary line, or at the building façade, whichever is closer to the Project site. The selection of receiver locations is based on FHWA guidelines and is consistent with additional guidance provided by Caltrans and the FTA, as previously described in Section 5.2. Other sensitive land uses in the Project study area that are located at greater distances than those identified in this noise study will experience lower noise levels than those presented in this report due to the additional attenuation from distance and the shielding of intervening structures. Distance is measured in a straight line from the project boundary to each receiver location.

R1: Location R1 represents the backyard of existing noise sensitive residence located at 109 Palomino Drive located south of the BBARWA WWTP. R1 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L3, to describe existing ambient noise level.

R2: Location R2 represents the backyard existing noise sensitive residence located at 116 Palomino Drive, south of the BBARWA WWTP. R2 is placed in the private outdoor living areas (backyard) facing the Project site.

R3: Location R3 represents an existing noise sensitive residence located at 1458 Shay Road. This residence is located east of the Shay Pond Pipeline alignment. Since there are no private outdoor living areas (e.g. backyards) facing the Project site, receiver R3 is placed at the building façade.

R4: Location R4 represents an existing noise sensitive residence located at 1485 E Big Bear Boulevard west of the Shay Pond Pipeline alignment. R4 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L2, to describe existing ambient noise level.

R5: Location R5 represents an existing noise sensitive residence located at 2025 Garnet Street east of the Shay Pond Pipeline alignment and west of Shay Pond. Receiver R5 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L1, to describe existing ambient noise level.

R6: Location R6 represents an existing noise sensitive residence located at 1467 Lassen Drive northeast of the Sand Canyon Conveyance Pipeline and Pump Station of the Project site. Receiver R6 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L4, to describe existing ambient noise level.

R7: Location R7 represents an existing noise sensitive residence located at 43861 Mendocino Drive northeast of the Sand Canyon Recharge Area. Receiver R7 is placed in the private outdoor living areas (backyard) facing the Project site.

R8: Location R8 represents an existing noise sensitive residence located at 43817 Sand Canyon Road southwest of the Sand Canyon Recharge Area. Receiver R8 is placed in the private outdoor living areas facing the Project site.

R9: Location R9 represents an existing noise sensitive residence located at 43652 Sand Canyon Road south of the Sand Canyon Recharge Area. Receiver R9 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L5, to describe existing ambient noise level.

R10: Location R10 represents an existing noise sensitive residence located at 43485 Colusa Drive northeast of the Sand Canyon Recharge Area. Receiver R10 is placed in the private outdoor living areas (backyard) facing the Project site. A 24-hour noise measurement was taken near this location, L6, to describe existing ambient noise level.

Pipeline Receivers: Receivers located along pipeline routes occur along nearly all off-site pipeline alignments. For purposes of analysis, and based on a survey of project alignments, the majority of roadways and potential rights-of-way are the width of 2 lane roadways (approximately 24 feet), thus receivers (e.g. residential buildings) are evaluated as close as 20 feet from the centerline of the pipeline construction activities.

EXHIBIT 6-D: SAND CANYON RECEIVER LOCATIONS

7 OPERATIONAL NOISE IMPACTS

The Project will include several improvements at the BBARWA WWTP, however, all new noise sources would be housed inside the new building and the two pumps at the BBARWA WWTP would be housed in concrete masonry unit (CMU) buildings. Similarly, the proposed Sand Canyon pump station would be housed in a CMU building. The proposed structures would achieve between 40 and 50 dBA in noise reduction from pump noise to exterior locations. The proposed pumps are anticipated to generate up to 60 dBA at 32 feet. Based on the anticipated reduction, pump noise would be 30 dBA L_{eq} less outside the building. Therefore, operational noise sources would be well controlled and are not anticipated to result in substantial noise level increases.

This page intentionally left blank

8 CONSTRUCTION IMPACTS

This section analyzes potential impacts resulting from the construction noise and vibration activities associated with the development of the Project.

8.1 CONSTRUCTION NOISE SOURCES

Noise generated by the Project construction equipment will include a combination of trucks, power tools, concrete mixers, and portable generators that when combined can reach high levels. The Project is construction noise sources are expected to include a combination of loaders, cranes, welders, drill rigs, diesel generators, concrete pumps and mixture of other construction equipment.

As discussed under the Project description, Project construction activities are expected to occur in the following phases:

- Component 1: BBARWA WWTP Upgrades
- Component 2: Lake Discharge Pipeline Alignment
- Component 3: Shay Pond Conveyance Pipeline
- Component 4: Evaporation Pond
- Component 5: Sand Canyon

BBARWA WWTP UPGRADES

The upgrades include the construction of a 40,000 SF building, upgrades to the oxidation ditches, a denitrification filter, ultrafiltration (UF) and reverse osmosis (RO) filtration membranes, ultraviolet disinfection with advanced oxidation process (UV -AOP), and a 0.22 million gallons per day (MGD) Pellet Reactor. The BBARWA WWTP Treatment Upgrades includes the installation of about 1,350 linear feet (LF) of brine pipeline anticipated to be sized between 8” to 10” from the pellet reactor to the solar evaporation ponds within the existing facility boundaries.

Additionally, the BBARWA WWTP Treatment Upgrades include the installation of a 50 gallon per minute (gpm) brine pump station and a 1,520 gpm pump station at the BBARWA WWTP to pump purified water to Shay Pond and Stanfield Marsh.

Construction of the BBARWA WWTP Upgrades would include typical demolition, site preparation, grading, building construction, and architectural coatings activities. It is anticipated that BBARWA WWTP Upgrades could be constructed while the evaporation ponds are being constructed and have been modeled as simultaneous construction. Exhibit 8-A shows the construction noise source locations and receiver locations used to assess the construction noise levels from the BBARWA WWTP Upgrades.

EXHIBIT 8-A: BBARWA WWTP AND EVAPORATION POND CONSTRUCTION NOISE SOURCES AND RECEIVER LOCATIONS

LAKE DISCHARGE PIPELINE ALIGNMENT

The Replenish Big Bear Program would ultimately install a pipeline utilizing one of three alignments from the WWTP to Stanfield Marsh in the amount of about 19,940 LF sized at 12" in diameter. Construction of the Lake Discharge Pipelines would include roadway demolition, pipeline installation, roadbed backfilling, grading, and paving activities. It is anticipated that Lake Discharge Pipelines would be constructed with multiple teams, however, pipeline construction would not physically overlap, rather improvements would occur in multiple locations along the alignment and represent individual events at multiple locations. For locations within existing paved right-of-way, pipeline construction is anticipated to extend 200-300 LF per day, while construction along unpaved areas would extend 400-500 LF per day. Pipeline construction is modeled as a single 200 foot long moving point source along the alignment

Receiver locations used to assess the construction noise levels from the Lake Discharge Pipelines component would occur at various locations all along the pipeline alignment, with receivers as close as 30 feet from potential construction locations. The potential pipeline alignments are Shown in Exhibit 8-B. Receivers are assumed to occur approximately 30 feet from the center of all alignments in public rights-of-way.

SHAY POND CONVEYANCE PIPELINE

The Replenish Big Bear Program would ultimately install about 710 LF of 4" pipeline to reach Shay Pond from either an existing pipeline or a new 6" pipeline that would be 5,600 LF. As such, this Replenish Big Bear Component includes the installation of up to 6,310 LF of conveyance pipeline.

Construction of the Shay Pond Conveyance Pipeline and monitoring wells would include roadway demolition, pipeline installation, backfilling, and grading, activities along Shay Road. It is anticipated that Shay Pond Conveyance Pipeline would be constructed with multiple teams. Construction along unpaved areas pipeline construction activities would extend 400-500 LF per day. Exhibit 8-C shows the construction noise source locations and receiver locations used to assess the construction noise levels from the Shay Pond Conveyance Pipeline.

EVAPORATION POND

The Replenish Big Bear Program would include between 23 and 57 acres of evaporation ponds at the BBARWA WWTP site. The ponds would be segmented into different storage basins to allow for evaporation of the brine stream in a cycle of filling with brine, allowing the brine to evaporate, and then removing remaining brine. This Replenish Big Bear Component includes the installation of up to 2 monitoring wells.

EXHIBIT 8-B: LAKE DISCHARGE PIPELINE CONSTRUCTION NOISE SOURCES

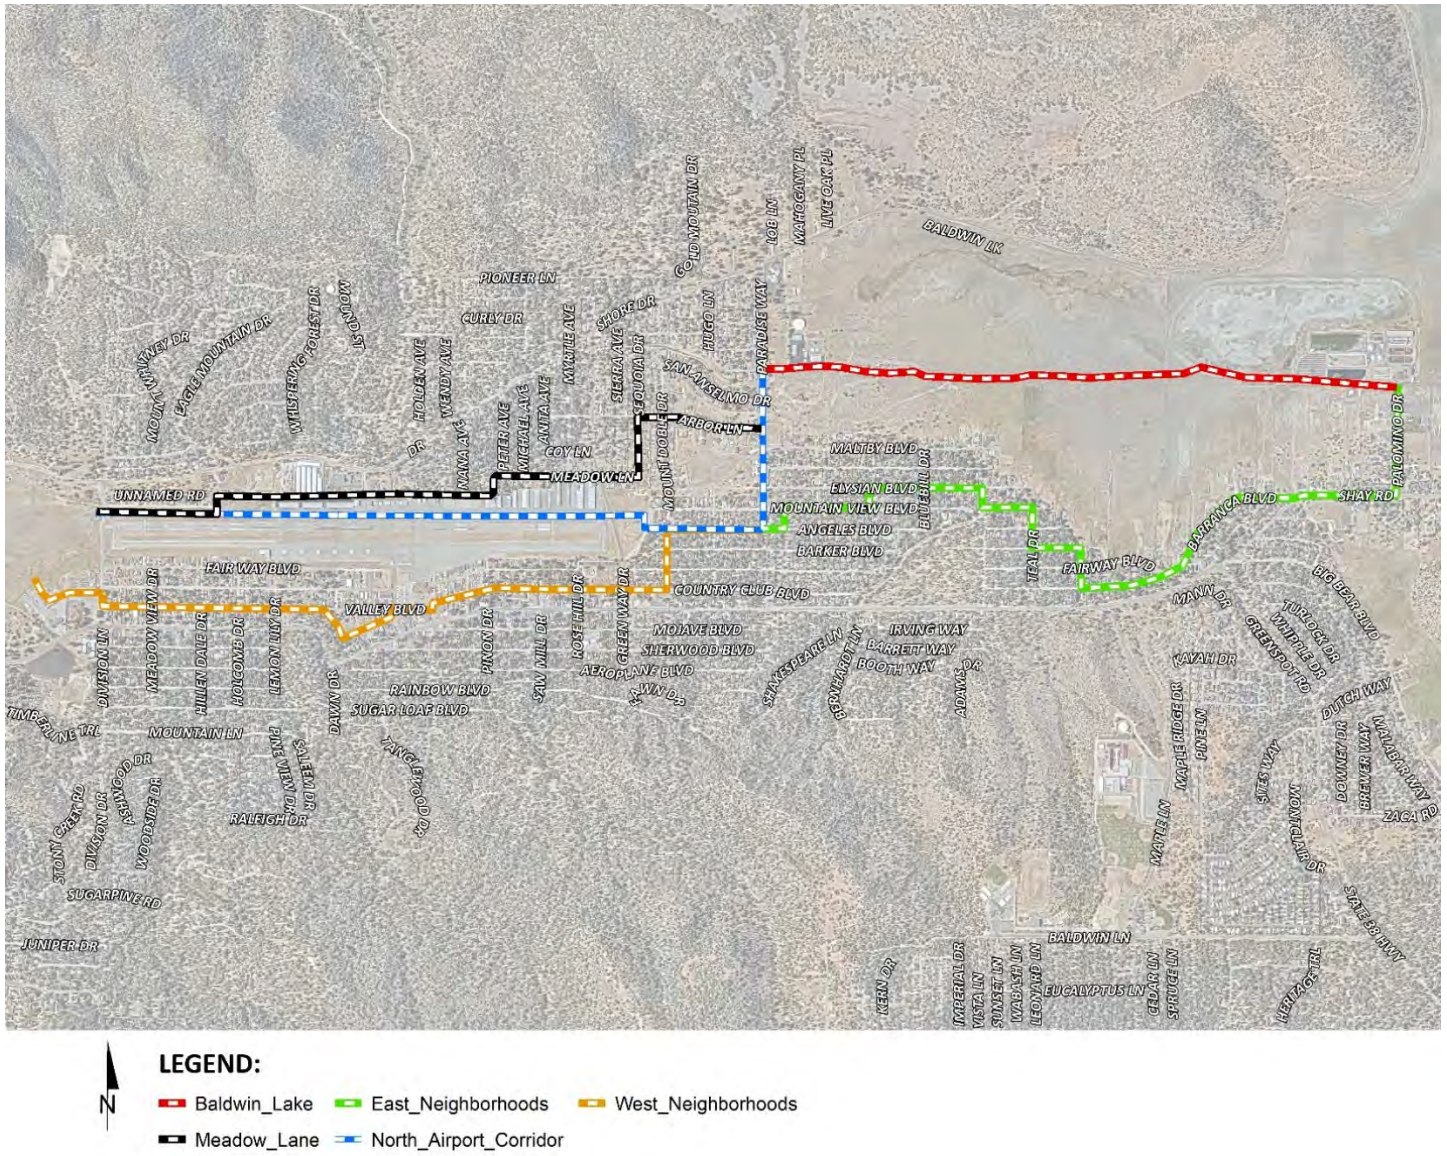

EXHIBIT 8-C: SHAY POND CONSTRUCTION NOISE SOURCES AND RECEIVER LOCATIONS

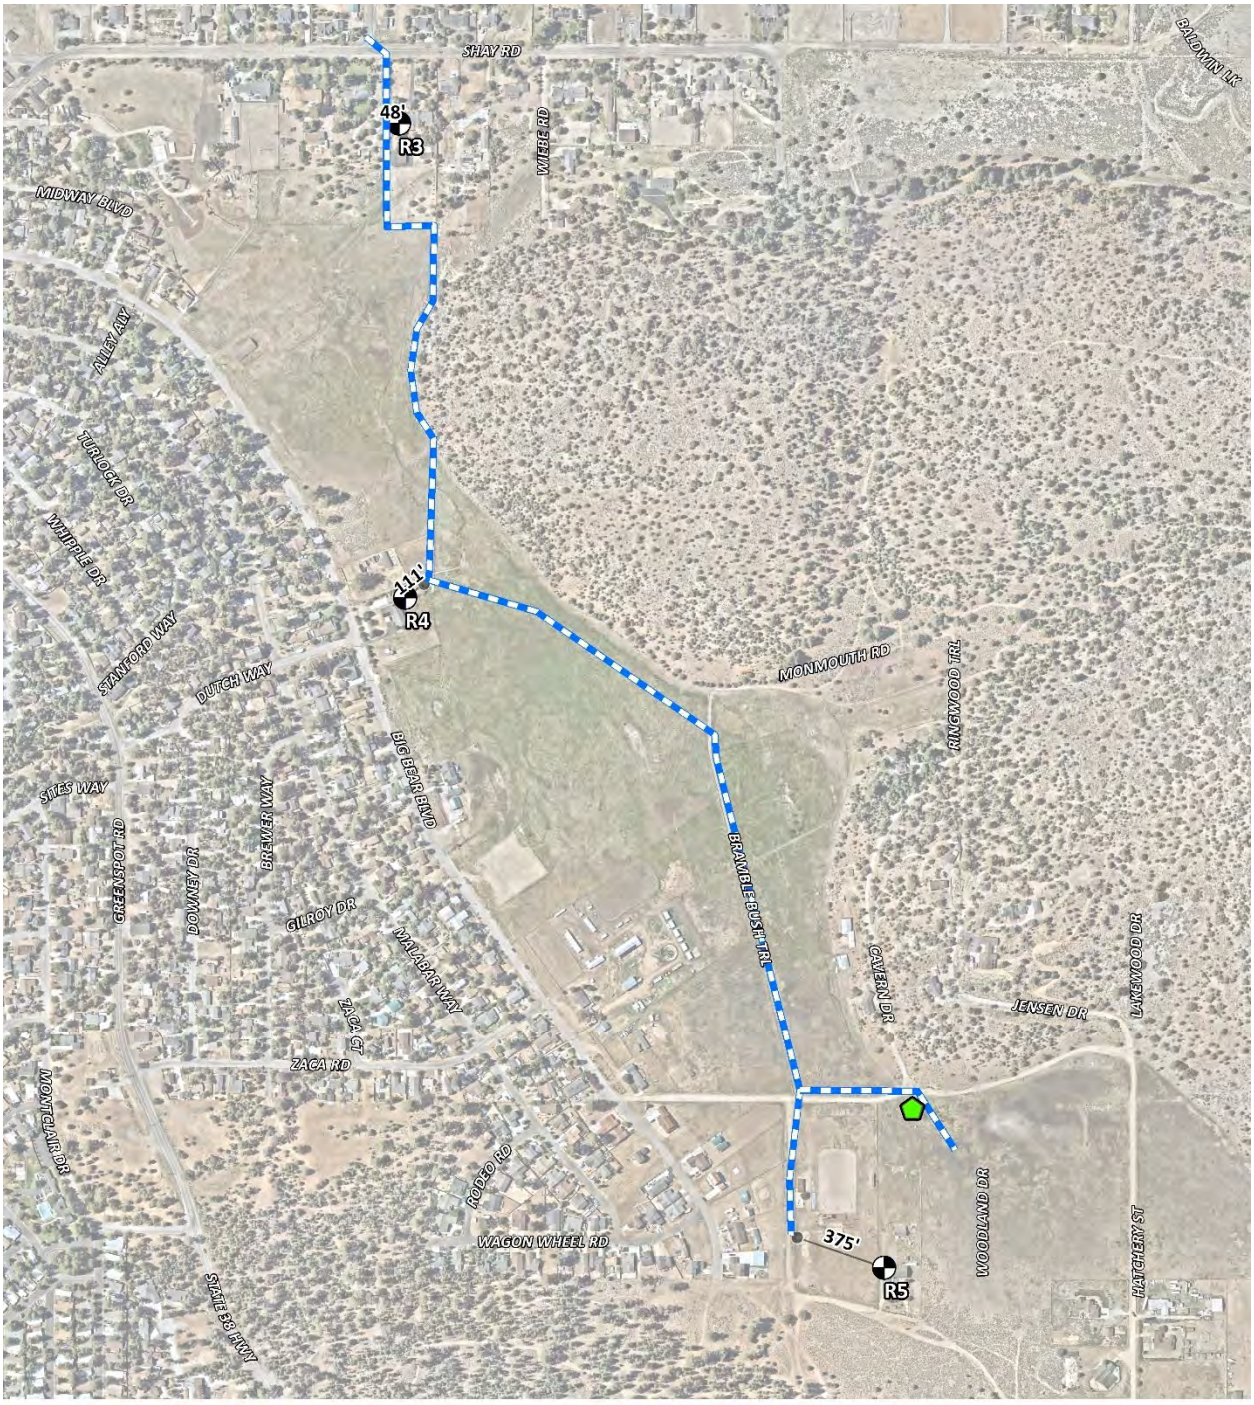

Construction of the Evaporation Pond improvements would include typical site preparation, grading, and well drilling activities. It is anticipated that Evaporation Pond improvements could be constructed while the BBARWA WWTP Upgrades are being constructed and both these activities have been modeled as simultaneous construction. Exhibit 8-A shows the construction noise source locations and receiver locations used to assess the construction noise levels from the Evaporation Pond improvements.

SAND CANYON GROUNDWATER RECHARGE

The Sand Canyon Groundwater Recharge component involves extracting Project water stored in the Lake to a temporary storage pond using existing infrastructure owned by a local resort. The Project water will then be pumped and conveyed to the Sand Canyon recharge area using a new pump station and 7,210 LF of pipeline. This Sand Canyon Groundwater Recharge improvements include the construction of a new pump station and installation of up to 2 monitoring wells at Sand Canyon.

Construction of the Sand Canyon Groundwater Recharge component would include roadway demolition, pipeline installation, roadbed backfilling, grading, paving activities, and well drilling activities. It is anticipated that Sand Canyon Groundwater Recharge improvements would be constructed with multiple teams. For locations within existing paved right-of-way, pipeline construction is anticipated to extend 200-300 LF per day, while construction along unpaved areas would extend 400-500 LF per day. Exhibit 8-D shows the pipeline locations and receiver locations used to assess the construction noise levels from the Sand Canyon Groundwater Recharge improvements.

8.2 REFERENCE CONSTRUCTION NOISE LEVELS

This construction noise analysis was prepared using reference construction equipment noise levels from the Federal Highway Administration (FHWA) published the Roadway Construction Noise Model (RCNM), which includes a national database of construction equipment reference noise emission levels. (18) The RCNM equipment database, provides a comprehensive list of the noise generating characteristics for specific types of construction equipment. In addition, the database provides an acoustical usage factor to estimate the fraction of time each piece of construction equipment is operating at full power (i.e., its loudest condition) during a construction operation. The usage factor is a key input variable of the RCNM noise prediction model that is used to calculate the average L_{eq} noise levels using the reference L_{max} noise levels measured at 50 feet. Table 8-1 provides a summary of the reference average L_{eq} noise levels used to describe each stage of construction.

Because few details are known at this time regarding construction of specific components of the Project, it is assumed that construction of any Project component may occur simultaneously. As a conservative measure, and in order to identify a reasonable worst-case scenario, this analysis assumes that the Project would construct the certain features simultaneously as discussed in Section 8.1.

EXHIBIT 8-D: SAND CANYON CONSTRUCTION NOISE SOURCE AND RECEIVER LOCATIONS

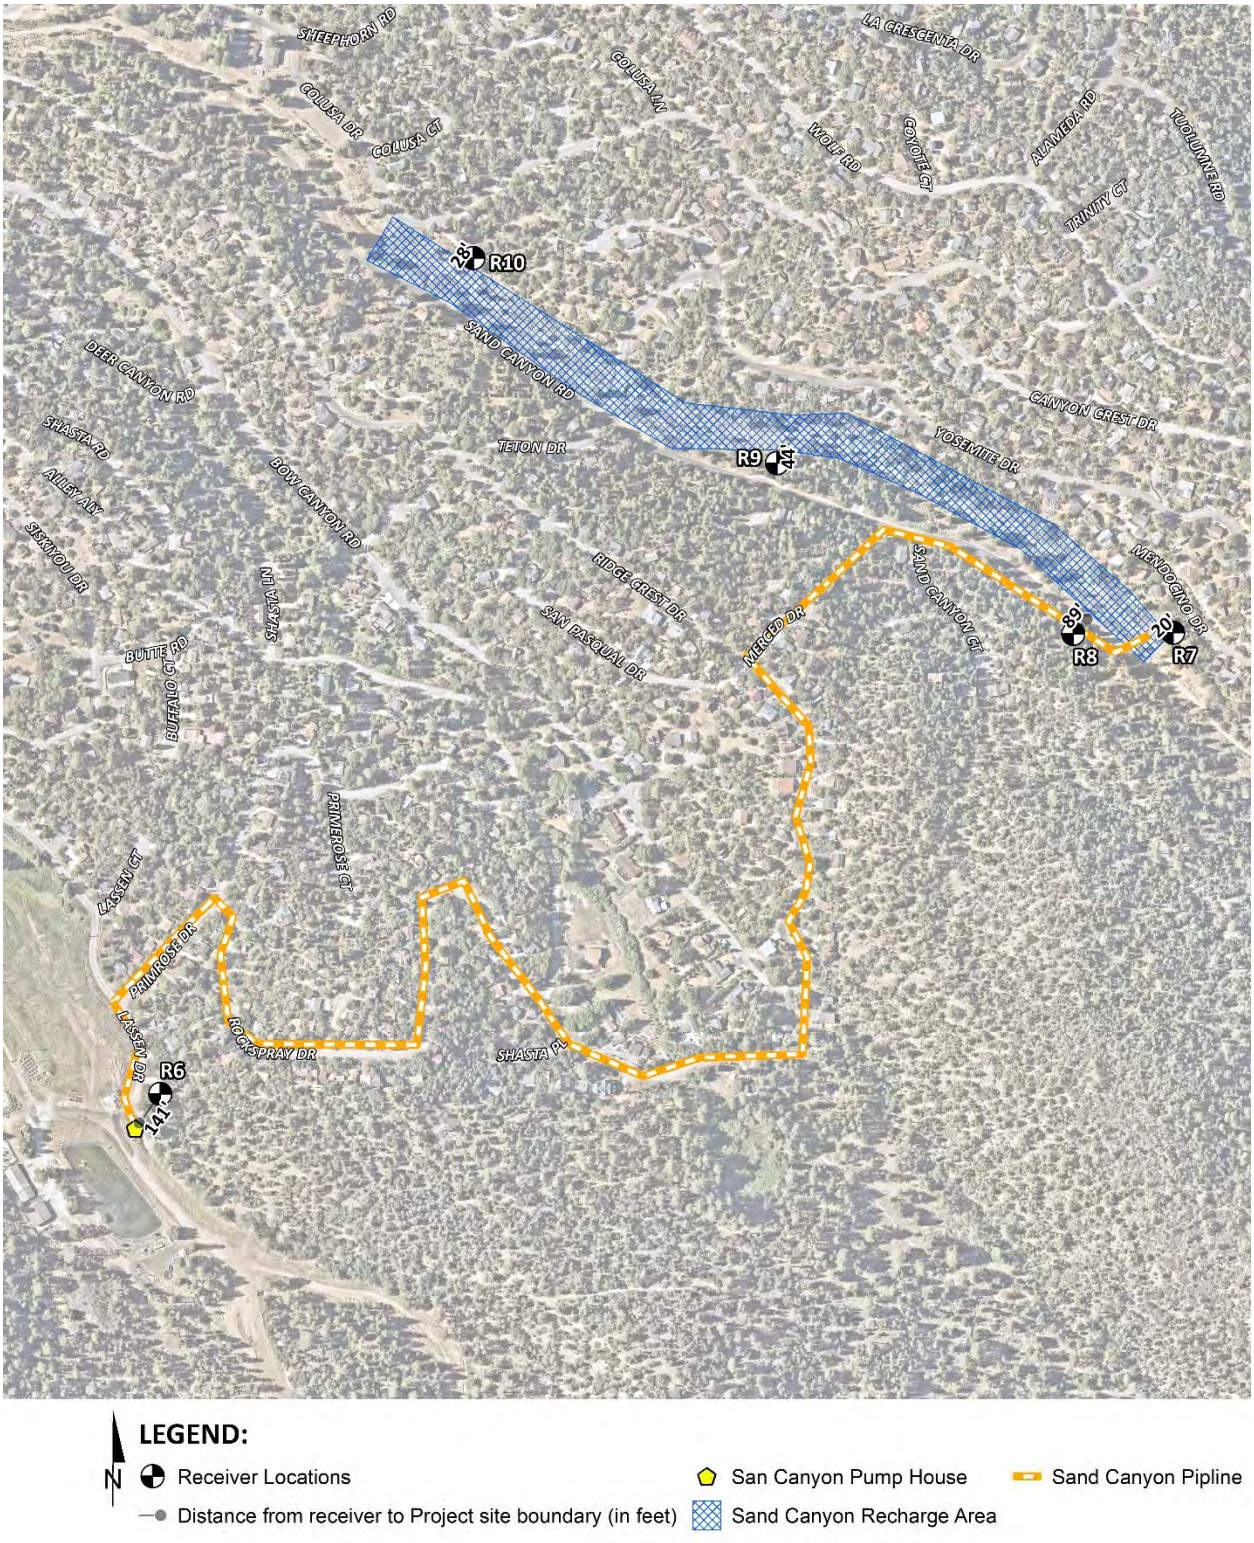

TABLE 8-1: CONSTRUCTION REFERENCE NOISE LEVELS

Construction Stage	Reference Construction Equipmnet[1]	Reference Noise Level @ 50 Feet (dBA L_{eq})	Composite Reference Noise Level (dBA L_{eq})	Reference Power Level (dBA L_w)
Demolition	Concrete Saw	83	86.3	118.0
	Impact Hammer (hoe ram)	83		
	Front End Loader	75		
Site Preparation	Tractor	80	84.0	115.6
	Backhoe	74		
	Grader	81		
Grading	Scraper	80	83.3	114.9
	Excavator	77		
	Dozer	78		
Building Construction	Crane	73	80.6	112.2
	Generator	78		
	Front End Loader	75		
Paving	Paver	74	77.8	109.5
	Dump Truck	72		
	Roller	73		
Architectural Coating	Man Lift	68	76.2	107.8
	Compressor (air)	74		
	Generator (<25kVA)	70		
Pipeline Construction	Excavator	77	79.6	111.3
	Front End Loader	75		
	Welder/Torch	70		
Monitoring Well Drilling	Auger Drill Rig	77	81.6	113.3
	Generator	78		
	Front End Loader	75		

[1] FHWA Road Construction Noise Model.

Noise levels generated by heavy construction equipment can range from approximately 68 dBA to more than 80 dBA when measured at 50 feet. However, these noise levels diminish with distance from the construction site at a rate of 6 dBA per doubling of distance. For example, a noise level of 80 dBA measured at 50 feet from the noise source to the receiver would be reduced to 74 dBA at 100 feet from the source to the receiver and would be further reduced to 68 dBA at 200 feet from the source to the receiver. A default ground attenuation factor of 0.0 was used in the CadnaA noise prediction model to account for hard site conditions.

8.3 CONSTRUCTION NOISE LEVELS

Using the reference construction equipment noise levels and the CadnaA noise prediction model, calculations of the Project construction noise level impacts at the nearby sensitive receiver

locations were completed for the BBARWA WWTP and Evaporation Pond construction, the Shay Pond Pipeline construction and the pump station and monitoring well installation at Sand Canyon. All other pipeline activities were modeled based on 200 foot and 400 foot pipeline activities, but due to the distances associated with the pipelines and the number of receiver locations, noise levels are predicted at a common distance of 30 feet from these activities for the Lake Discharge and Sand Canyon pipelines. To assess a reasonable worst-case construction scenario and account for the dynamic nature of construction activities, the Project construction noise analysis models the equipment combination with the highest reference level as a moving point source within the construction area (Project site boundary or alignment). As shown on Table 8-2, the highest construction noise levels during the BBARWA WWTP and Evaporation Pond construction activities noise levels are expected to range from 60.5 to 63.5 dBA L_{eq} at the nearest receiver locations. Appendix 8.1 includes the detailed CadnaA construction noise model inputs. These noise levels would not exceed the applicable daytime noise level limit of 80 dBA L_{eq}. Therefore, no mitigation is required for daytime construction activities at the BBARWA WWTP and Evaporation Pond.

As shown on Table 8-3, the highest construction noise levels during the Shay Pond Conveyance Pipeline construction activities noise levels are expected to range from 62.6 to 68.3 dBA L_{eq} at the nearest receiver locations. Appendix 8.2 includes the detailed CadnaA construction noise model inputs. These noise levels would not exceed the applicable daytime noise level limit of 80 dBA L_{eq}. Therefore, no mitigation is required for daytime construction activities along the Shay Pond Conveyance Pipeline.

As shown on Table 8-4, simultaneous construction of the pipeline improvements, the Sand Canyon Pump station, and improvements at the recharge location, the highest construction noise levels are expected to be 65.5 to 72.8 dBA L_{eq} at the nearest receiver locations. Appendix 8.3 includes the detailed CadnaA construction noise model inputs. These noise levels would not exceed the applicable daytime noise level limit of 80 dBA L_{eq}. Therefore, no mitigation is required for daytime construction activities at the Sand Canyon pump station or recharge area.

As indicated pipeline construction would occur within 30 feet of noise sensitive residential receivers along the majority of the Lake Discharge Pipeline and Sand Canyon alignments, at 30 feet pipeline construction activity is estimated to generate noise levels up to 79.1 dBA L_{eq} for segments with paving and 75.6 dBA L_{eq} for the segments without paving. Appendix 8.4 includes the CadnaA construction noise model inputs. These noise levels would not exceed the applicable daytime noise level limit of 80 dBA L_{eq}. Therefore, no mitigation is required for daytime construction activities at the Sand Canyon recharge site.

-- Recharge area would not include any building or paving activities.
[1] Noise receiver locations are shown on Exhibit 8-D.
[2] CadnaA construction noise model inputs are included in Appendix 8.3.

MONITORING WELL DRILLING ACTIVITIES

The highest construction noise levels during the Evaporation Pond and Shay Pond monitoring well drilling activities noise levels are expected to exceed the daytime and nighttime noise level limit at the nearest receiver locations within 125 feet and 325 feet, respectively. Since the exact locations of these activities are unknown, and these activities would occur for 24 hours a day for up to two weeks, thus without mitigation these activities will exceed the applicable noise level limit during the nighttime if located within 325 feet of residences. This would be considered a significant impact. Therefore, mitigation is required for nighttime monitoring well drilling activities at the Sand Canyon recharge site.

N-1 Monitoring Well Drilling:

To comply with the nighttime noise level limit during the nighttime hours noise, noise barriers with a minimum height of 14 feet shall be erected surrounding the drilling rig monitoring well locations such that the pumps, compressors, and the drilling rig are completely shielded from nearby residential areas. An effective barrier requires a weight of at least 2 pounds per square foot of face area with no decorative cutouts, perforations, or line-of-sight openings between shielded areas and the source. Examples of temporary barrier material includes 5/8-inch plywood, 5/8-inch oriented-strand board, or sound blankets capable of providing a minimum sound transmission loss (STC) of 27 or a Noise Reduction Coefficient (NRC) of 0.85.

With implementation of the barrier noise levels would be reduced to a maximum noise level of 69 dBA L_{eq} at 50 feet. None of the potential monitoring well locations are located within 50 feet of residences. Therefore, with implementation of mitigation measure N-1, impacts would be less than significant.

8.4 CONSTRUCTION NOISE LEVEL COMPLIANCE

To evaluate whether the Project will generate potentially significant short-term noise levels at nearby receiver locations, a construction related daytime noise level limit of 80 dBA L_{eq}, a nighttime noise level limit of 70 dBA L_{eq} (FTA Transit Noise and Vibration Impact Assessment Manual, 2018). The construction noise analysis shows that with mitigation measure N-1, the nearby receiver locations will satisfy the daytime and nighttime significance thresholds during Project construction activities. Therefore, the noise impacts due to Project construction noise is considered *less than significant* at all receiver locations.

8.5 CONSTRUCTION VIBRATION ASSESSMENT

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods employed. Operation of construction equipment causes ground vibrations that spread through the ground and diminish in strength with distance. Ground vibration levels associated with various types of construction equipment are summarized on Table 8-5. Based on the representative vibration levels presented for various construction equipment types, it is possible to estimate the potential for human response (annoyance) and

building damage using the following vibration assessment methods defined by the Caltrans. To describe the vibration impacts Caltrans provides the following equation: $PPV_{equip} = PPV_{ref} \times (25/D)^{1.5}$

TABLE 8-5: VIBRATION SOURCE LEVELS FOR CONSTRUCTION EQUIPMENT

Equipment	PPV (in/sec) at 25 feet
Small bulldozer	0.003
Jackhammer	0.035
Loaded trucks	0.076
Large bulldozer/Caisson drilling	0.089

Federal Transit Administration, Transit Noise and Vibration Impact Assessment, September 2018, p. 184.

8.6 CONSTRUCTION VIBRATION LEVELS

Construction activity can result in varying degrees of ground vibration, depending on the equipment and methods used, distance to the affected structures and soil type. It is expected that ground-borne vibration from typical Project construction activities would cause only intermittent or transient, localized intrusion. The proposed Project's construction activities most likely to cause vibration impacts are:

- Heavy Construction Equipment: Although all heavy mobile construction equipment has the potential of causing at least some perceptible vibration while operating close to building, the vibration is usually short-term (transient) and is not of enough magnitude to cause building damage.
- Trucks: Trucks hauling building materials to construction sites can be sources of transient vibration intrusion if the haul routes pass through residential neighborhoods on streets with bumps or potholes. Repairing the bumps and potholes generally eliminates the problem.

To assess the Project construction vibration levels, this analysis describes both the transient vibration levels associated with typical construction equipment activities and the continuous vibration levels associated with the well drilling activities.

8.6.1 TYPICAL CONSTRUCTION ACTIVITY VIBRATION LEVELS

Table 8-6 presents the expected Project related typical construction activity vibration levels at each of the receiver locations. At distances ranging from 20 to 871 feet from Project construction activity, including well drilling, the continuous construction vibration velocity levels are estimated to range from less than 0.00 to 0.124 PPV (in/sec), as shown on Table 8-6. Based on the vibration standards outlined in Table 4-1, the typical Project construction vibration levels will satisfy the transient human annoyance and building damage thresholds. Therefore, the vibration impacts due to Project typical construction activities are considered *less than significant*.

TABLE 8-6: CONSTRUCTION EQUIPMENT VIBRATION LEVELS

Receiver Location[1]	Distance to Const. Activity (Feet)[2]	Typical Construction Vibration Levels PPV (in/sec)[3]					Thresholds PPV (in/sec)[4]	Thresholds Exceeded?[5]

§ 83.01.080. Noise.

Latest version.

This Section establishes standards concerning acceptable noise levels for both noise-sensitive land uses and for noise-generating land uses.

(a) *Noise Measurement.* Noise shall be measured:

(1) At the property line of the nearest site that is occupied by, and/or zoned or designated to allow the development of noise-sensitive land uses;

(2) With a sound level meter that meets the standards of the American National Standards Institute (ANSI § SI4 1979, Type 1 or Type 2);

(3) Using the "A" weighted sound pressure level scale in decibels (ref. pressure = 20 micronewtons per meter squared). The unit of measure shall be designated as dB(A).

(b) *Noise Impacted Areas.* Areas within the County shall be designated as "noise-impacted" if exposed to existing or projected future exterior noise levels from mobile or stationary sources exceeding the standards listed in Subdivision (d) (Noise Standards for Stationary Noise Sources) and Subdivision (e) (Noise Standards for Adjacent Mobile Noise Sources), below. New development of residential or other noise-sensitive land uses shall not be allowed in noise-impacted areas unless effective mitigation measures are incorporated into the project design to reduce noise levels to these standards. Noise-sensitive land uses shall include residential uses, schools, hospitals, nursing homes, religious institutions, libraries, and similar uses.

(c) *Noise Standards for Stationary Noise Sources.*

(1) *Noise Standards.* Table 83-2 (Noise Standards for Stationary Noise Sources) describes the noise standard for emanations from a stationary noise source, as it affects adjacent properties:

Table 83-2		
Noise Standards for Stationary Noise Sources		
Affected Land Uses (Receiving Noise)	7:00 a.m. - 10:00 p.m. Leq	10:00 p.m. - 7:
Residential	55 dB(A)	45

Professional Services	55 dB(A)	55
Other Commercial	60 dB(A)	60
Industrial	70 dB(A)	70

Leq = (Equivalent Energy Level). The sound level corresponding to a steady-state sound level co same total energy as a time-varying signal over a given sample period, typically one, eight or 24

dB(A) = (A-weighted Sound Pressure Level). The sound pressure level, in decibels, as measured level meter using the A-weighting filter network. The A-weighting filter de-emphasizes the very lo high frequency components of the sound, placing greater emphasis on those frequencies within range of the human ear.

Ldn = (Day-Night Noise Level). The average equivalent A-weighted sound level during a 24-hour by adding 10 decibels to the hourly noise levels measured during the night (from 10:00 p.m. to 7 this way Ldn takes into account the lower tolerance of people for noise during nighttime periods.

(2) *Noise Limit Categories.* No person shall operate or cause to be operated a source of sound at a location or allow the creation of noise on property owned, leased, occupied, or otherwise controlled by the person, which causes the noise level, when measured on another property, either incorporated or unincorporated, to exceed any one of the following:

(A) The noise standard for the receiving land use as specified in Subdivision (b) (Noise-Impacted Areas), above, for a cumulative period of more than 30 minutes in any hour.

(B) The noise standard plus five dB(A) for a cumulative period of more than 15 minutes in any hour.

(C) The noise standard plus ten dB(A) for a cumulative period of more than five minutes in any hour.

(D) The noise standard plus 15 dB(A) for a cumulative period of more than one minute in any hour.

(E) The noise standard plus 20 dB(A) for any period of time.

(d) *Noise Standards for Adjacent Mobile Noise Sources.* Noise from mobile sources may affect adjacent properties adversely. When it does, the noise shall be mitigated for any new development to a level that shall not exceed the standards described in the following Table 83-3 (Noise Standards for Adjacent Mobile Noise Sources).

Table 83-3

Noise Standards for Adjacent Mobile Noise Sources

Land Use		Ldn (or CNEL) dB(A)	
Categories	Uses	Interior (1)	Exteri
Residential	Single and multi-family, duplex, mobile homes		
Commercial	Hotel, motel, transient housing		
Commercial retail, bank, restaurant	50		
Office building, research and development,	45		

professional offices	
Amphitheater, concert hall, auditorium, movie theater	45
Institutional/Public	Hospital, nursing home, school classroom, religious institution, library
Open Space	Park
Notes:	
(1) The indoor environment shall exclude bathrooms, kitchens, toilets, closets and corridors.	
(2) The outdoor environment shall be limited to: · Hospital/office building patios · Hotel and motel recreation areas · Mobile home parks · Multi-family private patios or balconies · Park picnic areas · Private yard of single-family dwellings · School playgrounds	
(3) An exterior noise level of up to 65 dB(A) (or CNEL) shall be allowed provided exterior noise le been substantially mitigated through a reasonable application of the best available noise reductio and interior noise exposure does not exceed 45 dB(A) (or CNEL) with windows and doors closed that windows and doors remain closed to achieve an acceptable interior noise level shall necess of air conditioning or mechanical ventilation.	
CNEL = (Community Noise Equivalent Level). The average equivalent A-weighted so during a 24-hour day, obtained after addition of approximately five decibels to sound evening from 7:00 p.m. to 10:00 p.m. and ten decibels to sound levels in the night fro p.m. to 7:00 a.m.	

(e) *Increases in Allowable Noise Levels.* If the measured ambient level exceeds any of the first four noise limit categories in Subdivision (d)(2), above, the allowable noise exposure standard shall be increased to reflect the ambient noise level. If the ambient noise level exceeds the fifth noise limit category in Subdivision (d)(2), above, the maximum allowable noise level under this category shall be increased to reflect the maximum ambient noise level.

(f) *Reductions in Allowable Noise Levels.* If the alleged offense consists entirely of impact noise or simple tone noise, each of the noise levels in Table 83-2 (Noise Standards for Stationary Noise Sources) shall be reduced by five dB(A).

(g) *Exempt Noise.* The following sources of noise shall be exempt from the regulations of this Section:

(1) Motor vehicles not under the control of the commercial or industrial use.

(2) Emergency equipment, vehicles, and devices.

(3) Temporary construction, maintenance, repair, or demolition activities between 7:00 a.m. and 7:00 p.m., except Sundays and Federal holidays.

(h) *Noise Standards for Other Structures.* All other structures shall be sound attenuated against the combined input of all present and projected exterior noise to not exceed the criteria.

Table 83-4	
Noise Standards for Other Structures	
Typical Uses	12-Hour Equivalent Sound Leve dBA Ldn
Educational, institutions, libraries, meeting facilities, etc.	45
General office, reception, etc.	50
Retail stores, restaurants, etc.	55
Other areas for manufacturing, assembly, testing, warehousing, etc.	65

In addition, the average of the maximum levels on the loudest of intrusive sounds occurring during a 24-hour period shall not exceed 65 dBA interior.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
COLORADO RIVER BASIN REGION

ORDER R7-2021-0023

WASTE DISCHARGE REQUIREMENTS
FOR
BIG BEAR AREA REGIONAL WASTEWATER AGENCY, OWNER/OPERATOR
EXPORT OF RECYCLED WATER TO LUCERNE VALLEY
LUCERNE VALLEY-SAN BERNARDINO COUNTY

The California Regional Water Quality Control Board, Colorado River Basin Region (Regional Water Board) hereby makes the following Findings:

1. Big Bear Area Regional Wastewater Agency (BBARWA or Discharger), P.O. Box 517, Big Bear City, California 92314, owns 480 acres in the Lucerne Valley, of which 340 acres are irrigated with recycled water from the Discharger's Wastewater Treatment Plant (WWTP). There are an additional 140 acres available for irrigation, also in the Lucerne Valley. BBARWA's WWTP provides sewerage service to the City of Big Bear Lake, Big Bear City Community Services District, and County Service Area 53-B. The WWTP is located at 122 Palomino Drive, Big Bear City, California 92314, and has a design treatment capacity of 4.89 million gallons-per-day (MGD) and a hydraulic capacity of 9.2 MGD. The Facility is assigned California Integrated Water Quality System (CIWQS) number CW-208930, Waste Discharge Identification (WDID) number 7A360100011, and GeoTracker Global Identification number WDR100027897.

2. The WWTP is located outside the boundary of the Colorado River Basin Water Board (Regional Water Board) and is regulated by the California Regional Water Quality Control Board, Santa Ana Region (Santa Ana Water Board) under Waste Discharge Requirements (WDRs) Order R8-2005-0044.

3. The WWTP has the following types of treatment: preliminary treatment, secondary treatment, and sludge drying and treatment. Secondary treated wastewater from the WWTP is disposed of through three possible discharge points that are designated in Order R8-2005-0044 as Point 001, Point 002, and Point 003. The discharges from the WWTP at Points 002 and 003 are regulated by the Santa Ana Regional Water Quality Control Board. The majority of the treated wastewater is discharged through Discharge Point 001 into the Lucerne Valley to irrigate fodder, fiber, and seed crops. A minimal volume of treated wastewater is discharged through Points 002 and 003 for recycling and reuse at various sites for irrigation, dust control at construction sites, and wildlife habitat restoration in the Baldwin Lake.

4. This Order regulates the discharge from the WWTP at Point 001. Infrastructure associated with this discharge includes a concrete-lined reservoir and two overflow

ponds that are used to dispose of treated recycled wastewater by percolation and evaporation in the Lucerne Valley (Lucerne Valley Facility or Facility).

5. The Lucerne Valley Facility is located near the intersection of State Highway 247 (Old Woman Springs Road) and Camp Rock Road in the Lucerne Valley of San Bernardino County in Section 14, T4N, R1E, SBB&M, and Assessor's Parcel Number (APN) 0449-082-040000, 34.438554°N Latitude, -116.851225°W Longitude. The Facility's location is shown in **Attachment A**- Vicinity Map, made part of this Order by reference.

6. The Lucerne Valley Facility was most recently regulated by WDRs in Order R7-2016-0026, which was adopted by the Regional Water Board on June 30, 2016.

7. On October 28, 2020, the Discharger submitted an application and Report of Waste Discharge (ROWD) to the Regional Water Board, applying for updated WDRs for the Facility.

8. This Order updates the WDRs to comply with current laws and regulations applicable to the discharge. Accordingly, this Order supersedes WDRs in Order R7-2016-0026 upon the effective date of this Order, except for enforcement purposes.

Wastewater Treatment Facility and Discharge

9. Wastewater that is discharged at the Lucerne Valley Facility goes through preliminary and secondary treatment at the WWTP before it is sent via gravity to the concrete reservoir at the Lucerne Valley Facility. The WWTP components that are used for treatment are described below and the Process Flow Diagram for the WWTP is shown in **Attachment B**–Process Flow Diagram.

    a. **Preliminary Treatment**. Untreated wastewater flows to the preliminary treatment system, which consists of bar screens, aerated grit chamber with grit washer, and a flow bypass channel. This treatment stage removes screenings, rag material, and grit.

    b. **Secondary Treatment**. Effluent flows by gravity from the preliminary treatment system to three parallel oxidation ditches for secondary (biological) treatment and timed processes for nutrient (nitrogen) removal. The number of ditches in operation depends on the seasonal fluctuations of the influent flow. The effluent from the oxidation ditches flows into a system of three secondary clarifiers for removal of floatable and settleable solids/materials. The secondary treated effluent flows to two cement-lined balancing chambers and then flows to equalization storage ponds at the WWTP until pumped for offsite irrigation disposal.

    c. **Offsite Irrigation/Disposal**. Undisinfected secondary treated wastewater is pumped from the WWTP's main pump building (5.2 MGD) or auxiliary

pump building (9.2 MGD) approximately 16.5 miles to an offsite 2.26-million-gallon, concrete-lined reservoir (undisinfected secondary recycled water reservoir). This reservoir is located one mile south of the irrigation site. Wastewater from the reservoir flows by gravity through an outfall line connected to the irrigation system. In the event of an overflow at the concrete-lined reservoir, the wastewater flows by gravity to earthen overflow ponds located adjacent to the irrigation site.

10. Approximately 2.12 MGD of undisinfected secondary recycled water (as defined in California Code of Regulations, title 22, section 60301.900) is discharged to the Lucerne Valley Facility for irrigation of fodder and fiber crops. Undisinfected secondary wastewater was approved by the California Department of Public Health (succeeded by the State Water Resources Control Board's [State Water Board] Division of Drinking Water) for irrigation use at this site. Approximately 340 acres are currently irrigated at the Lucerne Valley Facility, with an additional 140 acres available for irrigation at the site. The effluent discharge limit of 4.8 MGD in this Order is based on the capacity of the irrigated crops to take up nitrogen. The Lucerne Valley Facility site layout is shown in **Attachment C**, made part of this Order by reference.

11. The State Water Board's Division of Drinking Water has established statewide reclamation criteria in California Code of Regulations, title 22, section 60301 et seq. for the use of recycled water and developed guidelines for specific uses. Section 60304(d)(4) allows the use of undisinfected, secondary recycled water for the surface irrigation of fodder and fiber crops and pasture for animals not producing milk for human consumption. BBARWA's Title 22 Engineering Report was initially approved on November 3, 1980 and was last updated November 4, 1998, to allow for the use of tertiary treated wastewater in the Big Bear Area.

12. The grazing of sheep on the irrigation site has been allowed under certain conditions, as outlined in a letter from Regional Water Board staff dated November 15, 1994, and in Discharge Specification D.18 of this Order.

13. No sewage sludge is discharged at the recycled water reuse site.

14. BBARWA's Self-Monitoring Reports (SMRs) from January 2016 through December 2020 characterize the WWTP effluent as follows:

Table 1. Effluent Characterization

Constituent	Units	Average	Maximum	Minimum
Flow	MGD	2.12	8.39	0.441

Constituent	Units	Average	Maximum	Minimum
20° C BOD_5[1]	mg/L[2]	8	36	ND[3]
TSS[4]	mg/L	8	44	1
pH	s.u.[5]	7.61	8.46	6.85
Total Dissolved Solids (TDS)	mg/L	441	520	350
Total Inorganic Nitrogen (TIN)[6]	mg/L	3.9	22.3	0.4
Total Nitrogen (TN)	mg/L	4.9	12	1.8
Nitrate as N	mg/L	1.7	7.7	0.04
Chloride	mg/L	56	87	34
Sulfate	mg/L	40	48	29
Fluoride	mg/L	0.43	0.61	0.24
Boron	mg/L	0.20	0.32	<0.1

Hydrogeologic Conditions

15. Lucerne Valley Groundwater Basin underlies Lucerne and North Lucerne Valleys and is bounded on the south by the San Bernardino Mountains and on the west by the Granite Mountains and the Helendale fault. The Ord Mountains bound the basin on the north. The Camp Rock fault and Kane Wash Area Groundwater Basin bound this basin on the east and the Fry Mountains bound this basin on the southeast. Parts of the eastern and southeastern boundaries are surface drainage

[1] 5-day biochemical oxygen demand at 20 degrees Celsius.

[2] Milligrams per Liter

[3] Not Detected at the laboratory's Reporting Limit.

[4] Total Suspended Solids

[5] Standard pH units

[6] Total Inorganic Nitrogen is the sum of nitrate, nitrite, and total ammonia.

divides. Surface water drains toward Lucerne (dry) Lake in the western portion of the basin, which has an altitude of 2,850 feet above sea level (Schaefer 1979[7]).

16. The principal water-bearing deposits are Quaternary age alluvium, and dune sand. The deposits are unconsolidated or semi-consolidated and the alluvium is composed of gravel, sand, silt, clay, and occasional boulders. Where saturated, the alluvium yields water freely to wells. The average specific yield for these deposits is 11 percent. Irrigation wells in the basin yield as much as 1,000 gallons per minute (Schaefer 1979).

17. BBARWA has three groundwater monitoring wells (MW-1-upgradient; MW-2-downgradient; and MW-3-downgradient). Groundwater levels in monitoring wells have increased since the wells were constructed in 1991. BBARWA has reported that the depth to groundwater at the Lucerne Valley Facility is within the range of 125 to 175 feet below ground surface (bgs) and groundwater flow direction is generally to the northwest, towards Lucerne Dry Lake.

18. Groundwater monitoring data collected from monitoring wells MW-1, MW-2, and MW-3 during the period from 2017 through 2020 show the following average characteristics:

Table 2. Groundwater Monitoring Data

Constituent	Units	MW-1	MW-2	MW-3
Depth to Groundwater	ft	170	125.2	138.1
TDS	mg/L	435.5	655.2	583
TN	mg/L	9.54	15.1	15.9
Nitrate as N	mg/L	8.97	14.5	15.4
Sulfate	mg/L	62.1	138.4	179.7
Chloride	mg/L	70.3	123.4	109.1
Fluoride	mg/L	0.19	0.14	0.24
Boron	mg/L	0.12	0.11	0.09
VOCs	ug/L	ND	ND	ND

[7] Schaefer, D.H. 1979. *Ground-Water Conditions and Potential for Artificial Recharge in Lucerne Valley, San Bernardino County, California*. U.S. Geological Survey Water Resources Investigations 78-118. 37 p.

19. Annual precipitation in the Lucerne Valley region averages about 14 inches.

20. Typically, November through April are considered wet weather, while May through October are considered dry weather months.

21. There are several domestic wells in the vicinity of the irrigation recycled use area and the evaporation/percolation ponds.

22. Water supply to the Big Bear area communities is from numerous groundwater production wells located in Big Bear Valley. TDS in the water supply averages about 280 mg/L based on data reported in the BBARWA's SMRs from 2017 through 2020.

23. BBARWA conducted a geotechnical study referenced as *Geotechnical Study, Irrigation Site, Lucerne Valley Area, San Bernardino County, California for Big Bear Area Regional Wastewater Agency, July 29, 1977,* as an initial investigation of the site for use for irrigation. The report shows that the site is underlain by soils consisting of fine to coarse, clean to silty sands containing various amounts of gravel from 5 to 24 feet below ground surface. Beneath this, to a depth of 60 to 100 feet below ground surface, the soil consists of fine to medium silty sands containing varying amounts of gravel and is locally cemented with calcium carbonate accumulated during deposition of the sediments. Bedrock underlies the older alluvium at a depth of 400 to 600 feet.

Basin Plan, Beneficial Uses, and Regulatory Considerations

24. The Water Quality Control Plan for the Colorado River Basin Region (Basin Plan), adopted on November 17, 1993 and most recently amended on January 8, 2019, designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. Pursuant to Water Code section 13263, subdivision (a), WDRs must implement the Basin Plan and take into consideration the beneficial uses to be protected, the water quality objectives reasonably required for that purpose, other waste discharges, the need to prevent nuisance, and the provisions of Water Code section 13241.

25. The Facility is located within the Lucerne Hydrologic Unit, and the Basin Plan designates the following beneficial uses for groundwater:

    a. Municipal Supply (MUN),
    b. Industrial Supply (IND), and
    c. Agricultural Supply (AGR).

26. This Order establishes WDRs pursuant to division 7, chapter 4, article 4 of the Water Code for discharges that are not subject to regulation under Clean Water Act section 402 (33 U.S.C. § 1342).

27. These WDRs implement numeric and narrative water quality objectives for groundwater and surface waters established by the Basin Plan and other applicable state and federal laws and policies. The numeric objectives for groundwater designated for municipal and domestic supply include the maximum contaminant levels (MCLs) specified in California Code of Regulations, title 22, section 64421 et seq. Groundwater for use as domestic or municipal water supply (MUN) must not contain taste- or odor-producing substances in concentrations that adversely affect beneficial uses as a result of human activity.

28. It is the policy of the State of California that every human being has the right to safe, clean, affordable, and accessible water adequate for human consumption, cooking, and sanitary purposes. This Order promotes that policy by requiring discharges to meet MCLs designed to protect human health and ensure that water is safe for domestic use.

29. The discharge authorized by this Order, except for discharges of residual sludge and solid waste, are exempt from the solid waste requirements of California Code of Regulations, title 27, section 20005 et seq. This exemption is based on section 20090, subdivisions (a) and (b) of title 27 of the California Code of Regulations, which provides that discharges of domestic sewage or wastewater to land, including but not limited to evaporation ponds, percolation ponds, or subsurface leach fields are not subject to the requirements of title 27 if the following exemption conditions are met:

    a. The applicable regional water board has issued WDRs, reclamation requirements, or waived such issuance;

    b. The discharge is in compliance with the applicable water quality control plan; and

    c. The wastewater does not need to be managed according to chapter 11, division 4.5, title 22 of the California Code of Regulations as a “hazardous waste.”

30. The discharge of waste authorized by these WDRs satisfies the conditions to be exempted from the requirements of title 27 of the California Code of Regulations, because (1) the discharge is regulated by these WDRs; (2) these WDRs will ensure the discharge complies with the Basin Plan; and (3) the discharge will not be of a “hazardous waste.”

31. Consistent with Water Code section 13241, the Regional Water Board, in establishing the requirements contained herein, considered factors including, but not limited to, the following:

a. Past, present, and probable future beneficial uses of water;

b. Environmental characteristics of the hydrographic unit under consideration, including the quality of water available thereto;

c. Water quality conditions that could reasonably be achieved through the coordinated control of all factors which affect water quality in the area;

d. Economic considerations;

e. The need for developing housing within the region(s); and

f. The need to develop and use recycled water.

32. Water Code section 13267 authorizes the Regional Water Board to require technical and monitoring reports. The monitoring and reporting requirements in Monitoring and Reporting Program (MRP) R7-2021-0023 are necessary to demonstrate compliance with this Order. The State Water Resources Control Board's (State Water Board's) electronic database, GeoTracker Information Systems, facilitates the submittal and review of monitoring and reporting documents. The burden, including costs, of the MRP bears a reasonable relationship to the need for that information and the benefits to be obtained from that information.

33. Pursuant to Water Code section 13263, subdivision (g), the discharge of waste is a privilege, not a right, and adoption of this Order does not create a vested right to continue the discharge.

Antidegradation Analysis

34. State Water Board Resolution 68-16, entitled *Statement of Policy with Respect to Maintaining High Quality Waters in California* (Resolution 68-16), generally prohibits the Regional Water Board from authorizing discharges that will result in the degradation of high quality waters, unless it is demonstrated that any change in water quality will (a) be consistent with maximum benefit to the people of the state, (b) not unreasonably affect beneficial uses, and (c) not result in water quality less than that prescribed in state and regional policies (e.g., the violation of one or more water quality objectives). The discharger must also employ best practicable treatment or control (BPTC) to minimize the degradation of high quality waters. High quality waters are surface waters or areas of groundwater that have a baseline water quality better than required by water quality control plans and policies.

35. Some degradation of groundwater from the discharge to the irrigation recycled use area and the infiltration basins is consistent with Resolution 68-16, provided that the degradation:

a. Is confined to a reasonable area;

b. Is minimized by means of full implementation, regular maintenance, and optimal operation of BPTC measures by the Discharger;

c. Is limited to waste constituents typically encountered in domestic wastewater;

d. Does not unreasonably affect any beneficial uses of groundwater prescribed in the Basin Plan, and will not result in the violation of any water quality objective; and

e. Is consistent with the maximum benefit to the people of the state.

36. Recycled water used for irrigation at the Lucerne Valley Facility is treated to secondary standards and has undergone substantial removal of soluble organic matter, solids, and nitrogen treatment. Constituents in the wastewater effluent that have the potential to degrade groundwater include nitrogen, chloride, sulfate, TDS, and total coliform. Each of these constituents is discussed below:

a. **Nitrogen.** The Primary Maximum Contaminant Level (MCL) found in California Code of Regulations, title 22, section 64431 for nitrate plus nitrite as nitrogen is 10 mg/L. To account for the fate of transport for the various components of total nitrogen, as a conservative value, it is assumed that all nitrogen present converts to nitrate/nitrite. BBARWA's SMRs report an average of 3.9 mg/L for Total Inorganic Nitrogen and 4.9 mg/L for Total Nitrogen between January 2016 and December 2020. BBARWA conducted a study of the groundwater in the vicinity of the recycled water irrigation use site in September 2016 which included an analysis of potential sources of nitrate in the groundwater other than BBARWA recycled water. Some of the sources included onsite farming practices, irrigation and fertilization in excess of plant demands, and potential upgradient sources, such as discharges from individual onsite septic systems. The study found that nitrate concentrations have been increasing in the upgradient groundwater monitoring well but have been decreasing in the downgradient monitoring wells. To verify no degradation due to nitrogen is occurring, this Order requires quarterly total nitrogen and nitrate as nitrogen monitoring in the groundwater monitoring wells. This Order also provides an average monthly effluent limit for total nitrogen of 10 mg/L.

b. **Chloride and Sulfate**. The "recommended" Secondary MCLs in California Code of Regulations, title 22, section 64449 for chloride and sulfate are both 250 mg/L. Concentrations of chloride and sulfate are included in TDS measurements. BBARWA's SMRs report an average of 56 and 40 mg/L for chloride and sulfate, respectively, between January 2016 and December 2020. Additionally, BBARWA's SMRs, for the same time period, report a maximum of 87 and 48 mg/L for chloride and sulfate, respectively.

BBARWA occasionally experience increases in chloride due to the use of salt and brine on local roadways prior to snowstorm events. To evaluate the incremental degradation due to chloride and sulfate, this Order requires quarterly chloride and sulfate monitoring in the groundwater monitoring wells. This Order also provides an average monthly effluent limit of 60 mg/L and a daily maximum effluent limit of 80 mg/L for both chloride and sulfate.

c. **TDS.** The Secondary MCL specified in California Code of Regulations, title 22, section 64449 for TDS ranges between the "recommended" consumer acceptance level of 500 mg/L and the "upper" consumer acceptance level of 1,000 mg/L, if it is neither reasonable nor feasible to provide more suitable waters. The typical incremental addition of dissolved salts from domestic water usage in wastewater treatment plants ranges from 150 to 380 mg/L. Domestic water supply to the Big Bear area communities showed an average concentration of about 280 mg/L based on data reported in the BBARWA's SMRs from 2017 through 2020. From 2016 to December 2020, treated wastewater discharged had an average TDS concentration of approximately 440 mg/L. Thus, the average TDS increase over the domestic water supply in the discharge was about 160 mg/L. Based on the study that the Discharger conducted in September 2016, which analyzed the impacts of groundwater by the discharge, the results would help establish an appropriate effluent limitation for TDS. The study states that the average TDS concentration in the Lucerne Valley Groundwater Basin is closer to 500 mg/L in the vicinity of the discharge location, whereas the Basin as a whole has an average of approximately 1,100 mg/L. Downgradient TDS concentrations in groundwater were found to be equal to or above concentrations of water delivered to the discharge location and the basin-wide average TDS concentration is above that of the delivered water. Therefore, the delivered water is not expected to degrade the existing groundwater quality or limit existing downgradient beneficial uses. To verify there is no degradation due to TDS is occurring, this Order includes quarterly TDS monitoring in the groundwater monitoring wells. This Order also provides an effluent limit for TDS of 550 mg/L over a 12-month period.

d. **Total Coliform.** Secondary treatment reduces fecal coliform densities by 90 to 99%; the remaining organisms in effluent are still 10^5 to 10^6 most probable number (MPN)/100 mL (U.S. Environmental Protection Agency, *Design Manual: Municipal Wastewater Disinfection*, EPA/625/1-86/021, October 1986.) Other sources of *E. Coli* may include residential septic systems and runoff from animal waste, which are both present in the areas surrounding the groundwater monitoring wells. Given the depth to groundwater, which is approximately 125 to 175 feet, it is not likely that pathogen-indicator bacteria will reach groundwater in excess of that prescribed in California Code of Regulations, title 22, section 64426.1, due to significant attenuation and removal in the soils in the vadose zone. To evaluate the potential degradation to groundwater due to pathogens, this

Order includes quarterly *E. coli* monitoring in the groundwater monitoring wells and monthly *E. coli* monitoring in the effluent.

37. The discharge of wastewater from the Facility, as permitted herein, reflects BPTC. The Facility incorporates:

    a. Technology for secondary treated domestic wastewater;

    b. Structural controls to dispose of waste constituents in a designated area;

    c. A network of groundwater monitoring wells;

    d. An operation and maintenance manual;

    e. An Irrigation Management Plan;

    f. Staffing to ensure proper operation and maintenance; and

    g. A standby emergency power generator of sufficient size to operate the treatment plant and ancillary equipment during periods of loss of commercial power.

38. Degradation of groundwater by some of the typical waste constituents associated with discharges from a facility treating domestic wastewater, after effective source control, treatment, and control measures are implemented, is consistent with the maximum benefit to the people of the state. The technology, energy, water recycling, and waste management advantages of regional utility service far exceed any benefits derived from reliance on numerous, concentrated individual wastewater systems, and the impact on water quality will be substantially less. These factors, when taken in conjunction with the associated increase in waste constituents, are consistent with the maximum benefit to the people of the state. Accordingly, the discharge, as authorized, is consistent with the antidegradation provisions of Resolution 68-16 and applicable water quality objectives.

Stormwater

39. Federal regulations for stormwater discharges were promulgated by the U.S. Environmental Protection Agency on November 16, 1990 (40 C.F.R. parts 122, 123, and 124) to implement the Clean Water Act's stormwater program set forth in Clean Water Act section 402, subdivision (p) (33 U.S.C. § 1342(p)). In relevant part, the regulations require specific categories of facilities that discharge stormwater associated with industrial activity to "waters of the United States" to obtain National Pollutant Discharge Elimination System (NPDES) permits and to require control of such pollutant discharges using Best Available Technology Economically Achievable (BAT) and Best Conventional Pollutant Control Technology (BCT) to prevent and reduce pollutants and any more stringent controls necessary to meet water quality standards.

40. The State Water Board adopted Order 2014-0057-DWQ (NPDES No. CAS000001), *General Permit for Storm Water Discharges Associated with Industrial Activities* (Industrial General Permit) on July 1, 2015. Facilities used in the storage, treatment, recycling, and reclamation of municipal or domestic sewage with a design flow of one million gallons per day or more, or that are required to have an approved pretreatment program under 40 Code of Federal Regulations part 403, are required to enroll under the Industrial General Permit, unless there is no discharge of industrial stormwater to waters of the United States.

CEQA and Public Participation

41. Pursuant to California Code of Regulations, title 14, section 15301, the issuance of these WDRs, which govern the operation of an existing facility involving negligible or no expansion of use beyond that previously existing, is exempt from the provisions of the California Environmental Quality Act (CEQA), Public Resources Code section 21000 et seq.

42. The Regional Water Board has notified the Discharger and all known interested agencies and persons of its intent to issue WDRs for this discharge, and has provided them with an opportunity for a public meeting and to submit comments.

43. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to this discharge.

IT IS HEREBY ORDERED that Order R7-2016-0026 is rescinded upon the effective date of this Order, except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the Water Code, and regulations adopted thereunder, the Discharger shall comply with the following:

A. Effluent Limitations

1. Effluent used for irrigation in the recycled use area or discharged into the overflow evaporation/percolation ponds for disposal shall not exceed the following effluent limits:

Table 3. Effluent Limitations

Constituent	Units	Monthly Average	Weekly Average	Daily Maximum
20°C BOD_5	mg/L	30	45	--
Total Suspended Solids	mg/L	30	45	--
Chloride	mg/L	60	--	80

Constituent	Units	Monthly Average	Weekly Average	Daily Maximum
Sulfate	mg/L	60	--	80
Boron	mg/L	--	--	0.75
Total Nitrogen	mg/L	10	--	--

2. The 30-day average daily dry weather discharge for irrigation shall not exceed 4.8 MGD.

3. The hydrogen ion concentration (pH) in the effluent discharge for irrigation shall be maintained within the limits of 6.0 to 9.0 standard units.

4. The TDS concentration of the effluent shall not exceed a 12-month average effluent limit of 550 mg/L. The reported concentration shall be determined by the arithmetic mean of the last twelve months of monitoring.

5. The overflow evaporation/percolation ponds shall be maintained so that they continuously operate in aerobic conditions. The dissolved oxygen content in the upper zone (one foot) of the infiltration basins shall be equal to or greater than 1.0 mg/L.

B. Receiving Water Limitations

1. The discharge of wastewater from the Facility shall not cause groundwater to: exceed applicable water quality objectives; acquire taste, odor, toxicity, or color that create nuisance conditions; impair beneficial uses; or contain constituents in excess of California Maximum Contaminant Levels (MCLs), as set forth in title 22 of the California Code of Regulations (including, but not limited to, section 64426.1 for bacteriological constituents; section 64431 for inorganic chemicals; section 64444 for organic chemicals; and section 64678 for lead and copper).

C. Discharge Prohibitions

1. Discharge of waste classified as “hazardous,” as defined in California Code of Regulations, title 27, section 20164, or “designated,” as defined in Water Code section 13173 and California Code of Regulations, title 27, section 20164, is prohibited.

2. The discharge of treated wastewater at a location other than the designated disposal areas or as recycled water used for irrigation at approved use areas, is prohibited.

3. The discharge of wastewater and/or recycled water to surface waters or surface drainage courses is prohibited.

4. The Discharger shall not accept waste in excess of the design treatment capacity of the Facility's disposal system.

5. Surfacing or ponding of wastewater outside of the designated disposal locations is prohibited.

6. Application of treated wastewater for irrigation in excess of agronomic rates is prohibited.

7. Bypass or overflow of untreated or partially-treated waste is prohibited, except as permitted in Standard Provision E.13.

8. The discharge of wastewater to a location or in a manner different from that described in this Order is prohibited.

9. The discharge of wastewater to land not owned or controlled by the Discharger, or not authorized for such use, is prohibited.

10. The storage, treatment, or disposal of wastes from the Facility shall not cause contamination, pollution, or nuisance as defined in Water Code section 13050, subdivisions (k), (l), and (m).

D. Discharge Specifications

1. The Discharger shall maintain sufficient freeboard in the overflow evaporation/percolation ponds to accommodate seasonal precipitation and to contain a 100-year storm event, but in no case no less than two (2) feet of freeboard (measured vertically). Freeboard shall be utilized for wake and waves of fluid motion and emergency or natural disaster purposes only.

2. All treatment, storage, and disposal areas shall be designed, constructed, operated and maintained to prevent inundation or washout due to floods with a 100-year return frequency.

3. Evaporation/percolation ponds shall have sufficient capacity to accommodate allowable wastewater flow, design seasonal precipitation, ancillary inflow, and infiltration. Design seasonal precipitation shall be based on total annual precipitation using a return period of 100 years, distributed monthly in accordance with historical rainfall patterns.

4. The evaporation/percolation ponds shall be managed to prevent breeding of mosquitoes. In particular:

a. An erosion control program should ensure that small coves and irregularities are not created around the perimeter of the water surface.

b. Weeds shall be minimized through control of water depth, harvesting, or herbicides.

c. Dead algae, vegetation, and debris shall not accumulate on the water surface.

5. Public contact with wastewater shall be precluded through such means as fences, signs, or other acceptable alternatives.

6. Objectionable odors originating at the Facility shall not be perceivable beyond the property boundary.

7. The evaporation/percolation ponds shall be maintained and operated so as to maximize infiltration and minimize the increase of salinity in the groundwater.

8. Onsite wastes, including windblown spray from recycled water application, shall be strictly confined to the lands specifically designated for the disposal operation, and onsite irrigation practices shall be managed so there is no runoff of effluent from irrigated areas.

9. No irrigation with, or impoundment of, undisinfected secondary recycled water shall take place within 150 feet of any domestic water supply well.

10. No spray irrigation of any recycled water shall take place within 100 feet of a residence or a place where public exposure could be similar to that of a park, playground or schoolyard.

11. Except as allowed under California Code of Regulations, title 17, section 7604, no physical connection shall be made or allowed to exist between any recycled water system and any separate system conveying potable water.

12. Undisinfected secondary recycled water, as defined in California Code of Regulations, title 22, section 60301.900, may only be used for irrigation in the following applications:

a. Orchards where the recycled water does not come into contact with the edible portion of the crop;

b. Vineyards where the recycled water does not come into contact with the edible portion of the crop;

c. Non-food bearing trees (Christmas tree farms are included in this category provided no irrigation with recycled water occurs for a period of 14 days prior to harvesting or allowing access by the general public);

d. Fodder and fiber crops and pasture for animal not producing milk for human consumption;

e. Seed crops not eaten by humans;

f. Food crops that must undergo commercial pathogen-destroying processing before being consumed by humans; and

g. Ornamental nursery stock and sod farms provided no irrigation with recycled water occurs for a period of 14 days prior to harvesting, retail sale, or allowing access by the general public.

13. No recycled water used for irrigation, or soil that has been irrigated with recycled water, shall come into contact with edible portions of food crops eaten raw by humans.

14. The delivery or use of recycled water shall conform with the reclamation criteria contained in California Code of Regulations, title 22 or amendments thereto, for the irrigation of food crops, irrigation of fodder, fiber, and seed crops, landscape irrigation, supply of recreational impoundments, and groundwater recharge.

15. Prior to delivering recycled water to any new user, the Discharger shall submit to the Regional Water Board a report discussing any new distribution system being constructed by the Discharger to provide service to the new user.

16. Recycled water shall not be delivered to any new user who has not first received a discharge permit from the Regional Water Board and approval from the State Water Board’s Division of Drinking Water.

17. Treated or untreated sludge or similar solid waste materials shall be disposed of at locations approved by the Regional Water Board’s Executive Officer.

18. Grazing of sheep on the irrigation site is allowed only under the following conditions, unless otherwise approved by the Regional Water Board 's Executive Officer:

a. Grazing will only be conducted in October or November after the last cutting of hay has been baled;

b. Grazing animals will not be allowed into a portion of the site until 10 days after it was last irrigated;

c. Temporary fences will be erected to contain the grazing animals in an area of 40 acres or less;

d. Only ewes that are about to lamb or ewes with newly born will be grazed;

e. No animals will be sold for slaughter within 90 days after grazing; and

f. No milk produced by sheep that have grazed at the irrigation site shall be used for human consumption.

E. Standard Provisions

1. **Noncompliance.** The Discharger shall comply with all of the terms, requirements, and conditions of this Order and MRP R7-2021-0023. Noncompliance is a violation of the Porter-Cologne Water Quality Control Act (Water Code, § 13000 et seq.) and grounds for: (1) an enforcement action; (2) termination, revocation and reissuance, or modification of these waste discharge requirements; or (3) denial of an Order renewal application.

2. **Enforcement.** The Regional Water Board reserves the right to take any enforcement action authorized by law. Accordingly, failure to timely comply with any provisions of this Order may subject the Discharger to enforcement action. Such actions include, but are not limited to, the assessment of administrative civil liability pursuant to Water Code sections 13323, 13268, and 13350, a Time Schedule Order (TSO) issued pursuant to Water Code section 13308, or referral to the California Attorney General for recovery of judicial civil liability.

3. **Proper Operation and Maintenance.** The Discharger shall at all times properly operate and maintain all systems and components of collection, treatment, and control installed or used by the Discharger to achieve compliance with this Order. Proper operation and maintenance includes, but is not limited to, effective performance, adequate process controls, and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities/systems when necessary to achieve compliance with this Order. All systems in service or reserved shall be inspected and maintained on a regular basis. Records of inspections and maintenance shall be retained and made available to the Regional Water Board on request.

4. **Reporting of Noncompliance.** The Discharger shall report any noncompliance that may endanger human health or the environment,

including spills in excess of one thousand (1,000) gallons occurring within the Facility or collection system. Information shall be provided orally to the Regional Water Board office and the Office of Emergency Services within twenty-four (24) hours of when the Discharger becomes aware of the incident. If noncompliance occurs outside of business hours, the Discharger shall leave a message on the Regional Water Board's office voicemail. A written report shall also be provided within five business days of the time the Discharger becomes aware of the incident. The written report shall contain a description of the noncompliance and its cause, the period of noncompliance, the anticipated time to achieve full compliance, and the steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance. A final certified report must be submitted through the online GeoTracker system, within 15 calendar days of the conclusion of spill response and remediation. Additional information may be added to the certified report, in the form of an attachment, at any time. All other forms of noncompliance shall be reported with the Discharger's next scheduled Self-Monitoring Report (SMR), or earlier if requested by the Regional Water Board's Executive Officer or if required by an applicable standard for sludge use and disposal.

5. **Duty to Mitigate.** The Discharger shall take all reasonable steps to minimize or prevent any discharge in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment.

6. **Material Changes.** Prior to any modifications which would result in any material change in the quality or quantity of wastewater treated or discharged, or any material change in the location of discharge, the Discharger shall report all pertinent information in writing to the Regional Water Board, and if required by the Regional Water Board, obtain revised requirements before any modifications are implemented.

7. **Design Capacity Report.** The Discharger shall provide a report to the Regional Water Board when it determines that the Facility's average dry-weather flow rate for any month exceeds 80 percent of the design capacity. The report should indicate what steps, if any, the Discharger intends to take to provide for the expected wastewater treatment capacity necessary when the plant reaches design capacity.

8. **Operational Personnel.** The Facility shall be supervised and operated by persons possessing certification of appropriate grade pursuant to section 3680, chapter 26, division 3, title 23 of the California Code of Regulations.

9. **Familiarity with Order.** The Discharger shall ensure that all site-operating personnel are familiar with the content of this Order and maintain a copy of this Order at the site.

10. **Inspection and Entry.** The Discharger shall allow the Regional Water Board, or an authorized representative, upon presentation of credentials and other documents as may be required by law, to:

    a. Enter the premises regulated by this Order, or the place where records are kept under the conditions of this Order;

    b. Have access to and copy, at reasonable times, records kept under the conditions of this Order;

    c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order; and

    d. Sample or monitor at reasonable times, for the purpose of assuring compliance with this Order or as otherwise authorized by the Water Code, any substances or parameters at this location.

11. **Records Retention.** The Discharger shall retain copies of all reports required by this Order and the associated MRP. Records shall be maintained for a minimum of five years from the date of the sample, measurement, report, or application. Records may be maintained electronically. This period may be extended during the course of any unresolved litigation regarding this discharge or when requested by the Regional Water Board's Executive Officer.

12. **Change in Ownership.** This Order is not transferable to any person without written approval by the Regional Water Board's Executive Officer. Prior to any change in ownership of this operation, the Discharger shall notify the Regional Water Board's Executive Officer in writing at least 30 days in advance. The notice must include a written transfer agreement between the existing owner and the new owner. At a minimum, the transfer agreement must contain a specific date for transfer of responsibility for compliance with this Order and an acknowledgment that the new owner or operator is liable for compliance with this Order from the date of transfer. The Regional Water Board may require modification or revocation and reissuance of this Order to change the name of the Discharger and incorporate other requirements as may be necessary under the Water Code.

13. **Bypass.** Bypass (i.e., the intentional diversion of waste streams from any portion of the treatment facilities, except diversions designed to meet variable effluent limits) is prohibited. The Regional Water Board may take enforcement action against the Discharger for bypass unless:

    a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage. Severe property damage means substantial physical damage to property, damage to the treatment

facilities that causes them to be inoperable, or substantial and permanent loss of natural resources reasonably expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in fee collection; and

b. There were no feasible alternatives to bypass, such as the use of auxiliary treatment facilities or retention of untreated waste. This condition is not satisfied if adequate back-up equipment was not installed to prevent bypass occurring during equipment downtime, or preventative maintenance; or

c. Bypass is (1) required for essential maintenance to ensure efficient operation; (2) neither effluent nor receiving water limitations are exceeded and (3) the Discharger notifies the Regional Water Board ten (10) days in advance.

In the event of an unanticipated bypass, the Discharger shall immediately report the incident to the Regional Water Board. During non-business hours, the Discharger shall leave a message on the Regional Water Board's office voicemail. A written report shall be provided within five (5) business days after the Discharger is aware of the incident. The written report shall include a description of the bypass, any noncompliance, the cause, period of noncompliance, anticipated time to achieve full compliance, and steps taken or planned to reduce, eliminate, and prevent recurrence of the noncompliance.

14. **Backup Generators.** Standby, power generating facilities shall be available to operate the Facility during a commercial power failure.

15. **Format of Technical Reports.** The Discharger shall furnish, under penalty of perjury, technical monitoring program reports, and such reports shall be submitted in accordance with California Code of Regulations, title 23, division 3, chapter 30, as raw data uploads electronically over the Internet into the State Water Board's GeoTracker database. Documents that are normally mailed by the Discharger to the Regional Water Board, such as regulatory documents, narrative monitoring reports or materials, and correspondence, shall also be uploaded into GeoTracker in the appropriate Microsoft Office software application format, such as Word or Excel files, or as a Portable Document Format (PDF) file. Large documents must be split into appropriately-labelled, manageable file sizes and uploaded into GeoTracker.

16. **Qualified Professionals.** In accordance with Business and Professions Code sections 6735, 7835, and 7835.1, engineering and geologic evaluations and judgments shall be performed by or under the direction of California registered professionals (i.e., civil engineer, engineering geologist, geologist, etc.) competent and proficient in the fields pertinent to

the required activities. All technical reports required under this Order that contain work plans, describe the conduct of investigations and studies, or contain technical conclusions and recommendations concerning engineering and geology shall be prepared by or under the direction of appropriately-qualified professional(s), even if not explicitly stated. Each technical report submitted by the Discharger shall contain a statement of qualifications of the responsible licensed professional(s) as well as the professional's signature and/or stamp of the seal. Additionally, all field activities are to be conducted under the direct supervision of one or more of these professionals.

17. **Certification Under Penalty of Perjury.** All technical reports required in conjunction with this Order shall include a statement by the Discharger, or an authorized representative of the Discharger, certifying under penalty of perjury under the laws of the State of California, that the reports were prepared under his or her supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted, and that based on his or her inquiry of the person or persons who manage the system, the information submitted is, to the best of his or her knowledge and belief, true, complete, and accurate.

18. **Violation of Law.** This Order does not authorize violation of any federal, state, or local laws or regulations.

19. **Property Rights.** This Order does not convey property rights of any sort, or exclusive privileges, nor does it authorize injury to private property or invasion of personal rights.

20. **Modification, Revocation, Termination.** This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for an Order modification, rescission, or reissuance, or the Discharger’s notification of planned changes or anticipated noncompliance, does not stay any Order condition. Causes for modification include, but are not limited to, the violation of any term or condition contained in this Order, a material change in the character, location, or volume of discharge, a change in land application plans or sludge use/disposal practices, or the adoption of new regulations by the State Water Board, Regional Water Board (including revisions to the Basin Plan), or federal government.

21. **Severability.** The provisions of this Order are severable. If any provision of this Order is found invalid, the remainder of these requirements shall not be affected.

Any person aggrieved by this Regional Water Board action may petition the State Water Board for review in accordance with Water Code section 13320 and California Code of Regulations, title 23, section 2050 et seq. The State Water

Board must receive the petition by 5:00 p.m. on the 30th day after the date of this Order; if the 30th day falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the statutes and regulations applicable to filing petitions are available on the State Water Board's website and can be provided upon request.

MONITORING AND REPORTING PROGRAM R7-2021-0023
FOR
BIG BEAR AREA REGIONAL WASTEWATER AGENCY, OWNER/OPERATOR
EXPORT OF RECYCLED WATER TO LUCERNE VALLEY
LUCERNE VALLEY-SAN BERNARDINO COUNTY

This Monitoring and Reporting Program (MRP) is issued pursuant to Water Code section 13267 and describes requirements for monitoring the relevant wastewater system and groundwater quality. The Discharger shall not implement any changes to this MRP unless and until a revised MRP is issued by the Regional Water Board or its Executive Officer.

The Discharger owns and operates the wastewater treatment system that is subject to Order R7-2021-0023. The reports required herein are necessary to ensure that the Discharger complies with the Order. Pursuant to Water Code section 13267, the Discharger shall implement the MRP and shall submit monitoring reports described herein.

A. Sampling and Analysis General Requirements

1. **Testing and Analytical Methods.** The collection, preservation, and holding times of all samples shall be in accordance with U.S. Environmental Protection Agency (USEPA)-approved procedures. All analyses shall be conducted in accordance with the latest edition of either the USEPA's *Guidelines Establishing Test Procedures for Analysis of Pollutants Under the Clean Water Act* (40 C.F.R. part 136) or *Test Methods for Evaluating Solid Waste: Physical/Chemical Methods Compendium* (SW-846), unless otherwise specified in the MRP or approved by the Regional Water Board's Executive Officer.

2. **Laboratory Certification.** All analyses shall be conducted by a laboratory certified by the State Water Board, Division of Drinking Water's Environmental Laboratory Accreditation Program (ELAP), unless otherwise approved by the Regional Water Board's Executive Officer.

3. **Reporting Levels.** All analytical data shall be reported with method detection limits (MDLs) and with either the reporting level or limits of quantitation (LOQs) according to 40 Code of Federal Regulations part 136, Appendix B. The laboratory reporting limit for all reported monitoring data shall be no greater than the practical quantitation limit (PQL).

4. **Sampling Location(s).** Samples shall be collected at the location(s) specified in the WDRs. If no location is specified, sampling shall be conducted at the most representative sampling point available.

5. **Representative Sampling.** All samples shall be representative of the volume and nature of the discharge or matrix of material sampled. The time, date, and location of each grab sample shall be recorded on the chain of custody form for the sample. If composite samples are collected, the basis for sampling (time or flow weighted) shall be approved by Regional Water Board staff.

6. **Instrumentation and Calibration.** All monitoring instruments and devices used by the Discharger shall be properly maintained and calibrated to ensure their continued accuracy. Any flow measurement devices shall be calibrated at least once per year to ensure continued accuracy of the devices. In the event that continuous monitoring equipment is out of service for a period greater than 24 hours, the Discharger shall obtain representative grab samples each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. The Discharger shall report the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.

7. **Field Test Instruments.** Field test instruments (such as those used to test pH, dissolved oxygen, and electrical conductivity) may be used provided that:

    a. The user is trained in proper use and maintenance of the instruments;

    b. The instruments are field calibrated prior to monitoring events at the frequency recommended by the manufacturer;

    c. Instruments are serviced and/or calibrated by the manufacturer at the recommended frequency; and

    d. Field calibration reports are submitted.

8. **Records Retention.** The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, for a minimum of five (5) years from the date of the sampling or measurement. This period may be extended by request of the Regional Water Board's Executive Officer at any time. Records of monitoring information shall include:

a. The date, exact place, and time of sampling or measurement(s);

b. The individual(s) who performed the sampling or measurement(s);

c. The date(s) analyses were performed;

d. The individual(s) who performed the analyses;

e. The analytical techniques or method used; and

f. All sampling and analytical results, including:

i. units of measurement used;

ii. minimum reporting limit for the analyses;

iii. results less than the reporting limit but above the method detection limit (MDL);

iv. data qualifiers and a description of the qualifiers;

v. quality control test results (and a written copy of the laboratory quality assurance plan);

vi. dilution factors, if used; and

vii. sample matrix type.

9. **Inoperative Facility.** If the Facility is not in operation, or there is no discharge during a required reporting period, the Discharger shall forward a letter to the Regional Water Board indicating that there has been no activity during the required reporting period.

B. Effluent Monitoring

1. Representative samples of the undisinfected secondary recycled water shall be taken at the WWTP. The samples shall be analyzed for the following constituents and according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Irrigation Flow	MGD	Flow Meter Reading	Daily	Monthly

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
20°C BOD_5[8]	mg/L	24 Hr. Composite	2x/Month	Monthly
Total Suspended Solids (TSS)	mg/L	24 Hr. Composite	2x/Month	Monthly
pH	s.u.[9]	Grab	Daily	Monthly
Dissolved Oxygen[10]	mg/L	Grab	Monthly	Monthly
Total Dissolved Solids (TDS)	mg/L	24 Hr. Composite	Monthly	Monthly
Sulfate	mg/L	24 Hr. Composite	Monthly	Monthly
Chloride	mg/L	24 Hr. Composite	2x/Month	Monthly
Fluoride	mg/L	24 Hr. Composite	Monthly	Monthly
Nitrate as N	mg/L	24 Hr. Composite	Monthly	Monthly
Total Nitrogen	mg/L	24 Hr. Composite	Monthly	Monthly
E. Coli	MPN/100mL[11]	Grab	Monthly	Monthly
Volatile Organic Compounds (VOCs)	µg/L[12]	24 Hr. Composite	Annually	Annually

[8] 5-Day Biochemical Oxygen Demand at 20 degrees Celsius.

[9] Standard pH units

[10] Dissolved Oxygen shall be monitored at the upper one-foot layer of the storage or percolation ponds.

[11] Most Probable Number per 100 milliliters.

[12] Micrograms per liter

C. Overflow Pond Monitoring

1. During months when the overflow evaporation/percolation ponds are not used, the Discharger shall report that there has been no activity. During months when the overflow evaporation/percolation ponds are in use, the ponds shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Flow	MGD	Flow Measurement	Daily	Monthly
Dissolved Oxygen	mg/L	Grab	2x/Month	Monthly
pH	s.u.	Grab	2x/Month	Monthly
Total Dissolved Solids	mg/L	Grab	2x/Month	Monthly
Freeboard	ft	Measurement	2x/Month	Monthly

D. Domestic Water Supply Monitoring

1. The domestic water supply shall be a flow weighted composite sample monitored at the water supply production wells in Big Bear Valley and include notations of which wells are non-operating for a reporting period and monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Total Dissolved Solids	mg/L	Grab	Quarterly	Quarterly
General Minerals[13]	mg/L	Grab	Annually	Annually

[13] General Minerals shall include: total dissolved solids, calcium, chloride, fluoride, iron, magnesium, manganese, nitrate, potassium, sodium, sulfate, barium, total alkalinity (including alkalinity series), and hardness.

E. Groundwater Monitoring

1. The groundwater monitoring wells shall be monitored according to the following schedule:

Constituent	Units	Type of Sample	Monitoring Frequency	Reporting Frequency
Depth to Groundwater	ft (msl)[14]	Measurement	Quarterly	Quarterly
Groundwater Gradient[15]	NA	Direction	Quarterly	Quarterly
Total Nitrogen	mg/L	Grab	Quarterly	Quarterly
Nitrate as N	mg/L	Grab	Quarterly	Quarterly
Chloride	mg/L	Grab	Quarterly	Quarterly
Fluoride	mg/L	Grab	Quarterly	Quarterly
Sulfate	mg/L	Grab	Quarterly	Quarterly
E. Coli	MPN/100mL	Grab	Quarterly[16]	Quarterly
Total Dissolved Solids	mg/L	Grab	Quarterly	Quarterly
Boron	mg/L	Grab	Quarterly	Quarterly
VOCs	μg/L	Grab	Annually	Annually

F. Reporting Requirements

1. Daily, weekly, and monthly monitoring shall be included in the Monthly Self-Monitoring Reports (SMRs). Monthly SMRs shall be submitted by the **15th day of the following month.** Quarterly SMRs shall be submitted by

[14] Above mean sea level.

[15] Groundwater flow direction.

[16] After two years of groundwater monitoring that show consistent negligible impacts to groundwater, the Discharger may request to have the monitoring schedule revised with Executive Officer approval.

January 15th, April 15th, July 15th, and October 15th. Annual SMRs shall be submitted by **January 31st** of the following year.

2. SMRs shall include, at a minimum, the following:

   a. **Cover Letter.** A transmittal letter summarizing the essential points in the report.

   b. **Maps.** Maps depicting the Facility layout and the location of sampling points.

   c. **Summary of Monitoring Data.** Tables of the data collected. The tables shall include all of the data collected to-date at each monitoring point, organized in chronological order, with the oldest data in the top row and progressively newer data in rows below the top row. Each row shall be a monitoring event and each column shall be a separate parameter at a single location (or a single average, as appropriate).

   d. **Graphical Display.** Graphs depicting monitoring parameters through time, with the concentrations being the y-axis and time being the x-axis. Logarithmic scales can be used for values that vary by orders of magnitude. Individual graphs can combine multiple locations or multiple chemicals if that allows the data to be compared more easily.

   e. **Compliance Summary.** Identification of any violations found since the last report was submitted, and actions taken or planned for correcting each violation. If the Discharger previously submitted a report describing corrective actions and/or a time schedule for implementing the corrective actions, reference to the previous correspondence will be satisfactory. If no violations have occurred since the last submittal, this shall be stated.

3. SMRs shall be certified under penalty of perjury to be true and correct. Each SMR submitted to the Regional Water Board shall contain the following completed declaration:

   “I declare under the penalty of law that I have personally examined and am familiar with the information submitted in this document, and that based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

   Executed on the _____day of _____ at _____

_____(Signature)

_____(Title)"

4. The SMRs and any other information requested by the Regional Water Board shall be signed by a principal executive officer or ranking elected official. A duly authorized representative of the Discharger may sign the documents if:

    a. The authorization is made in writing by the person described above;

    b. The authorization specified an individual or person having responsibility for the overall operation of the regulated disposal system; and

    c. The written authorization is submitted to the Regional Water Board's Executive Officer.

5. The results of any analysis taken more frequently than required at the locations specified in this MRP shall be reported to the Regional Water Board.

6. As specified in Standard Provision F.15, technical reports shall be prepared by or under the direction of appropriately qualified professional(s). Each technical report submitted shall contain a statement of qualification of the responsible licensed professional(s) as well as the professional's signature and/or stamp of the seal.

7. As specified in Standard Provision F.14, the Discharger shall comply with Electronic Submittal of Information (ESI) requirements by submitting all correspondence and reports required under MRP R7-2021-0023 and any future revision(s) hereto, including groundwater monitoring data and discharge location data (latitude and longitude), correspondence, and PDF monitoring reports to the State Water Board's Geotracker database. Documents too large to be uploaded into Geotracker should be broken down into smaller electronic files and labelled properly prior to uploading into Geotracker.

RESOLUTION NO. 94-63

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF BIG BEAR LAKE, COUNTY OF SAN BERNARDINO, STATE OF CALIFORNIA, AFFIRMING THE CITY OF BIG BEAR LAKE'S RIGHT TO REUSE TREATED WASTEWATER IN BIG BEAR VALLEY

WHEREAS, the wastewater generated within the City of Big Bear Lake is collected and transmitted to the Big Bear Area Regional Wastewater Agency (BBARWA) treatment plant; and

WHEREAS, the water generated within the City of Big Bear Lake is derived from ground water extracted from local ground water basins; and

WHEREAS, the BBARWA treatment plant treats said wastewater and then transmits the treated wastewater to Lucerne Valley in BBARWA's "outfall pipeline"; and

WHEREAS, BBARWA owns a section of land in Lucerne Valley upon which said treated wastewater is beneficially utilized for irrigation of alfalfa and other crops; and

WHEREAS, the City of big Bear Lake's Department of Water & Power has developed plans to reuse a significant portion of the City's wastewater in a project referred to as: "The Sand Canyon Wastewater Reuse Project"; and

WHEREAS, the City is aware of a water adjudication proceeding which involves the Lucerne Valley area; and

WHEREAS, the City wants to notify the adjudication's proposed water master, the Mojave Water Agency, that the wastewater that originates in Big Bear Valley and is utilized for irrigation in Lucerne Valley, is the property of the people of Big Bear Valley and part or all of the wastewater will be reused in Big Bear Valley for the benefit of the people of Big Bear Valley.

NOW, THEREFORE, BE IT RESOLVED, that the enclosed letter to the Mojave Water Agency is hereby approved and the Special Counsel is authorized to sign and transmit said letter.

PASSED, APPROVED AND ADOPTED this 21st day of December, 1994.

AYES:	Foulkes, Hertzmann, Mellen, Shoettger, Walker
NOES:	None
ABSENT:	None

December 21, 1994
Date

Neal Hertzmann, Mayor

ATTEST:

Katherine E. Jefferies
City Clerk

STATE OF CALIFORNIA)
COUNTY OF SAN BERNARDINO) ss
CITY OF BIG BEAR LAKE)

I, Katherine E. Jefferies, City Clerk of the City of Big Bear Lake, California, do hereby certify that the whole number of the City Council of the said City is five; that the foregoing Resolution, being Resolution No. 94-63 was duly passed and adopted by the said City Council and attested by the City Clerk of said city, all at a regular meeting of the said Council held on the 21st day of December, 1994, and that the same was so passed and adopted by the following vote:

AYES:	Foulkes, Hertzmann, Mellen, Schoettger, Walker
NOES:	None
ABSENT:	None

Witness my hand and the official seal of said City this 21st day of December, 1994.

Katherine E. Jefferies
City Clerk

January 10, 1995

RE: Mojave Basin Area Adjudication

Dear Mr. Lemieux:

The Mojave Water Agency is in receipt of your letter dated December 23, 1994 regarding the Mojave Basin Area Adjudication. Your letter seeks clarification regarding reliance by MWA upon reclaimed water produced by the Big Bear Area Regional Wastewater Agency (BBARWA) to balance the Lucerne Valley Basin. Your letter infers that due to the water rights adjudication which includes the Lucerne Valley, a legal claim will be made to the reclaimed water for use in Lucerne Valley.

The Stipulated Judgment, in its current form, requires that the Court appointed Watermaster annually assess the water supply yield of the five subareas within the adjudicated basins. The annual determination of yield, following a prescribed water production "ramp-down" process, will establish the quantity of water that can be pumped from the basin without replacement by supplemental water. The annual determination of yield would be based upon a total hydrologic inventory of supplies which, by definition, would include return flows from wastewater applied to agriculture by BBARWA in Lucerne Valley, as is the current practice. To the extent that return flows are available in the future, those values would continue to be included in the annual hydrologic inventory by the Watermaster's engineer.

The inclusion of the BBARWA wastewater flow in the annual yield calculation does not result in an adjudicated water right or claim to that source of water supply by the Mojave Water Agency, the Watermaster or the parties to the adjudication, since BBARWA has not been named as a party to the Adjudication. Should the method of disposal from BBARWA change at some future date, the net effect could be a reduction in yield to the basin and consequently an increased need for supplemental water supply from other sources.

Re: *City of Barstow, et al. v. City of Adelanto, et al.*
Riverside County Superior Court, Case No. 208568

Dear Mr. Brunick:

I have reviewed your March 14, 1995 letter to me as well as Mr. Rowe's January 10, 1995 letter to Wayne Lemieux. I do believe that the two letters contain the fabric from which a solution can be crafted. As I noted in my letter to Mr. Rowe, the goal is not to upset the proposed Stipulated Judgment. The City of Big Bear Lake and other Big Bear Area Regional Wastewater Agency ("BBARWA") members only want reasonable assurances that the proposed Stipulated Judgment, once it is adopted and Ordered by the court, cannot be utilized by anyone, in any way, as a means to block the reclamation of water now exported to the Lucerne Valley for re-use within Big Bear Valley.

As I read Mr. Rowe's letter to Mr. Lemieux, the Mojave Water Agency ("MWA") understands the judgment to provide that the Watermaster shall annually assess the water supply of the five subareas within the adjudicated basin; that based upon this annual determination, the Watermaster will establish the quantity of water that can be pumped from each basin, assuming the absence of supplemental water. The annual determination of yield is based upon a total calculation of the available water supplies which would include, so long as they continue, return flows from wastewater applied to agricultural lands within Lucerne Valley by BBARWA. It is my understanding that return flows are assumed to be 50% of applied water.

I glean from Mr. Rowe's letter two main concepts of significance to the City of Big Bear Lake. First, the proposed Stipulated Judgment only controls the quantity of water that can be pumped from the respective basins. The proposed Stipulated Judgment does not compel the addition of supplemental water, nor does it compel an entity to continue to import water. Thus, BBARWA would be free, at any time, to cease its importation of wastewater into Lucerne Valley.

The second concept is that the practical impact this would have on the application of the provisions of the proposed Stipulated Judgment would be a reduced quantity of return flow calculated as part of the annual water availability figures and a potential reduction in pumping local basins.

In addition to these two concepts, and, perhaps derived from them, it is my understanding that no party considers the inclusion of the BBARWA wastewater flow in annual yield calculations as an adjudication or claim to that supply. Instead, they only consider it to be an accounting for that supply so long as it is imported to the basin. Moreover, since BBARWA is not a party to the adjudication, it cannot be bound by the adjudication or by the proposed Stipulated Judgment.

Finally, in this regard, you have represented to me that Bill Dendy and other witnesses have specifically testified on this matter in their discussion of Exhibit C-1. This testimony, I believe, includes reference to the fact that Exhibit C-1, appended to the proposed Stipulated Judgment, is clearly marked as an example and that the exhibit itself will be modified, on an annual basis, to reflect changed circumstances, as would be the case if the importation of wastewater to Lucerne Valley by BBARWA ceases.

Assuming the foregoing accurately reflects MWA's understanding of the situation, I believe that the matter could be resolved through the execution of a simple letter agreement or MOU between MWA, as the proposed Watermaster under the proposed Stipulated Judgment, and BBARWA and the City of Big Bear Lake memorializing this understanding. Indeed, I believe a letter from the MWA, as the proposed Watermaster under the proposed Stipulated Judgment, acknowledging and concurring in the foregoing, might well be sufficient.

On a directly related topic, to the extent it is available, I would appreciate it if you could forward to me the Dendy and related testimony discussed above and noted within your letter. Also, under the proposed Stipulated Judgment, is the 50% assumed return flow from BBARWA Lucerne Valley lands conclusively presumed or is it a calculated number that may vary?

I hope that what I have proposed above resolves the situation. Your immediate attention to this matter is essential. Please do not hesitate to contact me if you have any questions or need additional information.

Very truly yours,

Stuart L. Somach
Attorney

Attn: Stuart L. Somach

RE: City of Barstow, et al. v. City of Adelanto, et al.
Riverside Superior Court Case No. 208568

Dear Stuart:

In response to your letter of March 15, 1995, please find enclosed testimony of Jim Hansen and Bill Dendy regarding Exhibit C-1. I believe the best explanation of the Judgment is the Judgment itself. I have enclosed a copy of the stipulated Judgment for your review. It should be made clear that the Court may change the terms of the Stipulated Judgment if the Court decides to impose a different physical solution. We should have some idea as to the position of the Court on April 10, 1995.

I believe my letter of March 14, 1995 and Mr. Rowe's letter of January 10, 1995 states the position of the Mojave Water Agency as to the reclamation of water discharge by Big Bear Area Regional Waste Water Agency in Lucerne Valley. The inclusion of this discharge on Exhibit C-1 is an example only.

This exhibit will be modified to reflect changed circumstances as would be the case if the importation of waste water to Lucerne Valley by BBARWA ceases. Moreover, since BBARWA is not a party to the adjudication, I do not see how it could be bound by the adjudication or terms of the Stipulated Judgment.

If you desire further clarification of the Mojave Water Agency's position in this matter, please contact this office.

Very truly yours,

BRUNICK, ALVAREZ & BATTERSBY

about.

What is this basically, and what's its purpose, Mr. Dendy?

A This was a table labeled C-1. It appears in Appendix C of the stipulated judgment.

Q I'll stop you there.

This Table C-1, is this exactly the same as Table C-1 in the judgment, which is Exhibit 4001?

A No, it isn't.

Q Why? What's the difference?

A When that was prepared, the process of verification of production was still in progress. And we always knew that as when final figures were obtained that there would have to be an amendment to show some adjustment in this table to reflect the fact that some production had not been verified and perhaps some additional use is found. And so this table is the latest update of that, probably the final one, as far as I know.

Q Okay.

Let's take a look at what's on here. What's reflected -- what -- What does "water supply" mean as reflected in this table?

A Water supply here refers to the -- what is the long-term average water supply that's expected to exist over the next -- in the future. It's based -- the natural sources of supply are based upon the sixty-year long-term average annual natural water supply of water to the basin.

Q Okay. Let's stop for a second before you run

way far ahead of these concepts.

Why does this table utilize an average when you're talking about water supply coming into a subarea?

A The -- When dealing with a large groundwater basin, or basins as we are, there's a huge amount of water in storage. And the water supply is highly variable from year to year. There can be very wet years in which a lot of water is put into storage. There can be very dry years, series of dry years in which very little, if any, water goes into storage. The use of the water to support an economy can't rely on that kind of variability. The economy of water used by people and farmers, industry, needs to be fairly predictable and stable. And so by using the long-term storage capacity of the basins, the water in storage can be allowed to fluctuate up and down over time. But as long as the average usage doesn't exceed the average net supply, it should remain in balance.

Q Is the average net supply calculated over a typical period of wet and dry years?

A In this case, as in other cases and other basins, you use the best record you have. And what we happen to have here is sixty years of pretty good record as to what the water supply has been. Because it included some series -- long series of wet years. There's some very extreme wet years. It's included some extended periods of drought, very dry years. Both kinds of years as well as some more or less average years are included in the record. Hydrologists believe it is representative of what

can be relied on for long-term average.

Q And now in that average year you have different types of water supply as I see this. I think the court has heard testimony on all about imports. I don't recall much testimony on imports. What are those two imports down at the bottom of that column, Mr. Dendy?

A These imports represent the -- that's wastewater from two sources, Lake Arrowhead Community Services District and the Big Bear Area Regional Wastewater Authority, which for the past several years have been exported from those areas and disposed of in the Mojave Basin area. For purposes of projecting water supply available in the future the assumption made here is that those discharges will continue. We actually suspect that they will increase. But all we know right now is that they are at this level, and so that's the number we've used to project as being available in the future as part of the water supply.

Q Are these waters deposited somewhere in this basin area just as the VVWRA waters are deposited after sewage treatment?

A I believe some of the water is just disposed of in percolation basins. It doesn't go to the river directly.

Q Yes.

A And some is actually applied for use.

Q Now, could this net average water supply as we go through the administration of this judgment out into

the future, could that average change under changed circumstances? Would it have to be recomputed?

A The first three items, surface water inflow, subsurface inflow, and deep percolation precipitation will not change. It's highly unlikely that the sixty-year average of those items is going to be changed in the future.

Q How about the imports?

A The imports could change. As I say, the most likely thing is they might go up. These people might find someplace else to dispose of their wastewater outside the Mojave Basin area. If they did, those numbers would have to be taken off and a new calculation.

Q If a new import came on line through a contract, would you take that into account?

A If -- Yes. If we believed that it was going to be a reliable supply in the future, it should be added in here.

Q Okay.

Now, getting down to consumptive use and outflow, starting with consumptive use, what is consumptive use differentiated from water production or water produced?

A Well, consumptive use refers to the -- the best word I can use is evaporation. It is water that is lost from the system permanently by evaporation into the air.

Q It's not synonymous -- It's not equal to production?
